Hi,

Attached are the final files for perched river seepage. The *.csv and shapefiles that Jennifer was using to test the tools are just fine, but I did rename these files so that we know these are the most updated. So, no change was needed in the actual data, but I did update the field "Reach" so that the names in the shapefile matched the *.pch water budget file.

The *.pch data also checked out just fine is the most up-to-date. The water budget file E110406A.pch is the appropriate file to be using.

Subject: Final TRB data

Hi,

Attached are the final files for trib underflow. The *.csv file and the shapefiles are renamed to yesterday's date (5/5/11) just so that we know that they are the most current and correct; although, the *.csv that Jennifer created with the new "factor" column checked out perfectly with mine. I also checked the shapefile and checked on the splits made in the Henrys Fork and Camas/Beaver and again it matches up with mine. I left the water budget file (E110406A.trb) so as to not create confusion about a new water budget being created, but the one attached is the most up-to-date.

Let me know if you have any questions or problems.

Zach, I just have one minor suggestion on the documentation. Since we've split up 2 groups of features (Rattle Pine - Henrys Fork and Camas - Beaver) you could change the number of "22" individual features to "24" individual features on this page at the bottom: <http://maps.idwr.idaho.gov/ESPAM.Tools/ESPAM-Web-Documentation/formats.html#formats-trb>

I didn't notice anywhere else that needs to be changed.

Stacey
