OFFER OF PROOF ADMITTED
DURING THE 2023 AGENCY METHODOLOGY ORDER HEARING
June 6–9, 2023

Offer of Proof 400—20230530 Pacific Northwest Project Technical Information Memorandum 3200–3224

CV01-23-13173 AGENCY RECORD RESPONSES, CERTIFICATIONS, AND NOTICES

Notice of Lodging the Agency Transcript and Record with the Agency, August 30, 2023 3225–3227

IGWA's Objection to the Agency Record and Transcript, September 13, 2023 3228–3235

Response to Objection; Order Settling the Agency Transcript and Record, September 27, 2023 3236–3241

Agency's Certificate of Record and Exhibits, September 27, 2023 3242–3243

Notice of Lodging the Settled Agency Transcript and Record with the District Court, September 27, 2023 3244–3247

CV06-26-1801 AGENCY RECORD RESPONSES, CERTIFICATIONS, AND NOTICES

Notice of Lodging the Agency Record and Transcript with the Agency, October 7, 2026.....3248–3250

Petitioners' Objection to the Lodged Agency Record, October 21, 2026 3251–3256

Agency Decision on Objection and Order Settling the Agency Record and Transcript, November 4, 2026 3257–3262

Agency's Certificate of Record, November 4, 2026 3263

Notice of Lodging the Settled Agency Record and Transcript with the District Court, November 4, 2026.....3264–3266

INDEX

A&B Irrigation District's Notice of Communication to Water District 01 Watermaster, May 5, 2023 300–306

Agency Decision on Objection and Order Settling the Agency Record and Transcript, November 4, 2026 3257–3262

Agency's Certificate of Record and Exhibits, September 27, 2023 3242–3243

Agency's Certificate of Record, November 4, 2026 3263

Amalgamated Sugar Company's Identification of Witnesses and Exhibits, May 30, 2023 534–537

Amalgamated Sugar Company's Request for Hearing, Objection, Identification of Issues and Notice of Mitigation, May 4, 2023 164–168

Amended Joint Notice of Continued Deposition Duces Tecum of Matthew Anders, P.G. (Day 2), May 25, 2023 520–524

Bingham Ground Water District's Disclosure of Proposed Exhibits, Proposed Witnesses, and Expert Report of Darryll Olsen Ph.D., May 30, 2023 571–599

Bingham Ground Water District's Request for Hearing, May 5, 2023 277–280

Bingham Groundwater District Joinder in IGWA's and Bonneville-Jefferson's Post-hearing Brief, and Supplemental Brief, June 16, 2023 1021–1028

Bonneville-Jefferson Ground Water District's Request for Hearing, May 4, 2023 ..184–188

Bonneville-Jefferson Ground Water District's Statement of Issues, May 5, 2023....272–276

Bonneville-Jefferson's Post-Hearing Brief and Joinder in Support of IGWA's Post-Hearing Brief, June 16, 2023 1005–1020

Bonneville-Jefferson's Witness and Exhibit List, May 30, 2023 600–648

Cities' Amended I.R.C.P. 30(b)(6) Notice of Taking Deposition Duces Tecum of Twin Falls Canal Company, May 22, 2023 465–470

Cities' I.R.C.P. 30(b)(6) Notice of Taking Deposition Duces Tecum of Twin Falls Canal Company, May 19, 2023.....444–449

City of Idaho Falls Challenge and Request for Hearing, May 4, 2023.....179–183

City of Idaho Falls Statement of Issues, May 5, 2023 281–287

City of Idaho Falls, City of Pocatello, and Coalition of Cities;' Amended Joint Disclosure of Proposed Exhibits for Hearing, June 1, 2023 649–655

City of Idaho Falls, City of Pocatello, and Coalition of Cities' Joint Disclosure of Proposed Witnesses for Hearing, May 30, 2023.....548–553

City of Idaho Falls, City of Pocatello, and Coalition of Cities' Joint Disclosure of Proposed Exhibits for Hearing, May 30, 2023 554–560

City of Idaho Falls, City of Pocatello, and Coalition of Cities' Second Amended Joint Disclosure of Proposed Exhibits for Hearing, June 5, 2023 817–886

City of Pocatello, City of Idaho Falls, and Coalition of Cities' Closing Brief, June 16, 2023 967–982

City of Pocatello's, City of Idaho Falls', and Coalition of Cities' Request for Hearing and Order Authorizing Discovery, August 3, 2023 1155–1159

Coalition of Cities' Amended Request for Hearing, August 28, 2023 119–123

Coalition of Cities' Request for Hearing, April 28, 2023.....93–97

Coalition of Cities' Statement of Issues, May 5, 2023 213–218

Declaration of Bryce Contor in Support of Motion for Reconsideration of Denial of Continuance, May 5, 2023.....356–361

Declaration of Candice M. McHugh in Support of Notice of Mitigation, May 4, 2023.....169–172

Declaration of Candice M. McHugh, May 5, 2023 319–322

Declaration of David Colvin, May 23, 2023.....497–504

Declaration of Gregory K. Sullivan, P.E. (in support of Motion for Reconsideration of Denial of Continuance), May 8, 2023 374–387

Declaration of Gregory K. Sullivan, P.E. (in support of the groundwater users' Motion for Reconsideration as to Twin Falls Canal Company's irrigated acres), May 8, 2023 388–402

Declaration of Jaxon Higgs, May 5, 2023 336–339

Declaration of Skyler C. Johns in Support of Motion for Reconsideration of Denial of Continuance, May 5, 2023 362–367

Declaration of Sophia Sigstedt, May 5, 2023 340–347

Declaration of Thane Kindred in Support of Motion for Reconsideration of Denial of Continuance, May 5, 2023 368–373

Department's Response to Groundwater Users' Request for Production and Request for Public Records, May 18, 2023 432–440

Email to the Parties Regarding 2023 Milner and Minidoka Shapefiles, June 6, 2023.....889

BEFORE THE DEPARTMENT OF WATER RESOURCES

OF THE STATE OF IDAHO

IN THE MATTER OF THE DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY AND FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **FIFTH AMENDED FINAL ORDER REGARDING METHODOLOGY FOR DETERMINING MATERIAL INJURY TO REASONABLE IN-SEASON DEMAND AND REASONABLE CARRYOVER**

BACKGROUND

On April 19, 2016, the Director ("Director") of the Idaho Department of Water Resources ("Department") issued his *Fourth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* ("Fourth Methodology Order"). The Fourth Methodology Order: (1) explained how the Director would determine material injury to storage and natural flow water rights of members of the Surface Water Coalition ("SWC")[1]; (2) established methods for quantifying material injury to SWC storage and natural flow water rights as predictive and actual demand shortfalls; (3) established methods for quantifying mitigation obligations by holders of junior priority ground water rights for shortfalls in predictive and actual SWC water demands; and (4) established a method for determining a priority date for curtailment if mitigation obligations are not satisfied.

The processes established in the Fourth Methodology Order for determining material injury are not carved in stone. Updates to the methodology order based on additional data and analyses were always anticipated:

> Recognizing his ongoing duty to administer the State's water resources, the Director should use available data, and consider new analytical methods or modeling concepts, to evaluate the methodology. As more data is gathered and analyzed, the Director will review and refine the process of predicting and evaluating material injury. The methodology will be adjusted if the data supports a change.

[1] The SWC is comprised of A&B District, American Falls Reservoir District #2, Burley Irrigation District, Milner Irrigation District, Minidoka Irrigation District, North Side Canal Company, and Twin Falls Canal Company. Each entity holds separate senior surface natural flow water rights and has separate storage contracts for storage water space in the reservoirs.

Fourth Methodology Order, Conclusion of Law 17; *see also In Matter of Distribution of Water to Various Water Rts. Held By or For Ben. of A & B Irrigation Dist.*, 155 Idaho 640, 645, 315 P.3d 828, 833 (2013) ("[t]he concept of a baseline is that it is adjustable . . . ."). The prediction and determination of rights and obligations of the holders of senior priority and junior priority water rights respectively must: (1) apply the best available science and underlying water data; (2) consider changing climatic and cropping patterns; and (3) adhere to the most recent decisions of the courts related to water administration.

Many of the data sets the Department relied upon in the Fourth Methodology Order have been expanded and now include additional years. Furthermore, the Department now has multiple years of experience with the methodology to better understand the impact of applying steady-state modeling versus transient modeling to determine a curtailment priority date that would supply adequate water to the senior water right holders. The first version of the ESPA groundwater flow model was not calibrated at a time-scale that supported in-season transient modeling. In contrast, the current version was calibrated using monthly stress periods and half-month time steps, a refinement that facilitates in-season transient modeling for calculating the response to curtailment of groundwater use. The purpose of this *Fifth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* ("Fifth Methodology Order") is to update the Director's methodology for determining material injury to storage and natural flow water rights either held by or committed to members of the SWC consistent with the Director's ongoing obligation to use the best available science and information.

FINDINGS OF FACT

I. Overview of the Methodology for Determining Material Injury to Water Rights by Determining Reasonable In-Season Demand and Reasonable Carryover

1. The methodology for determining material injury to water rights by determining reasonable in-season demand ("RISD") and reasonable carryover should be based on updated data, the best available science, analytical methods, and the Director's professional judgment as manager of the state's water resources. In the future, climate may vary and conditions may change; therefore, the methodology may need to be adjusted to consider a different baseline year or years ("BLY") or changes to other components.

2. In-season demand shortfall ("IDS") will be computed by subtracting RISD from the forecast supply ("FS"). In-season demand shortfall is computed using the following equation:

$$IDS = FS - RISD$$

3. If the FS is greater than the RISD, there is no demand shortfall. If the FS is less that the RISD, the negative difference is the demand shortfall. Initially, RISD is equal to the historic demands associated with a BLY as selected by the Director, but will be corrected during the season to account for variations in climate and water supply between the BLY and actual conditions.

4. Reasonable carryover shortfall will be computed by subtracting reasonable carryover from actual carryover, where reasonable carryover is defined as the difference between a baseline year demand ("BD") and projected typical dry year supply. Reasonable carryover shortfall will be computed using the following equation:

Reasonable Carryover Shortfall = Actual Carryover – Reasonable Carryover

5. If actual carryover exceeds the reasonable carryover, there is no reasonable carryover shortfall. In contrast, if reasonable carryover exceeds the actual carryover, the negative difference is the reasonable carryover shortfall.

6. The concepts underlying the selection of the BLY, determination of in-season demand shortfall, and reasonable carryover shortfall will be discussed in detail below.

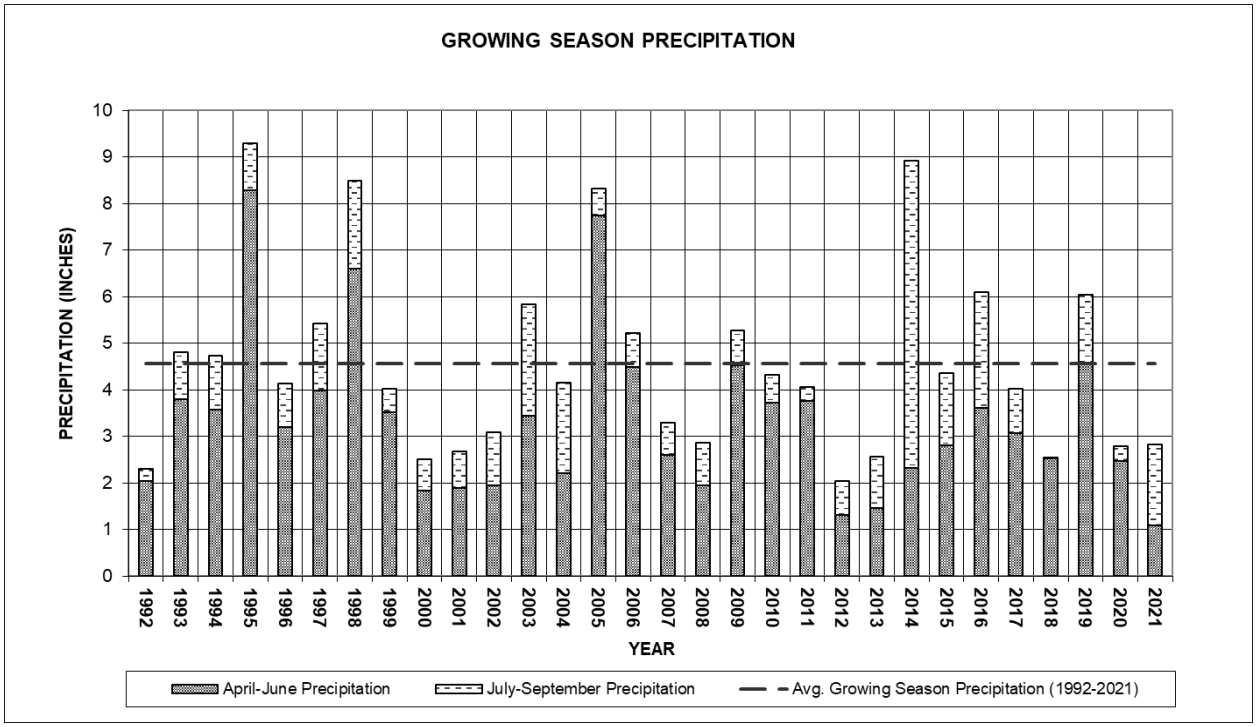
II. In-Season Demand Shortfall

A. Considerations for the Selection of a Baseline Year

7. A BLY is a year or average of years when irrigation demand represents conditions that can predict need in the current year of irrigation at the start of the irrigation season. The purpose of predicting need is to estimate material injury.

8. A BLY is selected by analyzing three factors: (1) climate; (2) available water supply; and (3) irrigation practices. R. Vol. 37 at 7098.[2] To capture current irrigation practices, identification of a BLY is limited to years subsequent to 1999. *Id*. at 7096.

9. The historic diversion volumes from the BLY and the predicted supply forecast at the start of the irrigation season are inputs to predict the initial ISD, where a demand shortfall is the difference between the BD and the FS. When the difference is a negative number, the ISD is zero. ISD increases with increases in BD, decreases in FS, or both. Assuming constant irrigation practices, crop distributions, and total irrigated acres, demand for irrigation water typically increases in years of higher temperature, higher reference evapotranspiration ("ET"), and lower precipitation. If water demand data is averaged for several years and these averages are the basis to predict demand shortfall at the start of the season, in a high-water demand year, these averages may often under-predict the demand shortfall. In a high-water demand year, under-prediction of IDS might be acceptable if the junior priority ground water right holders and the senior priority surface water right holders shared equally in the risk of water shortages. Equality in sharing the risk will not adequately protect the senior priority surface water right holder from injury. Actual demand shortfalls to a senior surface water right holder resulting from predictions at the start of the irrigation season based on average data unreasonably shifts the risk of shortage to the senior surface water right holder. Therefore, a BLY should represent a



[2] All citations in this Order are to material that was admitted during the original hearing and is part of the final agency record on appeal in Gooding County Case No. CV-2008-551, which was lodged with the Fifth Judicial District Court on February 6, 2009.

year(s) of above average diversions and should not represent a year(s) of average or below average diversions. An above average diversion year(s) selected as the BLY should also represent a year(s) of above average temperatures and reference ET, and below average precipitation to ensure that increased diversions were a function of crop water need and not other factors. In addition, actual supply should be analyzed to assure that the BLY is not a year of limited supply.

i. Climate

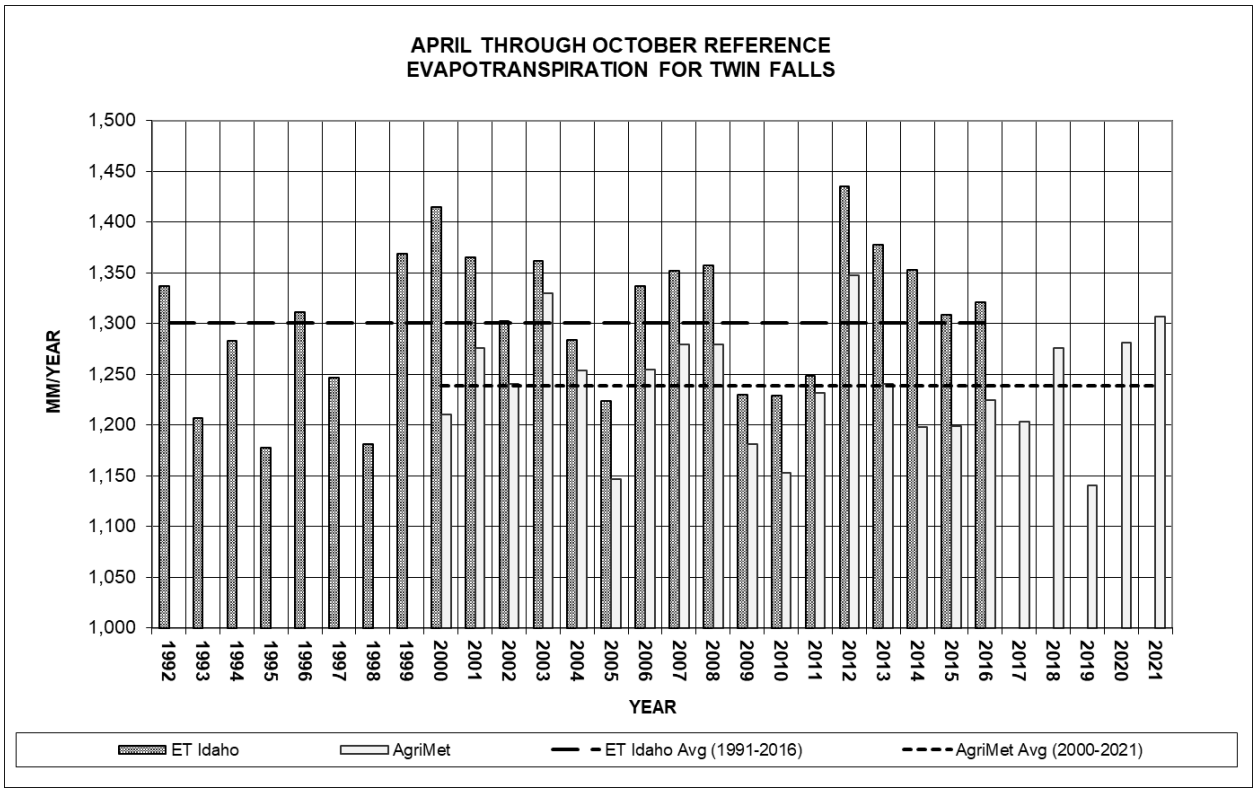
10. For the methods outlined herein, climate is represented by precipitation, reference ET, and growing degree days.

11. Precipitation. Water, in all phases, introduced to Idaho from the atmosphere is termed precipitation. During the growing season, precipitation reduces the irrigation water needed for growing crops. Ex. 3024 at 19. The figure below shows the precipitation recorded during the growing season at the National Weather Service's Twin Falls weather station.

Growing Season Precipitation at National Weather Service's Twin Falls Weather Station 1992–2021.[3]

[3] The Fourth Methodology Order included data for the period 1990 through 2014. This Fifth Methodology Order updates this chart with data for the period 1992 to 2021. The chart is created from NOAA National Weather Service total precipitation data obtained from the NCDC's Climatological Data Annual Summary Idaho report series for the Twin Falls 6 E and Twin Falls Sun Valley Regional Airport weather stations.

12. Evapotranspiration. ET is a variable representing both the amount of water that transpires from vegetation and the amount of water that evaporates from the underlying soil. ET is an important factor for properly estimating RISD. In its water budget calculations, the SWC proposed the use of ET values from the USBR as part of their Pacific Northwest Cooperative Agricultural Network, i.e. AgriMet. Ex. 8000, Vol. II, Chap. 9; Ex. 8000, Vol. IV, Appdx. AU. The ground water users proposed the use of ET values from Richard G. Allen and Clarence W. Robison 2007, Evapotranspiration and Consumptive Irrigation Water Requirements for Idaho, i.e. ETIdaho. Ex. 3007A at 21; Ex. 3024 at 1-58.



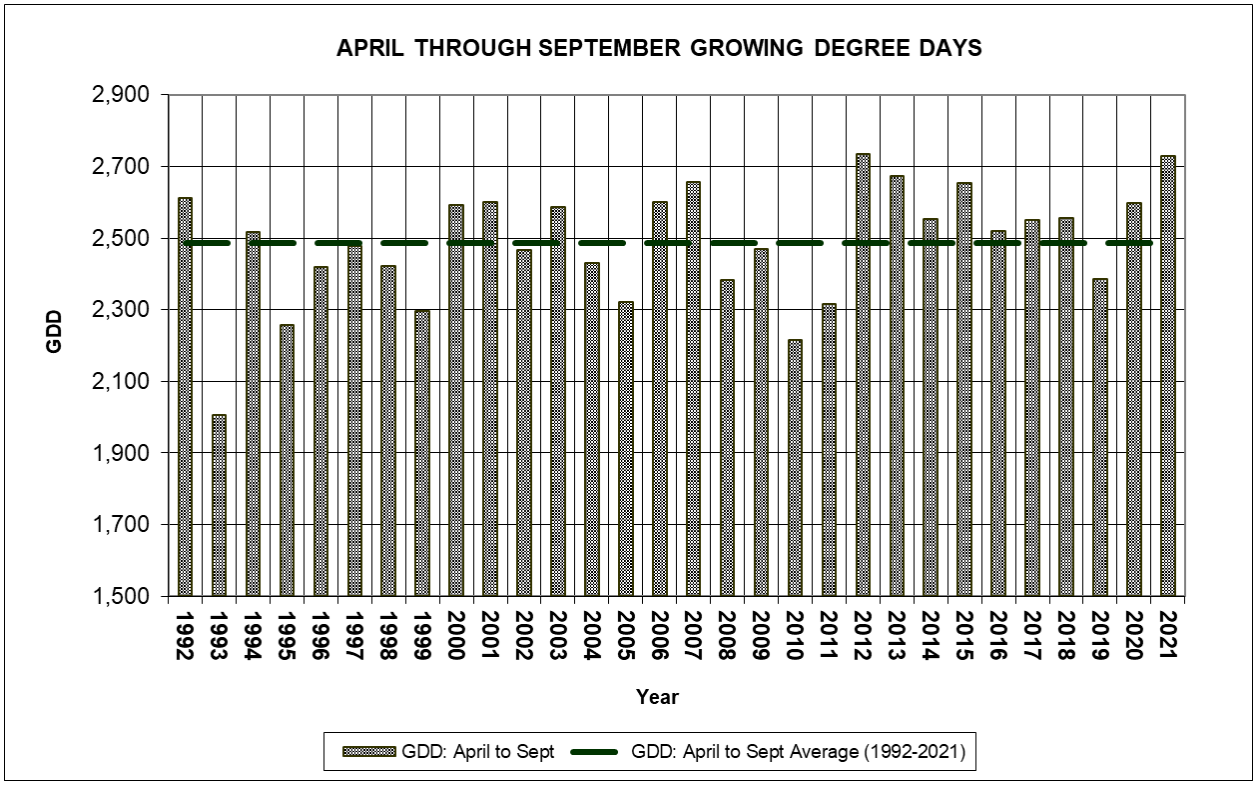
13. Reference ET is a standardized index that approximates the climatic demand for water vapor (i.e. ET). Both ETIdaho and AgriMet calculate and publish reference ET data. The Department will identify potential BLYs by consulting both ETIdaho reference ET and AgriMet reference ET.

14. Neither ETIdaho reference ET data nor AgriMet reference ET data span the entire period of analysis (1992-2021). ETIdaho reference ET data are currently available from 1990 through 2016.[4] AgriMet reference ET data are available from 2000 to 2021.[5] Ideal BLY candidates are years in which reference ET exceeds average reference ET values. The individual year is compared using both AgriMet and ETIdaho reference ET data for those years in which both data are available and only AgriMet data in those years where there is no ETIdaho data.

[4] The Fourth Methodology Order included ETIdaho reference ET data for the period 1991 to 2011. ETIdaho reference ET data is now available through 2016. This Fifth Methodology Order updates this chart with data for the period 1992 to 2016.

[5] The Fourth Methodology Order included AgriMet reference ET data for the period 2000 to 2014. . AgriMet reference ET data is now available through 2021. This Fifth Methodology Order updates this chart with data for the period 2000 to 2021.

15. Years of above average values of reference ET are appropriate BLY candidates.[6] Total April through October reference ET for the period of record from the Twin Falls (Kimberly) AgriMet site is shown below.

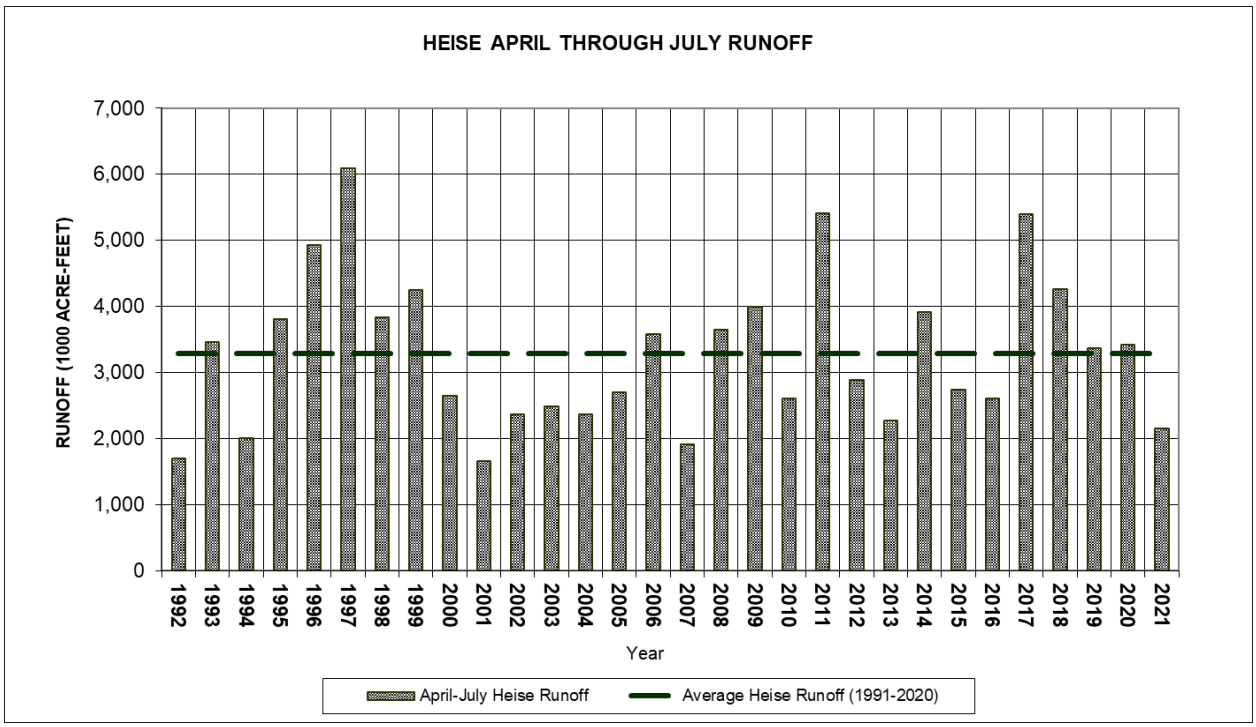


Reference ET for Twin Falls (Kimberly) with both AgriMet and ETIdaho data 1992-2021.[7]

[6] Values for reference ET between ETIdaho and AgriMet do not match because they are derived differently. The relevant information for identifying a potential BLY is the relationship between the year under consideration and the average for the data sets.

[7] The Fourth Methodology Order included data only through 2014. This Fifth Methodology Order updates this chart with combined data for the period 1992 to 2021, establishing a 30-year record which is the professional standard of practice for calculating climatic and hydrologic normals.

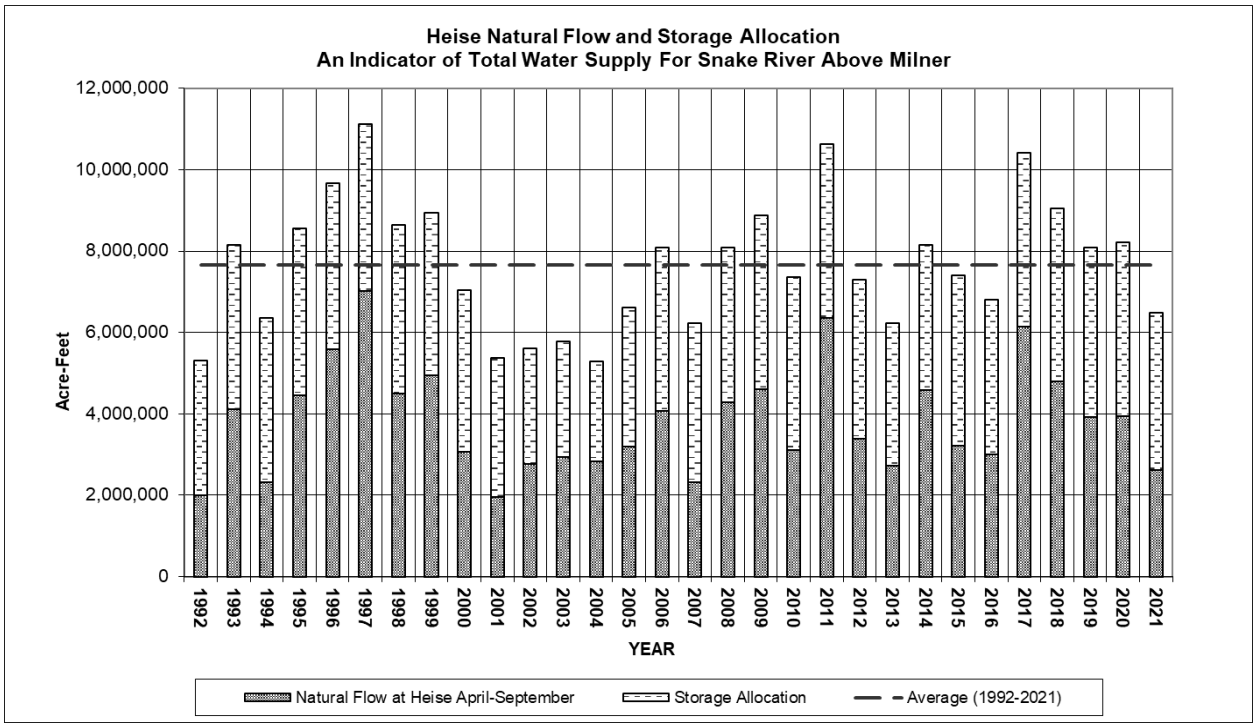
16. Growing Degree Days. Growing degree days define the length and type of growing season. Growing degree days are an arithmetic accumulation of daily mean temperature above a certain base temperature. Ex. 3024 at 10; 117-21. These growth units are a simple method of relating plant growth and development to air temperatures. Different plant species have different base temperatures below which they do not grow. At temperatures above this base, the amount of plant growth is approximately proportional to the amount of heat or temperature accumulated. A higher annual growing degree day value correlates to a higher potential rate of plant growth. The table below shows growing degree days accumulated for April through September for the Twin Falls (Kimberly) AgriMet site.



Growing Degree Days ("GDD") for Twin Falls (Kimberly) AgriMet Site 1992-2021.[8]

[8] The Fourth Methodology Order included data only through 2014. This Fifth Methodology Order updates this chart with data for the period 1992 to 2021.

ii. Available Water Supply



17. The April through July Heise runoff volume represents the volume of water available for diversion into storage reservoirs and is an indicator of natural flow supplies. The graph below shows actual unregulated flow volumes at Heise for 1992 through 2021. The 1992 to 2021 average (3,284,000 acre-feet) is displayed by the dashed line.

April through July Unregulated Flow Volume at Heise, 1992-2021.[9]

[9] The Fourth Methodology Order included data only through 2014. This Fifth Methodology Order updates this chart with data for the period 1992 to 2021.

18. The sum of the Heise natural flow and the reservoir storage allocations is an indicator of the total supply of the Snake River. The sum of the Heise natural flow and reservoir storage allocations for each year from 1992-2021 is represented in the graph below.

The sum of the Heise natural flow and the storage allocation for the Snake River above Milner 1992-2021.[10]

iii. Irrigation Practices

19. A baseline year ("BLY") must be recent enough to represent current irrigation practices. R. Vol. 37 at 7099-7100. Current conditions should be represented by: (a) the net area of the irrigated crops, (b) farm application methods (flood/furrow or sprinkler irrigation), and (c) the conveyance system from the river to the farm. The type of sprinkler systems should be similar between the BLY and the current year.

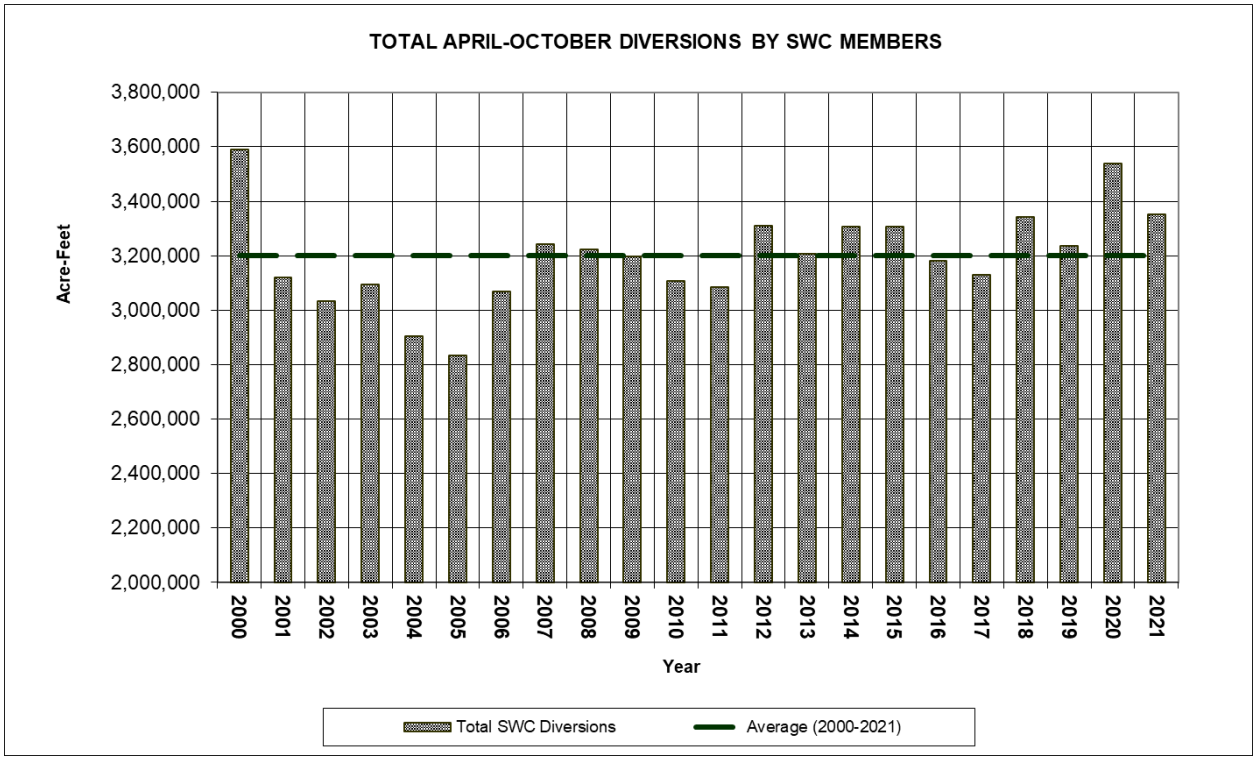
20. Sprinkler systems are currently the predominant application system. *Id*. at 7101-02. To ensure that current irrigation practices are captured, selection of a BLY for the SWC should be limited to years subsequent to 1999. *Id*. at 7096; 7099-7100.

[10] The Fourth Methodology Order included data for the period 1990 to 2014. This Fifth Methodology Order updates this chart with data for the period 1992 to 2021.

21. Estimates of irrigated acres from the hearing show a trend of decreasing irrigated acreage. R. Vol. 28, 5205-15; R. Vol. 37 at 7100. According to the Hearing Officer, beneficial use cannot occur on acres that have been hardened or are otherwise not irrigated. R. Vol. 37 at 7100.

22. The following table summarizes: a) SWC entities; b) shapefile source of reported irrigated acres; c) year shapefile created; d) decreed irrigated acres; (e) number of reported acres in shapefile; and f) irrigated acres used in this methodology order for the 2023 irrigation season. The number of irrigated acres used in this methodology order is the number of reported acres unless that number is larger than the decreed irrigated acres, and if so, then the decreed acres were used. This table will be updated annually based on the reported number of irrigated acres by each SWC entity in Step 1 of the Methodology Order.

Entity	Shapefile Source	Shapefile Year	Partial Decree Acres	Shapefile Acres	Acres Used in Methodology
A&B	PPU[1]	2010	15,924	21,972	15,924
AFRD2	PPU	2010	62,361	69,077	62,361
BID	SWC	2013	47,643	46,035	46,035
Milner	PPU	2010	13,335	13,264	13,264
Minidoka	SWC	2023	75,093	77,176	75,093
NSCC	PPU	2010	154,067	224,463	154,067
TFCC	SWC	2013	196,162	194,732	194,732



[1] IDWR permissible place of use.

Acres used in the methodology.

23. There are lands within the service areas of SWC entities that are irrigated with supplemental groundwater. Exhibit 3007. Supplemental groundwater is a factor the Director can consider in the context of a delivery call. *Memorandum Decision and Order on Petitions for Judicial Review* ("Methodology Remand Order*"*) in Gooding County Consolidated Case No. CV-2010-382, at 18-19. At this time, the information submitted or available to the Department is insufficient to determine the extent of supplemental irrigation on lands within the service areas of SWC entities.

iv. Diversions

24. The following figure summarizes the annual measured diversions by the combined SWC members from 2000-2021. Diversions for a baseline year should exceed the average diversions.

Total April-October Diversions by SWC Members.[11]

B. Selection of the Initial Baseline Year

25. When selecting the BLY the Director must evaluate recent data to determine whether the BLY section criteria are satisfied.

26. In the Fourth Methodology Order, the Department considered the years 2000-2014 when deciding the BLY. Ultimately, the Department chose an average of the years 2006, 2008, and 2012 for the BLY ("BLY 06/08/12"). For this Fifth Methodology Order, the years 2000-2021 were considered for the BLY selection. With the addition of new data from 2014 to 2021, the total diversions by the SWC for the previous BLY 06/08/12 are 100% of the average SWC diversions for the years 2000-2021. As a result of adding the new data, BLY 06/08/12 no longer satisfies the presumption criteria that total diversions in the BLY should exceed the average annual diversions. Mem. Decision & Order on Pets. for Jud. Rev., at 34, *IGWA v. Idaho Dep't of Water Res.*, No. CV-2010-382 (Gooding Cnty. Dist. Ct. Idaho Sept. 26, 2014).

[11] The Fourth Methodology Order did not include this chart. It was added to demonstrate that the baseline year is a year of above average total diversions.

27. Years 2018 and 2020 satisfy all the BLY selection criteria discussed above. Each of these years had (1) total diversions above the average diversions for the years 2000-2021, (2) total growing degree days above the average for the years 1992-2021, and (3) reference ET values above the average for the years 1992-2021. The years 2018 and 2020 also had total precipitation values below the average precipitation for the years 1992-2021 and were not water supply limited years. The Department has reviewed the SWC's diversion data for the 2020 irrigation season. The Department finds that 2020 ranks as the second-highest year of total diversions for the SWC and is more than one standard deviation above the average for the years 2000-2021. In comparison, 2018 ranks as the fourth-highest year of total diversions for the SWC and is less than one standard deviation above the average for the years 2000-2021. Choosing a BLY with above average diversions but within one standard deviation, ensures that a conservative year is selected that protects the senior while excluding extreme years from consideration. The Director concludes that total diversions for 2018 adequately protect senior water rights when predicting the demand shortfall at the start of the irrigation season and selects 2018 as the BLY.

Entity	2000-2021 Avg. Total Diversions (Acre-Feet)	06/08/12 Avg. Total Diversions (Acre-Feet)	06/08/12 % of Avg.	2018 Total Diversions (Acre-Feet)	2018 % of Avg.
A&B	59,474	59,993	101%	64,192	108%
AFRD2	427,978	427,672	100%	453,890	106%
BID	247,049	251,531	102%	262,211	106%
Milner	53,343	47,135	88%	58,417	110%
Minidoka	354,181	369,492	104%	354,851	100%
NSCC	996,267	978,888	98%	1,026,661	103%
TFCC	1,062,098	1,060,011	100%	1,121,717	106%
Total	3,200,389	3,194,722	100%	3,341,939	104%

Average SWC Diversions (acre-feet) for 2000-2021, 2006/2008/2012 BLY, and 2018 BLY.

C. Calculation of Reasonable In-Season Demand

28. Reasonable in-season demand (RISD) is the projected annual diversion volume for each SWC entity during the year of evaluation that is attributable to the beneficial use of growing crops within the service area of the entity. Given that climate and system operations for the year being evaluated will likely be different from the BLY, the BLY must be adjusted for those differences. As stated by the Hearing Officer, "The concept of a baseline is that it is adjustable as weather conditions or practices change, and that those adjustments will occur in an orderly, understood protocol." R. Vol. 37 at 7098.

i. Project Efficiency

29. Project efficiency ("E_p") is the ratio of total volumetric crop water needs within a SWC entity's boundary and the total volume of water diverted by that entity to satisfy its crop needs. It is the same concept as system efficiency, which was presented at hearing. Ex. 3007 at

28-29. Implicit in this relationship are the components of seepage loss (conveyance loss), on-farm application losses (deep percolation, field runoff), and system operational losses (return flows) for which data is not obtainable by the Department. By utilizing project efficiency and its input parameters of crop water need and total diversions, the influence of the unknown components for which data is not obtainable can be captured and described without quantifying each of the components. Project efficiency is derived by dividing crop water need by total diversions as depicted in the algorithm below:

$$E_p = \frac{CWN}{Q_D}$$

Where:

E_p = project efficiency,
CWN = crop water need, and
Q_D = irrigation entity diversion of water specifically put to beneficial use for the growing of crops within the irrigation entity.

30. Monthly SWC entity diversions ("Q_D") will be obtained from Water District 01's diversion records. Ex. 8000, Vol. II, at 8-4, 8-5. Raw monthly diversion values will then be adjusted to remove any water diversions that can be identified to not directly support the beneficial use of crop development within the irrigation entity. Examples of adjustments include the removal of diversions associated with in-season recharge and diversion of irrigation water on the behalf of another irrigation entity. Adjustments are unique to each SWC member and each irrigation season and will be evaluated each year. Any natural flow or storage water deliveries to entities other than the SWC for purposes unrelated to the original right will not be included as a part of the SWC water supply or carryover volume. Water that is purchased or leased by a SWC member may become part of the shortfall obligation to the extent that member has been found to have been materially injured. *See e.g.* R. Vol. 38 at 7201, n. 11 (Eighth Supplemental Order). Conversely, water supplied to private leases or to the rental pool by a SWC member will be included as a part of the SWC supply for that member because non-inclusion would unjustifiably increase the shortfall obligation.

31. Monthly project efficiencies will be computed for the entire irrigation season. Project efficiency varies from month-to-month during the season and will typically be lower during the beginning and ending of the season. Monthly project efficiencies will be divided into actual monthly crop water need ("CWN") values to determine RISD during the year of evaluation.

32. In the Fourth Methodology Order, project efficiencies for each SWC member were initially averaged over an eight-year period (2007-2014) and project efficiency greater or less than two standard deviations were excluded from the calculation. By including only those values within two standard deviations, extreme values from the data set are removed. Under the Fourth Methodology Order, an updated 8-year rolling average of project efficiencies was calculated each year the methodology was implemented. The Director now finds that averaging over a rolling period of 15 years results in project efficiency values that are more consistent from year-to-year, reducing the impact of short-term trends. The Director finds that it is still

appropriate to remove project efficiencies greater or less than two standard deviations from the average.

The following is a table of efficiency values averaged over the most recent fifteen-year period of record.

Month	A&B	AFRD2	BID	Milner	Minidoka	NSCC	TFCC	Monthly Avg.
4	0.98	0.33	0.45	0.87	0.43	0.24	0.31	0.51
5	0.47	0.22	0.32	0.39	0.35	0.24	0.30	0.33
6	0.66	0.40	0.49	0.60	0.56	0.41	0.51	0.52
7	0.74	0.44	0.52	0.67	0.63	0.48	0.58	0.58
8	0.58	0.41	0.42	0.55	0.52	0.43	0.46	0.48
9	0.45	0.27	0.32	0.45	0.38	0.32	0.27	0.35
10	0.18	0.16	0.09	0.14	0.11	0.06	0.04	0.11
Season Avg.	0.58	0.32	0.37	0.52	0.43	0.31	0.35	

SWC Member Average Monthly Project Efficiencies from 2007-2021.[12]

ii. Crop Water Need

33. CWN is the volume of irrigation water required for crop growth within a SWC entity boundary, such that crop growth is not limited by water availability. CWN only applies to crops irrigated with surface water. CWN is the difference between the fully realizable consumptive use associated with crop growth, or ET, and effective precipitation (W_e) and is synonymous with the terms irrigation water requirement and precipitation deficit. Ex. 3024. For the purposes of the methodology, CWN is calculated as set forth below:

$$CWN = \sum_{i=1}^{n} (ET_i - W_e) A_i$$

Where,

CWN = crop water need
ET_i = consumptive use of specific crop type,
W_e = effective precipitation,
A_i = total irrigated area of specific crop type,
i = index variable representing the different specific crop types grown within the irrigation entity, and
n = upper bound of summation equal to the total number of different specific crop types grown within the irrigation entity.

[12] In the Fourth Methodology Order, this table summarized average E_p data for the period 2007 to 2014. This Fifth Methodology Order updates this table with average E_p data for the period 2007 to 2021.

iii. Evapotranspiration

34. ET can be estimated with theoretically based equations that calculate ET for an individual crop, necessitating crop distribution maps for each year. Ex. 3007A at 21, Figure 3, Tables 6-12; Ex. 3024 at 1-58; Ex. 8000, Vol. II at Chapter 9; Ex. 8000, Vol. IV, Appdx. AU.

35. At hearing, values of ET were estimated by the SWC from AgriMet, Ex. 8000, Vol. IV, Appdx. AU-1, and by the ground water users from ETIdaho, Ex. 3007A at 21; Ex. 3024 at 1-58. At this time, the Director finds that the use of AgriMet is more appropriate for determining ET than ETIdaho because AgriMet is available to all parties in real-time without the need for advanced programming. Accordingly, the methodology will rely on AgriMet derived ET values in the calculations of project efficiency, CWN, and RISD. In the future, with the development of additional enhancements, ETIdaho may become a more appropriate analytical tool for determining ET.[13]

36. CWN is derived by multiplying crop specific ET values, adjusted for estimated effective precipitation, by the total irrigated area of individual crop types, and summing for all crop types. The areas for individual crop types will be derived from published crop distributions from the United States Department of Agriculture's National Agricultural Statistics Service ("NASS"). Ex. 1005 at 1. NASS annually creates a crop-specific land cover digital dataset from satellite imagery and field checks. The dataset is called the Cropland Data Layer ("CDL"). Each year, the Department will calculate acreage by crop type for each SWC entity using NASS CDL data. In the future, the NASS data may not be the most accurate source of data. The Department prefers to rely on data from the current season if and when it becomes usable.

37. AgriMet ET and precipitation data are gathered at the Rupert and Twin Falls (Kimberly) stations. Both stations are in the vicinity of the SWC entities. A&B Irrigation District ("A&B"), Burley Irrigation District ("BID"), and Minidoka Irrigation District ("Minidoka") are nearest to the Rupert AgriMet station. ET data gathered at the Rupert station reasonably represents the climate conditions for A&B, BID, and Minidoka. American Falls Reservoir District No. 2 ("AFRD2"), Milner Irrigation District ("Milner"), North Side Canal Company ("NSCC"), and Twin Falls Canal Company ("TFCC") are nearest to the Twin Falls (Kimberly) AgriMet station. ET data gathered at the Twin Falls (Kimberly) station reasonably represents the climate conditions for AFRD2, Milner, NSCC, and TFCC. Ex. 8000, Vol. IV at AU-2, AU-8.

iv. Effective Precipitation

38. Effective precipitation ("W_e") is the amount of total precipitation held in the soil horizon available for crop root uptake. Effective precipitation will be estimated from total precipitation (W) employing the methodology presented in the USDA Technical Bulletin 1275. Ex. 8000, Vol. IV, Appdx. AU3, AU8. Total precipitation (W) data is published by the USBR as

[13] IDWR held a series of meetings in the winter of 2022-23 with the parties' technical consultants to discuss potential updates to the methodology order. During the meetings, IDWR discussed alternative methods of determining ET values, such as METRIC. However, the Director finds that the methods considered are not yet ready for incorporation into the administration of the SWC Delivery Call and will continue to rely on AgriMet ET data.

part of its Pacific Northwest Cooperative Agricultural Network, i.e. AgriMet.[14] Ex. 8000, Vol. IV, Appdx. AU3. W_e values derived from AgriMet based precipitation values are independent of crop type.

39. AgriMet precipitation (W) values are easy to understand and regularly used by the farming, water supply, and water management communities. Accordingly, the methodology will rely on AgriMet derived W values in the calculations of CWN and RISD.

40. As with ET data, AgriMet precipitation data are available from the Rupert and Twin Falls (Kimberly) stations. AgriMet data from the Rupert station reasonably represents climate conditions for A&B, BID, and Minidoka. AgriMet data from Twin Falls (Kimberly) reasonably represents climate conditions for AFRD2, Milner, NSCC, and TFCC. Ex. 8000, Vol. IV at AU-2, AU-8.

v. Summary of Reasonable In-Season Demand Calculation

41. At the start of the irrigation season, RISD is equal to the BD, or total season adjusted diversions for the BLY. When calculated in-season, RISD is calculated below.

$$RISD_{milestonex_x} = \sum_{j=1}^{m}\left(\frac{CWN_j}{E_{p,j}}\right) + \sum_{j=m+1}^{7} BD_j$$

Where:

$RISD_{milestone_x}$ = reasonable in season demand at specified evaluation milestones during the irrigation season,
CWN = crop water need for month j,
E_p = baseline project efficiency for month j,
BD = baseline demand for month j,
j = index variable, and
m = upper bound of summation, equal to the month calculation occurs, where April = 1, May =2, … October = 7.

42. April RISD Adjustment: In April, the calculated RISD, which is the quotient of CWN and Ep, can underestimate actual canal operation diversions. Under-estimation occurs when the actual CWN value for April is much smaller than the diversion of water into the canal system necessary to effectively operate the irrigation delivery system. Often, CWN in April is small due to precipitation, cool temperatures, and/or the immaturity of the crop. The diversion rate at the head gate necessary to push water into all laterals and field head gates throughout the delivery system often dwarfs the water necessary to strictly satisfy CWN. In addition, it is difficult for canal systems to be dynamically operated to match the frequent precipitation events in April, which also contributes to a diversion of water at the canal head gate that exceeds the diversion of water necessary to strictly satisfy CWN. To account for the conditions affecting the

[14] IDWR held a series of meetings in the winter of 2022-23 with the parties' technical consultants to discuss potential updates to the methodology order. During the meeting, IDWR discussed alternative methods to determine W values, such as PRISM. However, the Director finds that the methods considered are not yet ready for incorporation into the administration of the SWC Delivery Call and will continue to rely on AgriMet precipitation data.

usability of the calculated RISD value for April, the values may be adjusted for each individual irrigation delivery entity in the SWC as described below.

43. When the calculation of CWN/Ep results in a value for the month of April less than the average April diversion volume over a record of representative years in the recent past, the April RISD is set equal to the average April diversion volume. When the calculation of CWN/Ep results in a value greater than the average April diversion volume, the April RISD is equal to the calculated CWN/Ep volume.

44. October RISD Adjustment: In October, the calculated RISD, which is equal to the CWN divided by Ep, can both under-estimate and over-estimate actual canal operation diversions. The RISD may be underestimated when the actual CWN value for October is much smaller than the diversion of water into the canal system necessary to effectively operate the irrigation delivery system. The diversion rate at the head gate necessary to push water into all laterals and field head gates throughout the delivery system often dwarfs the water necessary to strictly satisfy CWN. In addition, it is difficult for canal systems to be dynamically operated to match the frequent precipitation events in October, which also contributes to a diversion of water at the canal head gate that exceeds the diversion of water necessary to strictly satisfy CWN. Furthermore, RISD may be underestimated in October when a farmer diverts water at the field head gate for farming practices other than strictly satisfying CWN. Examples of water diversion practices at the field head gate that sometimes occur in October include diverting water for soil salt leaching, diverting water to build up the soil moisture profile for the following irrigation season, and/or diverting water to wet-up bare soil to prevent wind-driven topsoil erosion.

45. Unlike the month of April, RISD can be over-estimated in October. RISD may be over-estimated in years when actual CWN in October is much greater than typical CWN over a record of representative years in the recent past due to low precipitation and/or warm temperatures. To account for the conditions affecting the usability of the RISD value calculated for October, the values may be adjusted for each individual irrigation delivery entity in the SWC as described below.

46. When the calculation of CWN/Ep results in a value for the month of October greater than the maximum October diversion volume from a record of recent representative years, or less than the minimum October diversion volume from the same record of recent representative years, the October RISD is set equal to the average October diversion volume over the same period of recent representative years. When the calculation of CWN/Ep results in a value between the maximum and minimum October diversion volumes from a record of recent representative years, the October RISD is equal to the calculated CWN/Ep volume.

D. Adjustment of Forecast Supply

47. As stated by the Hearing Officer, "There must be adjustments as conditions develop if any baseline supply concept is to be used." R. Vol. 37 at 7093. A prediction of the upcoming season's supply and demand is calculated at the beginning of the irrigation season and

adjusted at specified milestones during the irrigation season to address changes in water supply and demand conditions in response to actual climatic and water supply conditions.

i. April Forecast Supply

48. The FS is comprised of natural flow and stored water.

49. Typically, within the first week of April, the USBR and the USACE issue their Joint Forecast that predicts an unregulated inflow volume at the Heise Gage from April 1 to July 31 for the forthcoming year. The joint forecast ("Joint Forecast") issued by the United States Bureau of Reclamation ("USBR") and the United States Army Corp of Engineers ("USACE") for the period April 1 through July 31 "is generally as accurate a forecast as is possible using current data gathering and forecasting techniques." R. Vol. 8 at 1379, ¶ 98. Given current forecasting techniques, the earliest the Director can predict material injury "with reasonable certainty" is soon after the Joint Forecast is issued. R. Vol. 2 at 226. With data from 1990 through the irrigation year previous to the current year, a regression equation will be developed for each SWC member.[15] The regression equations for A&B and Milner will be developed by comparing the actual Heise natural flow to the natural flow diverted. *See e.g.* R. Vol. 8 at 1416-22. For AFRD2, BID, Minidoka, NSCC, and TFCC, multi-linear regression equations will be developed by comparing the actual Snake River near Heise natural flow and the flows at Box Canyon to the natural flow diverted. The regression equations will be used to predict the natural flow diverted for the upcoming irrigation season. *Id*. at 1380. The actual natural flow volume predicted in the Director's April FS for each SWC entity will be one standard error below the regression line, which underestimates the available supply. *Id*.; Tr. p. 65, lns. 6-25; p. 66, lns. 1-2. The purpose of the shift to one standard error below the regression line is to ensure senior water right holders do not bear the risk of under-prediction of supply. The forecasting techniques will be revised based on updated data and the forecasting techniques may be revised when improvements to the forecasting tools occur.

50. The storage allocation for each member of the SWC will be estimated by the Department following issuance of the Joint Forecast. The Department will forecast reservoir fill and storage allocation consistent with the methods established in the *Fifth Supplemental Order Amending Replacement Water Requirements Final 2006 & Estimated 2007.* R. Vol. 23 at 4294-97 as explained below. The Department will evaluate the current reservoir conditions and the current water supply outlook to determine a historical analogous year or years to predict reservoir fill. The Department may identify and use a combination of different analogous years to predict individual reservoir fill. Input variables for determining the individual storage water allocation for each SWC member are: (a) the analogous year's or years' total reservoir fill volume; (b) an estimated evaporation volume; and (c) the previous year's carryover volume. The FS (the combination of the forecast of natural flow supply and the storage allocation) for each SWC member will be determined by the Director shortly after the date of the Joint Forecast.

[15] IDWR held a series of meetings in the winter of 2022-23 with the parties' technical consultants to discuss potential updates to the methodology order. During the meetings, IDWR discussed updating the regression models used to forecast the SWC's water supplies in April. However, the Director finds that the current models still adequately forecast water supplies in April and will continue to rely on the existing regression models.

51. Any time prior to the Director's final determination of the April FS, if the Director can determine with certainty that any member of the SWC has diverted more natural flow than predicted, or has accrued more storage than predicted, the Director will revise his initial, projected shortfall determination.

ii. July Forecast Supply

52. Approximately halfway through the irrigation season, the FS will be adjusted. When adjusting the natural flow component of the FS, the Department's water rights accounting program will compute the year-to-date natural flow diverted by each member of the SWC. The natural flow diversion for the remainder of the irrigation season will be estimated based on the regression analyses.

53. The natural flow supplies for each SWC member are comprised of natural flow in the Snake River passing the near Blackfoot gage and gains that occur in the Snake River between the Blackfoot to Milner reach. Many different predictor variables were considered when developing the models used to predict the natural flow supplies for the remainder of the season, including those variables used in the April FS.[16] A step-wise statistical analysis was employed to help select the variables for each model. The following variables were selected to forecast water supplies halfway through the irrigation season: natural flow in the Snake River near Heise as reported by the U.S. Bureau of Reclamation; snow water equivalent (SWE) data at the Two Ocean Plateau SNOTEL site; Spring Creek discharge; and groundwater levels near American Falls Reservoir. The model predictors were optimized for each SWC member and are summarized in the sections below.

54. Linear regression equations for AFRD2, A&B, and Milner, will be developed by comparing the July 1 snow water equivalent (inches) at the Two Ocean Plateau SNOTEL site to the natural flow diversions. The regression equations for AFRD2, A&B, and Milner will be applied only in those years when the snow water equivalent at the Two Ocean Plateau SNOTEL site is greater than zero (0). Years when the snow water equivalent equals zero, the total natural flow prediction for the period July 1 to October 31 will be zero (0) AF.

55. Multiple linear regression equations for BID, Minidoka, and NSCC will be developed to predict natural flow diversions employing the following predictor variables: (1) Snake River near Heise natural flow (April – June), (2) March depth to water at well 05S 31E 27ABA1 and (3) the snow water equivalent at the Two Ocean Plateau SNOTEL site on June 15.

56. The multiple linear regression model for TFCC will be based on the following predictor variables: (1) Snake River near Heise natural flow (April – June), (2) Spring Creek total discharge (January – May) and (3) the snow water equivalent at the Two Ocean Plateau SNOTEL site on June 15.

[16] IDWR held a series of meetings in the winter of 2022-23 with the parties' technical consultants to discuss potential updates to the methodology order. IDWR discussed updating the regression models used to forecast the SWC's water supplies in July. However, the Director finds that the current models still adequately forecast water supplies in July and will continue to rely on the existing regression models.

57. When adjusting the storage component of the FS, the Department must consider whether stored water has been allocated. In normal to dry years, the reservoirs will typically have filled to their peak capacity for the season and the storage water will have been allocated. If the BOR and Water District 01 have allocated stored water to spaceholders, the Department will use the actual preliminary storage allocations to the SWC. If the BOR and Water District 01 have not yet allocated stored water to spaceholders, the Department will predict the storage allocations based on the storage allocations from an analogous year or years.

iii. Time of Need

58. The FS will again be adjusted shortly before the Time of Need. The Time of Need is established by predicting the day in which the remaining storage allocation will be equal to reasonable carryover. The Time of Need will not be earlier than the Day of Allocation.

59. When adjusting the natural flow component of the FS, the Department's water rights accounting program will compute the natural flow diverted by each member of the SWC as of the new forecast date. The natural flow diversion for the remainder of the irrigation season will be estimated based on a historical year with similar reach gains in the Blackfoot to Milner reach. The following is an example of estimating reach gains from an analysis of historical years. Reach gains for the years 2000 – 2003 and a portion of year 2004 are graphed below. Considering 2004 as an example of a current year and comparing 2004 to the hydrographs for 2000 – 2003, year 2003 has similar reach gains and is appropriately conservative. Therefore, the natural flow diverted in 2003 would be used to predict the natural flow diversions for the remainder of the 2004 season.

Example Reach Gain Analysis for 2004.

60. When adjusting the storage component of the FS, the Department will use the actual preliminary storage allocations to the SWC.

61. The adjusted FS is the sum of the year-to-date natural flow diversions, the predicted natural flow diversions for the remainder of the season, and the storage allocation.

E. Calculation of In-Season Demand Shortfall

62. The equation below determines the amount of predicted demand shortfall during the irrigation season.

$$IDS = FS - RISD$$

Where:

IDS = demand shortfall for specified evaluation points throughout the season,
FS = forecasted supply adjusted for specified evaluation point during the season, and
RISD = reasonable in-season demand from above.

63. The amount calculated represents the volume that junior ground water users with approved mitigation plans for delivery of water will be required to have available for delivery to members of the SWC found to be materially injured by the Director to avoid curtailment. The amounts will be calculated in April, at the middle of the season, and at the Time of Need.

III. Methodology for Determining Material Injury to Reasonable Carryover

64. Conjunctive Management ("CM") Rule 42.01.g states the following guidance for determining reasonable carryover: "In determining a reasonable amount of carry-over storage water, the Director shall consider average annual rate of fill of storage reservoirs and the average annual carry-over for prior comparable water conditions and the projected water supply for the system." Carryover shortfall will be determined following the completion of the irrigation season.

A. Projected Water Supply

65. CM Rule 42.01.g states that the Director "shall consider . . . the projected water supply for the system." Because it is not possible to adequately forecast the irrigation supply or demand for the following irrigation season at the end of the current irrigation season, the Director must estimate the carryover water needed in future dry years when demand exceeds supply, creating a need for carryover storage. The Director projected the water supply using typical dry years and subtracted it from a projected future demand to determine a projected carryover need.

66. The Heise natural flow is a predictive indicator of total water supply. For the years 2002 and 2004, the Heise natural flows were well below the long term average (1992-2021), but were not the lowest years on record.[17] The average of the 2002 and 2004 supply will be the projected supply, representing a typical dry year. The 2002 and 2004 supply is computed as follows:

- 2002 supply = natural flow diverted + new storage fill
- 2004 supply = natural flow diverted + new storage fill
- Projected supply = average of 2002 supply and 2004 supply

Carryover from previous years is not included in the 2002 and 2004 new storage fill because it was not new water supplied during the 2002 or 2004 irrigation year.

	2002 Natural Flow Diverted	2002 New Storage Fill	2002 Total Supply	2004 Natural Flow Diverted	2004 New Storage Fill	2004 Total Supply	Projected Supply (Average 02/04)
	----------Acre-Feet----------						
A&B	853	45,603	46,456	1	36,535	36,536	41,496
AFRD2	25,749	381,451	407,200	4,562	309,698	314,260	360,730
BID	89,886	174,454	264,340	102,706	152,387	255,093	259,716
Milner	5,058	43,430	48,488	1,027	35,175	36,202	42,345
Minidoka	143,937	256,602	400,539	141,460	229,574	371,034	385,787
NSCC	363,960	667,799	1,031,759	315,942	479,068	795,010	913,385
TFCC	851,970	186,233	1,038,203	881,345	150,218	1,031,563	1,034,883

SWC water supplies 2002, 2004, and 2002/2004 average (acre-feet).

67. Similar to projecting supply, the Director must also project demand. Because it is not possible to adequately forecast the irrigation demand for the following irrigation season at the end of the current irrigation season, the Director must project demand. R. Vol. 37 at 7109. The 2018 BLY will be the projected demand.

[17] The Fourth Methodology Order included data for the period 1991 to 2014. This Fifth Methodology Order updates this chart with data for the period 1992 to 2021.

68. The maximum projected carryover need is defined as the difference between a BLY demand and projected typical dry year supply. The following equation computes the maximum projected carryover need:

Maximum Projected Carryover Need = Projected Demand (2018 BLY) – Projected Supply (Average 02/04)

	Projected Demand (2018 BLY)	Projected Supply (average 02/04)	Maximum Projected Carryover Need
	----------Acre-Feet----------		
A&B	64,192	41,496	22,696
AFRD2	453,890	360,730	93,160
BID	262,211	259,716	2,495
Milner	58,417	42,345	16,072
Minidoka	354,851	385,787	0
NSCC	1,026,661	913,385	113,277
TFCC	1,121,717	1,034,883	86,834

SWC Projected Demand, Projected Supply and Maximum Projected Carryover Need (acre-feet).[18]

B. Average Annual Rate of Fill

69. CM Rule 42.01.g states that the Director "shall consider the average annual rate of fill of storage reservoirs . . . ." The average annual rate of fill of the storage reservoirs is the average of annual percentages of fill of each entity's reservoir space. The average annual reservoir storage fill is a benchmark that can be compared to projected carryover need. For purposes of the table below, any water contributed to the rental pool from the previous year was added to the next year's fill volume so that it does not artificially lower the percent fill. R. Vol. 37 at 7108. Water that is supplied to the rental pool lowers carryover and could impact the following year's fill. The percent fill does not include water deducted for reservoir evaporation.

[18] This Fifth Methodology Order updates this chart with the new baseline year and calculates new maximum projected carryover need values.

The annual percent fill of storage volume by SWC entity is shown below:

Year	A&B	AFRD2	BID	Milner	Minidoka	NSCC	TFCC
1992	96%	100%	98%	93%	75%	76%	86%
1993	100%	100%	100%	100%	100%	93%	92%

Annual Percent Fill of Storage Volume by Entity (1992-2021).[19]

[19] The Fourth Methodology Order included data from 1995 through 2014. This Fifth Methodology Order updates this chart with data from 1992 through 2021.

C. Average Annual Carryover

70. CM Rule 42.01.g states that the Director "shall consider the . . . average annual carry-over for prior comparable water conditions . . .." Actual carryover volumes are from annual storage reports published by Water District 1. Actual carryover from 1992 through 2021 are sorted into two categories – below average (dry) and above average (wet). The categories are based on Heise natural flow volumes from April through September.

The 1992 to 2021 average natural flow volume is 3,827 thousand acre-feet ("KAF").

Cat.	Year	Heise Apr–Sept (KAF)	A&B	AFRD2	BID	Milner	MID	NSCC	TFCC
			----------	----------	----------	Acre-Feet	----------	----------	----------
	2001	1,968	9,902	4,217	37,430	26,854	55,132	42,421	26,917
	1992	2,001	11,966	11,548	31,977	28,896	16,928	19,439	3,590
	1994	2,319	82,885	26,894	54,136	45,902	102,823	128,356	38,686
	2007	2,320	62,739	7,962	32,138	37,761	61,744	66,807	39,999
	2021	2,622	73,688	988	61,327	27,448	65,393	121,946	13,581

Actual Carryover Volumes by Entity, Sorted by Heise Natural Flow (1992-2021).[20]

[20] In the Fourth Methodology Order, this table summarized data for the period 1994 to 2014 and adjusted WD 01 carryover values to remove water received for mitigation or water rented by the SWC entity to augment their supplies. This Fifth Methodology Order updates this chart with data for the period 1992 to 2021 and uses raw

71. In considering the principles articulated in CM Rule 42.01.g, the Director will project reasonable carryover shortfalls for members of the SWC. The following table represents the 2018 BLY diversion volumes and total reservoir storage space by entity. By dividing the total reservoir space by the 2018 diversion volume, a metric is established that describes the total number of seasons the entity's reservoir space can supply water.

	A&B	AFRD2	BID	Milner	Minidoka	NSCC	TFCC
	----------Acre-Feet----------						
Projected Demand (2018 BLY)	64,192	453,890	262,211	58,417	354,851	1,026,661	1,121,717
Total Reservoir Space	137,626	393,550	226,487	90,591	366,554	859,898	245,930
Number of Seasons of Reservoir Space	2.1	0.9	0.9	1.6	1.0	0.8	0.2

Total Reservoir Space[21] in Comparison to Demand.[22]

D. Reasonable Carryover

i. A&B

72. A&B's reservoir space has the lowest average annual rate of fill with the highest variability in fill. *See* Finding of Fact 69. In dry years, the potential exists that A&B's actual carryover will be less than the maximum projected carryover need. *See* Finding of Fact 68 & 70. A&B has an approximate two-year water supply provided by its total available storage space. *See* Finding of Fact 71. Because of its lower rate of fill, it is likely A&B will experience carryover shortfalls in consecutive dry years. Based on the evaluation criteria in CM Rule 42.01.g, A&B's reasonable carryover should be the maximum projected carryover need of 22,700 AF. *See* Finding of Fact 78.

ii. AFRD2

73. AFRD2 has the highest and most consistent reservoir rate of fill of any member of the SWC. AFRD2's storage space fills 99% of the time and has a fill variability of 3%. As

carryover values reported by WD 01. Raw numbers were used because adjusted numbers reduced the SWC's potential entitlement to reasonable carryover.

[21] *See* R. Vol. 8 at 1373-74.

[22] This Fifth Methodology Order updates this chart with the new baseline year and calculates new number of seasons of reservoir space values.

shown in the Annual Percent Fill table in Finding of Fact 69 above, its space only failed to fill in 2004 (82%) and 2000 (99%). AFRD2 has a high likelihood of filling during multi-year droughts and after a dry year. *See* Finding of Fact 69. Therefore, any unfilled space in the fall will most likely fill. AFRD2 has an approximate one-year supply available in storage. *See* Finding of Fact 71. AFRD2's storage space only failed to fill in years when the natural flow volume at Heise was less than 3,100 KAF. In a dry year, AFRD2's historical carryover volume is often less than the maximum projected carryover need using the equation set forth in Finding of Fact 68 and 70. Based on the evaluation criteria for reasonable carryover in CM Rule 42.01.g, the reasonable carryover can be adjusted from the maximum projected carryover need without shifting the risk of shortage to the senior right holder. The historical average carryover of 16,700 AF in years when the natural flow volume at Heise was less than 3,100 KAF is the reasonable carryover for AFRD2. *See* Finding of Fact 78.

iii. BID & Minidoka

74. Historically, in dry years, BID's and Minidoka's carryover volumes have been well above the maximum projected carryover need and it is unlikely that they will have reasonable carryover shortfalls in the future. *See* Finding of Fact 68 & 70; *see also* R. Vol. 37 at 7105. Based on the evaluation criteria for reasonable carryover in CM Rule 42.01.g, the reasonable carryover can be adjusted downward from the maximum projected carryover need without shifting the risk of shortage to the senior right holder. The reasonable carryover for BID and Minidoka is 0 AF. *See* Finding of Fact 78; *see also* R. Vol. 37 at 7105.

iv. Milner

75. Similar to A&B, Milner's reservoir space has the second lowest average annual rate of fill of all entities and has a high degree of variability in fill. *See* Finding of Fact 69. In dry years, the potential exists that Milner's actual carryover will be less than the maximum projected carryover need. *See* Finding of Fact 68 & 70. Milner has an approximate one and one half water supply available in storage. *See* Finding of Fact 71. Because of its rate of fill, it is likely Milner will experience carryover shortfalls in consecutive dry years. Based on the evaluation criteria for reasonable carryover in CM Rule 42.01.g, the maximum projected carryover need of 16,100 AF is the reasonable carryover for Milner. *See* Finding of Fact 78.

v. NSCC

76. NSCC has a near-average annual rate of fill in comparison to all entities and an approximate one-year water supply available in storage. *See* Findings of Fact 69 & 71. In dry years, the potential exists that its maximum projected carryover need will be less than its actual carryover. *See* Finding of Fact 68 & 70. Based on the evaluation criteria in CM Rule 42.01.g, the reasonable carryover for NSCC is 113,300 AF. *See* Finding of Fact 77.

vi. TFCC

77. TFCC has a near average annual rate of fill in comparison to all entities, but only 20% of a single year's water supply is available in storage. TFCC's storage space fills 97% of

the time and has a fill variability of 8%. *See* Findings of Fact 69 & 71. In dry years, the potential exists that its maximum projected carryover need will be less than its actual carryover. *See* Finding of Fact 68 & 70. Based on the evaluation of the criteria in CM Rule 42.01.g, the reasonable carryover can be adjusted from the maximum projected carryover need without shifting the risk of shortage to the senior right holder. The historical average carryover in dry years of 37,400 AF is the reasonable carryover for TFCC. *See* Finding of Fact 78.

78. Reasonable carryover values for the SWC members are as follows:

	Reasonable Carryover (Acre-Feet)
A&B	22,700
AFRD2	16,700
BID	0
Milner	16,100
Minidoka	0
NSCC	113,300
TFCC	37,400

E. Reasonable Carryover Shortfall

79. Reasonable carryover shortfall is the numerical difference between reasonable carryover and actual carryover, calculated at the conclusion of the irrigation season. Actual carryover is defined as the storage allocation minus the total storage use plus or minus any adjustments. Examples of adjustments include SWC water placed in the rental pool and SWC private leases. Adjustments are unique to each irrigation season and will be evaluated each year. Any storage water deliveries to entities other than the SWC for purposes unrelated to the original right will be adjusted so that the water is not included as a part of the SWC carryover volume. Water that is purchased or leased by an SWC member may become part of the carryover shortfall obligation. *See e.g.* R. Vol. 38 at 7201, n. 11 (Eighth Supplemental Order). Conversely, actual carryover must be adjusted to assure that water supplied by a SWC member to private leases or to the rental pool will not increase the reasonable carryover shortfall obligation to the same SWC member.

80. Reasonable carryover shortfall is calculated as follows:

Reasonable Carryover Shortfall = Actual Carryover – Reasonable Carryover

F. Determination of Curtailment Date

81. The Eastern Snake Plain Aquifer Model ("ESPAM") is the best scientific tool available to simulate aquifer and Snake River responses to stresses applied to the aquifer, such as ground water pumping from a well. Curtailment of junior ground water pumpers in response to the SWC Delivery Call would result in a reduction in the withdrawal of groundwater and a corresponding reduction in aquifer stress. ESPAM simulates the effects of the reduction in

aquifer stress and calculates predicted increases in aquifer discharge to the Snake River resulting from the curtailment of ground water pumping from the ESPA.

82. ESPAM simulations can be either steady-state or transient.

83. Merriam-Webster's Dictionary defines steady-state as "a state or condition of a system or process … that does not change in time." *Steady state*, Merriam-Webster.com, https://www.merriam-webster.com/dictionary/steady-state (April 19, 2023). A steady-state ESPAM simulation can only model increases in aquifer discharge to the Snake River resulting from continuous curtailments of an identical magnitude and location until the impacts of curtailment are fully realized. For example, a steady-state analysis of the curtailment of 1,000 acres, assumes that irrigation of the same 1,000 acres is curtailed every year at the same rate of consumptive use, until the impacts of that curtailment reach a steady state, or no longer change from year to year.

84. Steady-state analysis does not calculate the time to reach steady-state conditions nor describe the seasonal timing of the impacts. For the benefits of curtailment predicted by steady-state analysis to be realized by the river, the curtailment must occur continuously until steady-state is achieved. The assumption of continuous curtailment does not reflect reality in the SWC Delivery Call. Curtailments ordered as prescribed in the methodology are neither continuous nor long-term. Irrigation with ground water does not occur at a constant rate throughout the year nor from year to year. It is important to predict what benefits to the river are realized during the irrigation season in which injury has been determined. A steady-state ESPAM simulation cannot predict what benefits are realized during the irrigation season. In contrast, a transient ESPAM simulation will predict the timing of changes in river reach gains.

85. ESPAM was calibrated using one-month stress periods and can simulate a single (or partial) irrigation season of curtailment and predict the resulting increase in aquifer discharge to the Snake River during the same irrigation season using a transient simulation. In the context of this proceeding, the transient approach identifies the junior ground water rights that must be curtailed to produce increases in Snake River flows sufficient to offset material injury in the current irrigation season.

86. Only 9% to 15% of the steady state response is predicted to accrue to the near Blackfoot to Minidoka reach between May 1 and September 30 of the same year.[23] Fifty percent of the steady-state response is predicted to accrue at the near Blackfoot to Minidoka reach within approximately four years. Ninety percent of the steady-state response is predicted to accrue at the near Blackfoot to Minidoka reach within approximately 24 years.

87. A curtailment to a priority date calculated by the steady state analysis method used in the Fourth Methodology Order will only offset 9% to 15% of the predicted IDS. In contrast, curtailment to a priority date calculated with a transient simulation of a single season curtailment will offset the full predicted IDS unless the shortfall exceeds the accruals to the near

[23] The near Blackfoot to Minidoka reach is the reach of the Snake River from which the SWC diverts.

Blackfoot to Minidoka reach by the end of the irrigation season with curtailment of all junior ground water rights.

88. Steady-state simulations are appropriate for evaluating the average annual impact of aquifer stresses that have been, or will be, applied for decades (i.e., ground water pumping year after year, or continuous curtailment to the same date every year). The steady-state simulation of continuous curtailment applied in the Fourth Amended Methodology Order does not simulate the short-term curtailments prescribed in the methodology. The methodology prescribes curtailment only in years with a predicted IDS or carryover shortfall and prescribes the determination of a curtailment priority date that varies with the magnitude of the predicted shortfall.

89. Transient simulations are necessary to evaluate the impacts of aquifer stresses applied for short periods of time (i.e. short-term curtailments with varying priority dates). Transient simulations are necessary to simulate the short-term curtailments prescribed in the methodology.

CONCLUSIONS OF LAW

1. This order contains the methodology by which the Director will determine material injury to RISD and reasonable carryover to members of the SWC.

2. "The agency's experience, technical competence, and specialized knowledge may be utilized in the evaluation of the evidence." Idaho Code § 67-5251(5); IDAPA 37.01.01.600.

3. Idaho Code § 42-602 states that, "The director of the department of water resources shall have discretion and control of the distribution of water from all natural sources . . . . The director of the department of water resources shall distribute water . . . in accordance with the prior appropriation doctrine." According to the Hearing Officer, "It is clear that the Legislature did not intend to grant the Director broad powers to do whatever the Director might think right. However, it is clear also that the Legislature [in Idaho Code § 42-602] did not intend to sum up water law in a single sentence of the Director's authority." R. Vol. 37 at 7085. "Given the nature of the decisions which must be made in determining how to respond to a delivery call, there must be some exercise of discretion by the Director." *American Falls Res. Dist. No. 2 v. Idaho Dept. Water Resources*, 143 Idaho 862, 875, 154 P.3d 433, 446 (2007).

4. "The prior appropriation doctrine is comprised of two bedrock principles—that the first appropriator in time is the first in right and that water must be placed to a beneficial use." *In Matter of Distribution of Water to Various Water Rights Held by or for the Benefit of A & B Irrigation Dist.*, 155 Idaho 640, 650, 315 P.3d 828, 838 (2012). "The concept that beneficial use acts as a measure and limit upon the extent of a water right is a consistent theme in Idaho water law." *Id.*; *American Falls*, 143 Idaho at 879, 154 P.3d at 450 (stating that while an appropriation for a beneficial use is "a valuable right entitled to protection . . . . Nevertheless, that property right is still subject to other requirements of the prior appropriation doctrine."); *Idaho Ground Water Assoc. v. Idaho Dep't of Water Res.*, 160 Idaho 119, 131, 369 P.3d 897, 909

(2016) (explaining the "policy of beneficial use" serves as a "limit on the prior appropriation doctrine.").

5. "Concurrent with the right to use water in Idaho 'first in time,' is the obligation to put that water to beneficial use." *American Falls*, 143 Idaho at 880, 154 P.3d at 451; *see In re Distribution of Water to Various Water Rights Held by or for the Ben. of A&B Irr. Dist.*, 155 Idaho at 652, 315 P.3d at 840 (quoting *American Falls*, 143 Idaho at 876, 154 P.3d at 447) (referring to "'the constitutional requirement that priority over water be extended only to those using the water'"). "'It is the settled law of this state that no person can, by virtue of a prior appropriation, claim or hold more water than is necessary for the purpose of the appropriation, and the amount of water necessary for the purpose of irrigation of the lands in question and the condition of the land to be irrigated should be taken into account.'" *In re Distribution of Water to Various Water Rights Held by or for the Ben. of A&B Irr. Dist.*, 155 Idaho at 650, 315 P.3d at 838 (quoting *Washington State Sugar v. Goodrich*, 27 Idaho 26, 44, 147 P. 1073, 1079 (1915)).

6. "[T]he policy of securing the maximum use and benefit, and least wasteful use of Idaho's water resources, has long been the policy in Idaho." *Idaho Ground Water Assoc.*, 160 Idaho at 131, 369 P.3d at 909 (citing *Clear Springs Foods, Inc. v. Spackman*, 150 Idaho 790, 808, 252 P.3d 71, 89 (2011)). The Idaho Constitution enunciates a policy of promoting "optimum development of water resources in the public interest." Idaho Const. Art. XV, § 7; *Baker v. Ore-Ida Foods, Inc.,* 95 Idaho 575, 584, 513 P.2d 627, 636 (1973). "There is no difference between securing the maximum use and benefit and least wasteful use of this State's water resources and the optimum development of water resources in the public interest. Likewise, there is no material difference between 'full economic development' and the 'optimum development of water resources in the public interest.' They are two sides of the same coin. Full economic development is the result of the optimum development of water resources in the public interest." *Clear Springs*, 150 Idaho at 809, 252 P.3d at 90. "The policy of securing the maximum use and benefit, and least wasteful use, of the State's water resources applies to both surface and ground waters, and it requires that they be managed conjunctively." *Id.*

7. "Conjunctive administration 'requires knowledge by the [Department] of the relative priorities of the ground and surface water rights, how the various ground and surface water sources are interconnected, and how, when, where and to what extent the diversion and use of water from one source impacts the water flows in that source and other sources.' . . . . That is precisely the reason for the CM Rules and the need for analysis and administration by the Director." *American Falls,* 143 Idaho at 877, 154 P.3d at 448.

8. The CM Rules incorporate all principles of the prior appropriation doctrine as established by Idaho law. *American Falls*, 143 Idaho at 873, 154 P.3d at 444; CM Rule 20.02, 10.12.

9. While the presumption under Idaho law is that an appropriator is entitled to his decreed water right and the CM Rules may not be applied to require a senior appropriator to demonstrate an entitlement to the water in the first place, there may be post-adjudication factors relevant to the determination of how much water is actually needed in responding to a delivery call. *American Falls*, 143 Idaho at 877-78, 154 P.3d at 448-49. Under the CM Rules and Idaho law, the Director has the "authority and responsibility to investigate claims when delivery calls

are made," and the "authority to evaluate the issue of beneficial use in the administration context." *In re Distribution of Water to Various Water Rights Held by or for the Ben. of A&B Irr. Dist.*, 155 Idaho at 652, 315 P.3d at 840. As the Idaho Supreme Court stated, "'[w]hile the prior appropriation doctrine certainly gives pre-eminent rights to those who put water to beneficial use first in time, this is not an absolute rule without exception . . . the Idaho Constitution and statutes do not permit waste and require water to be put to beneficial use or be lost.'" *Idaho Ground Water Assoc.*, 160 Idaho at 131, 369 P.3d at 909 (quoting *American Falls*, 143 Idaho at 880, 154 P.3d at 433). "[T]he Director must have some discretion to balance these countervailing considerations in a delivery call." *Id*. "'If this Court were to rule the Director lacks the power in a delivery call to evaluate whether the senior is putting the water to beneficial use, we would be ignoring the constitutional requirement that priority over water be extended only to those using the water.'" *In re Distribution of Water to Various Water Rights Held by or for the Ben. of A&B Irr. Dist.*, 155 Idaho at 652, 315 P.3d at 840 (quoting *American Falls*, 143 Idaho at 876, 154 P.3d at 447).

10. In responding to a delivery call under the CM Rules, the Director "may employ a baseline methodology as a starting point for considering material injury," provided the baseline methodology otherwise comports with the prior appropriation doctrine as established by Idaho law. *In re Distribution of Water to Various Water Rights Held by or for the Ben. of A&B Irr. Dist.*, 155 Idaho at 653, 315 P.3d at 841; *see Methodology Remand Order* at 17.

11. Once the Director determines "that material injury is occurring or will occur," junior appropriators subject to the delivery call bear "the burden of proving that the call would be futile or to challenge, in some other constitutionally permissible way, the senior's call." *American Falls*, 143 Idaho at 878, 154 P.3d at 449; *Methodology Remand Order* at 31. Junior appropriators have the burden of proving by clear and convincing evidence that the delivery call is futile or otherwise unfounded. *In re Distribution of Water to Various Water Rights Held by or for the Ben. of A&B Irr. Dist.*, 155 Idaho at 653, 315 P.3d at 841.

12. "This case illustrates the tension between the first in time and beneficial use aspects of the prior appropriation doctrine." *In re Distribution of Water to Various Water Rights Held by or for the Ben. of A&B Irr. Dist.*, 155 Idaho at 650, 315 P.3d at 838. The Idaho Supreme Court has in this case "recognized the critical role of the Director in managing the water resources to accommodate both first in time and beneficial use aspects: 'Somewhere between the absolute right to use a decreed water right and an obligation not to waste it and to protect the public's interest in this valuable commodity, lies an area for the exercise of discretion by the Director.'" *Id.* at 651, 315 P.3d at 839 (quoting *American Falls*, 143 Idaho at 880, 154 P.3d at 451). Thus, in this case the Director may use "a baseline methodology, both as a starting point for consideration of the Coalition's call and in determining the issue of material injury." *Id.* at 650-51, 315 P.3d at 838-39. However, "[i]f changing conditions establish that material injury is greater than originally determined pursuant to the baseline analysis, then adjustments to the mitigation obligation of the juniors must be made when the Director undertakes his mid-season calculations." *Methodology Remand Order* at 18.

13. In the context of conjunctive administration, the Director's methodology for projecting material injury does not impose an obligation upon members of the SWC to reprove

their water rights. To the extent water is available, members of the SWC are authorized to divert and store water in accordance with the terms of their licenses or decrees. Nothing established herein reduces that authorization. The question that the CM Rules require the Director to answer in this proceeding is, when water is not available to fill the water rights of the SWC, how much water is reasonably necessary for the SWC to accomplish the beneficial purpose of raising crops; because what is needed to irrigate crops may be less than the decreed or licensed quantities. *American Falls*, 143 Idaho at 880, 154 P.3d at 451; *see In re Distribution of Water to Various Water Rights Held by or for the Ben. of A&B Irr. Dist.*, 155 Idaho at 650, 315 P.3d at 838 (quoting *Washington State Sugar*, 27 Idaho at 44, 147 P. at 1079) ("'[i]t is the settled law of this state that no person can, by virtue of a prior appropriation, claim or hold more water than is necessary for the purpose of the appropriation"). Again, "[t]he concept that beneficial use acts as a measure and limit upon the extent of a water right is a consistent theme in Idaho water law." *Id.*

14. Holders of senior-priority water rights may receive less than their licensed or decreed quantities and not suffer material injury within the meaning of the CM Rules. As a result, in-season demand should be viewed in light of reasonableness and optimum development of water resources in the public interest. CM Rules 20 and 42; *American Falls*, 143 Idaho at 876-80, 154 P.3d at 447-51; *In re Distribution of Water to Various Water Rights Held by or for the Ben. of A&B Irr. Dist.*, 155 Idaho at 650-652, 315 P.3d at 838-40.

15. Here, the Director has established a methodology for determining material injury to members of the SWC. The methodology predicts material injury to RISD by taking the difference between RISD and the FS. The years 2000 through 2021 were analyzed to select the BLY because the period of years captured current irrigation practices in a dry climate. Based upon evaluation of the record, members of the SWC were exercising more reasonable efficiencies during this time period than during the 1990s when supplies were more plentiful. During periods of drought when junior ground water users are subject to curtailment, members of the SWC should exercise reasonable efficiencies to promote the optimum utilization of the State's water resources. CM Rules 20 and 42; *American Falls,* 143 Idaho at 876-80, 154 P.3d at 447-51; *Clear Springs*, 150 Idaho at 807-10; 252 P.3d at 88-91; *In re Distribution of Water to Various Water Rights Held by or for the Ben. of A&B Irr. Dist.*, 155 Idaho at 650-652, 315 P.3d at 838-40.

16. At this time, with the recognition that the methodology is subject to adjustment and refinement, RISD will be equal to the historic demands associated with the BLY (2018) and will be corrected during the season to account for variations in climate and water supply between the BLY and actual conditions.

17. Recognizing that climate and surface water supplies (natural flow and storage) are inherently variable, the Director's predictions of material injury to RISD and reasonable carryover are based upon the best available information and the best available science, in conjunction with the Director's professional judgment as the manager of the State's water resources. Recognizing his ongoing duty to administer the State's water resources, the Director should use available data, and consider new analytical methods or modeling concepts, to evaluate the methodology. As more data is gathered and analyzed, the Director will continue to

review and refine the process of predicting and evaluating material injury. The methodology will continue to be adjusted if the data supports a change.

18. If the Director predicts that the SWC will be materially injured because of a demand shortfall prediction, either in the preseason or in the midseason, the demand shortfall represents a mitigation obligation that must be borne by junior ground water users. If mitigation water in the amount of the projected RISD shortfall cannot be secured or optioned by junior ground water users to the satisfaction of the Director, the Director will curtail junior ground water users to make up any deficit. *See* Order on Pet. for Jud. Rev., at 19, *A&B Irrigation District v. Idaho Dairymen's Association, Inc.*, No. 2008-0000551 (Gooding Cnty. Dist. Ct. Idaho July 24, 2009),

19. In previous years, the Director used steady-state modeling when determining the curtailment priority date. The Department now has multiple years of experience with the methodology to better understand the impact of applying steady-state modeling versus transient modeling to determine a curtailment priority date that would supply adequate water to the senior water right holders. While the first version of the ESPA groundwater flow model was not calibrated at a time-scale that supported in-season transient modeling, the current version was calibrated using monthly stress periods and half-month time steps, a refinement that facilitates in-season transient modeling for calculating the response to curtailment of groundwater use. As part of the Director's ongoing obligation to evaluate the methodology, the Director must evaluate whether the use of steady-state continues to be supportable.

20. In surface water administration, uses by holders of junior priority surface water rights are curtailed until the senior surface water rights are fully satisfied, absent a futile call and if the senior surface water users need the water to accomplish a beneficial use. In other words, under surface water administration, junior surface water rights are generally curtailed unless the senior gets water in the quantity and at the time and place required.

21. Rule 43 of the CM Rules mandates that when the Director evaluates a mitigation plan, the mitigation plan must ensure that water is delivered to holders of senior priority surface water rights in both the quantity and at the time and place required by the senior. In considering a proposed mitigation plan pursuant to Rule 43, the Director must evaluate:

> **b.** Whether the mitigation plan will provide replacement water, *at the time and place required by the senior-priority water right*, sufficient to offset the depletive effect of ground water withdrawal on the water available in the surface or ground water source *at such time and place as necessary* to satisfy the rights of diversion from the surface or ground water source. Consideration will be given to the history and seasonal availability of water for diversion so as not to require replacement water at times when the surface right historically has not received a full supply, such as during annual low-flow periods and extended drought periods.
> **c.** Whether the mitigation plan provides replacement water supplies or other appropriate compensation to the senior-priority water right *when needed during a time of shortage* even if the effect of pumping is spread over many years and will continue for years after pumping is curtailed. A mitigation plan may allow for

> multi-season accounting of ground water withdrawals and provide for replacement water to take advantage of variability in seasonal water supply. The mitigation plan must include contingency provisions to assure protection of the senior-priority right in the event the mitigation water source becomes unavailable.

IDAPA 37.01.03.11.043.b-c (emphasis added). In other words, there is an assumption that senior water right holders calling for delivery of water under the CM Rules will receive, by curtailment or by mitigation, "replacement water at the time and place required by the senior-priority water right, sufficient to offset the depletive effect of ground water withdrawal . . . ." Only in a mitigation plan can "multi-season accounting of ground water withdrawals" be employed, and even then, the plan must "assure protection of the senior-priority right in the event the mitigation water source becomes unavailable."

22. The Director has an obligation to address a mitigation deficiency in the year it occurs. Mem. Decision & Order on Pet. for Jud. Rev., at 10, *Rangen, Inc. v. Idaho Dep't of Water Res.*, No. CV-2014-2446 (Twin Falls Cnty. Dist. Ct. Idaho Dec. 3, 2014); Mem. Decision & Order, at 8–9, *Rangen, Inc. v. Idaho Dep't of Water Res.*, No. CV-2014-4970 (Twin Falls Cnty. Dist. Ct. Idaho June 1, 2015).

23. As described in Finding of Fact 87, curtailment to a priority date calculated by the steady state analysis method used in the Fourth Methodology Order will only offset 9% to 15% of the predicted IDS. In contrast, curtailment to a priority date calculated with a transient simulation of a single season curtailment will offset the *full* predicted IDS unless the shortfall exceeds the accruals to the near Blackfoot to Minidoka reach by the end of the irrigation season with curtailment of all junior ground water rights. This methodology order depends on an annual evaluation of material injury and should also employ curtailment and or mitigation that supplies replacement water at the time and place required by the senior-priority water right in a quantity sufficient to offset the depletive effect of ground water withdrawal and to assure protection of the senior-priority right. Curtailment dates, periodically determined at time of recalculating in-season demand shortfall (IDS), should be calculated by a transient model simulation that will return the full quantity of water to the senior priority rights at the time and place required.

24. As described in Conclusion of Law 18, junior ground water users with approved mitigation plans to deliver storage water as mitigation must, to the satisfaction of the Director, secure or option mitigation water to avoid curtailment. By requiring that junior ground water users secure mitigation water or have options to acquire water in place during the season of need, the Director ensures that the SWC does not carry the risk of shortage to their supply. By not requiring junior ground water users to deliver or assign mitigation water until the Time of Need, the Director ensures that junior ground water users supply only the amount of mitigation water necessary to satisfy the RISD. All approved methods of mitigation shall be considered in the Director's review of projected RISD shortfall.

25. Unless there is reasonable certainty that junior ground water users can secure the predicted volume of water and provide that water at the Time of Need, the protection afforded to the senior water right holders is compromised. The risk of shortage is then impermissibly shouldered by the SWC. Members of the SWC should have certainty entering the irrigation

season and at midseason that mitigation water will be delivered or assigned at the Time of Need, or curtailment of junior ground water rights will be ordered.

26. Because climate and the supply that the SWC appropriated (natural flow and storage) are inherently variable, the Director cannot and should not insulate the SWC against all shortages. The Director can, however, protect the SWC against reasonably predicted shortages to RISD.

27. Currently, the USBR and USACE's Joint Forecast is an indispensable predictive tool at the Director's disposal for predicting material injury to RISD. Given current forecasting techniques, the earliest the Director can predict material injury to RISD with reasonable certainty is soon after the Joint Forecast is issued in early April. The pre-irrigation season supply forecast for A&B and Milner can be predicted solely from the Joint Forecast. To improve the accuracy of prediction, the pre-irrigation season supply forecast for AFRD2, BID, Minidoka, NSCC, and TFCC will currently be predicted from both the Joint Forecast and from flow data at Box Canyon.[24]

28. By shifting the April Forecast Supply prediction curve down one standard error of estimate, the Director purposely underestimates the water supply that is predicted. The Director further guards against RISD shortage by using the 2018 BLY, which has above average diversions, above average ET, below average in-season precipitation, and above average growing degree days. The 2018 BLY represents a year in which water supply did not limit diversions. The Director's prediction of material injury to RISD is purposely conservative. While it may ultimately be determined after final accounting that less mitigation water was owed than was provided, this is an appropriate burden for junior appropriators to carry. Idaho Cost. Art. XV, § 3; Idaho Code § 42-106. Shifting the prediction curve down one standard error of estimate and adoption of a BLY that uses above average diversions, above average temperatures and ET and below average precipitation is necessary to protect senior rights if the Director administers to an amount less than the full decreed quantity of the SWC's rights. *Methodology Remand Order* at 33, 35.

29. The Director will review, at the end of the season, the volume and efficiencies of application of surface water, the amount of mitigation water provided by junior ground water users, and may, in the exercise of his professional judgment, readjust the reasonable carryover shortfalls to reflect these considerations.

30. "Storage water is water held in a reservoir and is intended to assist the holder of the water right in meeting their decreed needs." *American Falls*, 143 Idaho at 878, 154 P.3d at 449. "Carryover is the unused water in a reservoir at the end of the irrigation year which is retained or stored for future use in years of drought or low-water." *Id.* Under Idaho Code, "[o]ne may acquire storage water rights and receive a vested priority date and quantity, just as with any other water right," but "[t]here is no statutory provision for obtaining a decreed right to 'carryover' water." *Id.* Rather, carryover is a "component of the storage right." Order on Pet. for Jud. Rev., at 20, *A&B Irrigation District v. Idaho Dairymen's Association, Inc.*, No. 2008-

[24] The method for predicting the natural flow supply may be subject change based upon improved predictive models.

0000551 (Gooding Cnty. Dist. Ct. Idaho July 24, 2009). Storage carryover is "permissible . . . absent abuse." *American Falls*, 143 Idaho at 880, 154 P.3d at 451.

31. The storage reservoirs implicated in this proceeding were intended to provide supplemental supplies of water "to create a buffer against the uncertainty of the weather." *Opinion Constituting Findings of Fact, Conclusions of Law and Recommendation* (April 29, 2008) at 6. "The history of the development of the reservoir system, most recently Palisades, makes it clear that storage of water was a primary purpose to prevent disaster during periods of shortage as have been experienced in the recent past." *Id*. at 60. The purpose of carryover also is "insurance against the risk of future shortage." Order on Pet. for Jud. Rev., at 20, *A&B Irrigation District v. Idaho Dairymen's Association, Inc.*, No. 2008-0000551 (Gooding Cnty. Dist. Ct. Idaho July 24, 2009).

32. CM Rule 42.01 sets forth factors the Director "may consider in determining whether the holders of water rights are suffering material injury and using water efficiently and without waste." CM Rule 42.01 does not limit the Director's determination of reasonable carryover to consideration of the factors enumerated in CM Rule 42.01g, but only requires that the Director consider those enumerated factors. One such factor is "[t]he extent to which the requirements of the holder of a senior priority water right could be met with the user's existing facilities and water supplies." CM Rule 42.01g. This factor is qualified, however, by the provision that "the holder of a surface water storage right shall be entitled to maintain a reasonable amount of carry-over storage to assure water supplies for future dry years." CM Rule 42.01g. Thus, CM Rule 42.01g does not require water right holders to exhaust their storage water supplies prior to making a delivery call under the CM Rules. This is consistent with the purposes of the storage reservoirs and the carryover components of the storage water rights.

33. In considering CM Rule 42.01g in *American Falls*, the Idaho Supreme Court framed the SWC's challenge to the "reasonable carryover" provision as presenting the question of whether the holders of storage water rights are "entitled to insist on all available water to carryover for future years in order to assure that their full storage water is met (regardless of need)," *American Falls,* 143 Idaho at 879, 154 P.3d at 450, and answered this question in the negative:

> At oral argument, one of the irrigation district attorneys candidly admitted that their position was that they should be permitted to fill their entire storage water right, regardless of whether there was any indication that it was necessary to fulfill current or future needs and even though the irrigation districts routinely sell or lease the water for uses unrelated to the original rights. This is simply not the law of Idaho. While the prior appropriation doctrine certainly gives pre-eminent rights to those who put water to beneficial use first in time, this is not an absolute rule without exception. As previously discussed, the Idaho Constitution and statutes do not permit waste and require water to be put to beneficial use or be lost. Supra, paragraph 11.

Id. at 880, 154 P.3d at 451.

34. As discussed in the Findings of Fact, reasonable carryover is determined by projecting the water supply for the system. This is accomplished by projecting the 2002/2004 natural flow and average annual storage fill and the 2018 demand. Next, the Director examines the average annual rate of fill of each SWC entity's reservoir space to determine each entity's relative probability of fill. Finally, the Director examines the average annual carryover for prior comparable water conditions by reviewing Heise natural flow.

35. On or before November 30, the Department will issue estimates of actual carryover and reasonable carryover shortfall volumes for all members of the SWC. These estimates will establish the obligation of junior ground water users in providing water to the SWC for reasonable carryover shortfall. Fourteen (14) days following the issuance by the Department of reasonable carryover short fall obligations, junior ground water users will be required to establish, to the satisfaction of the Director, their ability to supply a volume of storage water or to conduct other approved mitigation activities that will provide water to the injured members of the SWC equal to the reasonable carryover shortfall for all injured members of the SWC. If junior ground water users cannot provide this information, the Director will issue an order curtailing junior ground water rights.

36. Recognizing that reservoir space held by members of the SWC may fill, and to prevent the waste of water, junior ground water users are not required to deliver or assign the volume of reasonable carryover until after the Day of Allocation (defined in footnote 27, *infra*). Junior ground water users are obligated to hold the secured or optioned mitigation water until reservoir space held by the SWC fills. If the reservoir space does not fill, junior ground water right holders must deliver or assign the secured or optioned mitigation water to the senior water right holders up to the amount of storage space that did not fill.

ORDER

Consistent with the forgoing, the Director HEREBY ORDERS that, for purposes of determining material injury to RISD and reasonable carryover, the following steps will be taken:

1. Step 1: By April 1, members of the SWC will submit electronic shape files to the Department delineating the total anticipated irrigated acres for the upcoming year within their water delivery boundary or confirm in writing that the existing electronic shape file submitted by SWC has not varied by more than five percent. Department staff will review submitted shapefiles and modify them as necessary to ensure that: (1) the total acreage count does not exceed the decreed number of acres; (2) all of the irrigated land is located within the decreed place of use; and (3) acres are not counted more than once due to overlapping polygons within a shape file or between shape files submitted by different SWC members. Because the SWC members can best determine the irrigated acres within their service area, the SWC should be responsible for submitting the information to the Department. If this information is not timely submitted, the Department will determine the total irrigated acres based upon past cropping patterns and current satellite and/or aerial imagery. If a SWC member fails or refuses to identify the number of irrigated acres within its service area by April 1, the Department will be cautious about recognizing acres as being irrigated if there is uncertainty about whether the acres are or will be irrigated during the upcoming irrigation season. The Department will electronically post

electronic shape files for each member of the SWC for the current water year for review by the parties. In determining the total irrigated acreage, the Department may account for supplemental ground water use. The Department currently does not have sufficient information to accurately determine the contribution of supplemental ground water to lands irrigated with surface water by the SWC. If and when reliable data is available to the Department, the methodology will be amended to account for the supplemental ground water use.

2. If the acreage count is under reported by more than five percent of the irrigated acreage limit of the water right, then the Department will assess the impact of this reduction in use of the water right on any mitigation requirement.

3. Step 2: Typically within the first two weeks of April, the USBR and USACE issue their Joint Forecast that predicts an unregulated inflow volume at the Heise Gage for the period April 1 through July 31. Within fourteen (14) days after issuance of the Joint Forecast, the Director will issue a final order predicting the April FS for the water year for each SWC entity. The Director will compare the April FS for each SWC entity to the BD for each SWC entity to determine if an in-season demand shortfall ("IDS") is anticipated for the upcoming irrigation season. The April FS for each SWC entity is the sum of the forecasted natural flow supply and the forecasted storage allocation for each SWC entity. The forecasted natural flow supply will be computed with regression algorithms. The forecasted storage allocation will be determined by comparing storage accruals in an analogous year(s). A transient ESPAM simulation will be run to calculate the curtailment priority date predicted to produce a volume of water equal to the IDS in the near Blackfoot to Minidoka reach between May 1 and September 30 of the current year. Curtailment will be simulated within the area of common ground water supply as described by CM Rule 50.01.

4. Step 3: By May 1, or within fourteen (14) days from issuance of the final order predicting the April FS, whichever is later in time, junior ground water users with approved mitigation plans for delivery of water must secure, to the satisfaction of the Director, a volume of water equal to their proportionate share of the April IDS unless the April IDS is revised as explained below in paragraph 6. If junior ground water users secured water for a reasonable carryover shortfall to an individual SWC member in the previous year, the current-year mitigation obligation to the individual SWC member will be reduced by the quantity of water secured for the reasonable carryover shortfall. The secured water will not be required to be delivered to the injured members of the SWC until the Time of Need.

5. Step 4: As soon as practical after the deadline for junior ground water users with approved mitigation plans to provide notice of secured water, the Director will issue an order curtailing junior ground water users who: (1) do not have approved mitigation plans; (2) fail to secure the required water consistent with their approved mitigation plans; or (3) otherwise fail to comply with their approved mitigation plans.[25]

[25] This presumes that any reasonable carryover obligation has been met, and that junior ground water users are not already under prior curtailment from deficiencies in meeting the previous year's obligation.

6. If, at any time prior to the Director's final determination of the April FS, the Director can determine with certainty that any member of the SWC has diverted more natural flow than predicted, or has accrued more storage than predicted, the Director will revise his initial, projected demand shortfall determination.

7. Step 5: If the storage allocations held by members of the SWC fill, there is no reasonable carryover shortfall. If the storage allocations held by members of the SWC do not fill, within fourteen (14) days following the publication of Water District 01's initial storage report, which typically occurs soon after the Day of Allocation,[26] the volume of water secured by junior ground water users to fulfill the reasonable carryover shortfall shall be made available to injured members of the SWC. The amount of reasonable carryover to be provided shall not exceed the empty storage space on the Day of Allocation for that entity. If water is owed in addition to the reasonable carryover shortfall volume, this water shall be delivered or assigned to members of the SWC at the Time of Need, described below. The Time of Need will be no earlier than the Day of Allocation.

8. Step 6: Approximately halfway through the irrigation season, but following the events described in Step 5, the Director will, for each member of the SWC: (1) recalculate RISD; (2) issue a revised FS and (3) estimate the Time of Need date.[27]

9. RISD will be calculated utilizing the project efficiency, BD, and the cumulative actual CWN determined up to that point in the irrigation season. The cumulative CWN volume will be calculated for all land irrigated with surface water within the boundaries of each member of the SWC. Volumetric values of CWN will be calculated using ET and precipitation values from the USBR's AgriMet program, irrigated areas provided by each entity, and crop distributions based on NASS data.

10. The FS for each SWC is the sum of the year-to-date actual natural flow diversions, the forecasted natural flow supply for the remainder of the season, and the storage allocation for each member of the SWC. The forecasted natural flow supply for the remainder of the season will be based on regression analysis. The storage allocation will be based on the actual preliminary storage allocations issued by the BOR and Water District 01. If the BOR and Water District 01 have not yet allocated stored water to spaceholders, the Department will predict the storage allocations based on an analogous year(s).

11. The calendar day determined to be the Time of Need is established by predicting the day in which the remaining storage allocation will be equal to reasonable carryover. The Time of Need will not be earlier than the Day of Allocation.

---

[26] The Day of Allocation is the time in the irrigation season when the Water District 01 watermaster can issue allocations to storage space holders after the reservoir system has achieved its maximum physical fill, maximum water right accrual, and any excess spill past Milner Dam has ceased. Tr. p. 902, lns. 7-25; p. 903, lns. 1-10.

[27] At the earliest established Time of Need for any member of the SWC, junior ground water users are required to provide remaining mitigation to all materially injured members of the SWC.

12. This information will be used to recalculate RISD and adjust the projected IDS for each member of the SWC. The Director will then issue revised RISD and DS values. Any increase to the projected IDS for each SWC entity is an additional mitigation obligation of the junior ground water users.

13. Upon a determination of an additional mitigation obligation, junior ground water users will be required to establish, to the satisfaction of the Director, their ability to secure a volume of storage water or to conduct other approved activities pursuant to an approved mitigation plan that will deliver the additional mitigation obligation water to the injured members of the SWC at the Time of Need. If junior ground water users fail or refuse to submit this information within fourteen (14) days from issuance of a Step 6 order, the Director will issue an order curtailing junior ground water users.[28] A transient ESPAM simulation will be run to determine the priority date to produce the necessary additional mitigation obligation volume by September 30 of the same year. Curtailment will be simulated within the area of common ground water supply, as described by CM Rule 50.01.

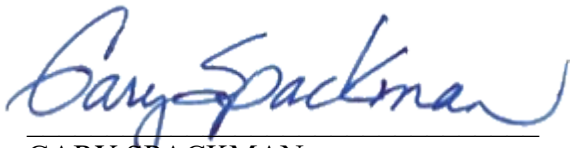
14. Step 7: Shortly before the estimated Time of Need, but following the events described in Steps 5 and 6, the Director will, for each member of the SWC: (1) recalculate RISD; (2) issue a revised FS; and (3) establish the Time of Need. The revised FS for each SWC entity is the sum of the year-to-date actual natural flow diversions, the forecasted natural flow supply for the remainder of the season, and the storage allocation for each member of the SWC. The forecasted natural flow supply for the remainder of the season will be based on analogous year(s) with similar Blackfoot to Milner reach gains. The storage allocation will be based on the actual preliminary storage allocations issued by the BOR and Water District 01.

15. This information will be used to recalculate RISD and adjust the projected IDS for each member of the SWC. RISD will be calculated utilizing the project efficiency, BD, and the cumulative actual CWN determined up to that point in the irrigation season. The Director will then issue revised RISD and IDS values.

16. A transient ESPAM simulation will be run to determine the priority date of water rights that must be curtailed to produce the demand shortfall volume by September 30 of the same year. Curtailment will be simulated within the area of common ground water supply, as described by CM Rule 50.01.

17. Step 8: At the Time of Need, junior ground water users are required to deliver to each injured member of the SWC the Step 7 revised IDS calculated at the Time of Need. Alternatively, any additional mitigation obligation calculated in Step 6 and Step 7 can be satisfied from each SWC member's reasonable carryover if (a) the reasonable carryover exceeds the additional mitigation obligation, and (b) the junior ground water users secure sufficient water to replace the reasonable carryover pursuant to an approved mitigation plan.

[28] This presumes that any reasonable carryover obligation has been met, and that junior ground water users are not already under prior curtailment from deficiencies in meeting the previous year's obligation.



18. The Director will review, at the end of the season, the volume and efficiencies of application of surface water, the amount of mitigation water delivered by junior ground water users, and may, in the exercise of his professional judgment, readjust the reasonable carryover shortfalls to reflect these considerations.

19. Step 9: Following the end of the irrigation season (on or before November 30), the Department will determine the total actual volumetric demand and total actual CWN for the entire irrigation season. This information will be used for the analysis of reasonable carryover shortfall, selection of future BLY, and for the refinement and continuing improvement of the method for future use.

20. On or before November 30, the Department will issue estimates of actual carryover and reasonable carryover shortfall volumes for all members of SWC. These estimates will be based on, but not limited to, the consideration of the best available water diversion and storage data from Water District 01, return flow monitoring, comparative years, and RISD. These estimates will establish the obligation of junior ground water users in providing water to the SWC for reasonable carryover shortfall. Fourteen (14) days following the issuance by the Department of reasonable carryover short fall obligations, junior ground water users will be required to establish, to the satisfaction of the Director, their ability to supply a volume of storage water or to conduct other approved mitigation activities that will provide water to the injured members of the SWC equal to the reasonable carryover shortfall for all injured members of the SWC. If junior ground water users cannot provide this information, the Director will issue an order curtailing junior ground water rights. A transient ESPAM simulation will be run to determine the priority date of water rights that must be curtailed to produce the reasonable carryover shortfall volume by September 30 of the following year. Curtailment will be simulated within the area of common ground water supply, as described by CM Rule 50.01.

IT IS FURTHER ORDERED that this Fifth Methodology Order supersedes all previously issued methodology orders in this matter.

Dated this _21st_ day of April 2023.

GARY SPACKMAN
Director

Administrative Assistant II

EXPLANATORY INFORMATION TO ACCOMPANY A FINAL ORDER

(To be used in connection with actions when a hearing was **not** held)

(Required by Rule of Procedure 740.02)

The accompanying order is a "**Final Order**" issued by the department pursuant to section 67-5246, Idaho Code.

PETITION FOR RECONSIDERATION

Any party may file a petition for reconsideration of a final order within fourteen (14) days of the service date of this order as shown on the certificate of service. **Note: The petition must be received by the Department within this fourteen (14) day period.** The department will act on a petition for reconsideration within twenty-one (21) days of its receipt, or the petition will be considered denied by operation of law. See section 67-5246(4), Idaho Code.

REQUEST FOR HEARING

Unless the right to a hearing before the director or the water resource board is otherwise provided by statute, any person who is aggrieved by the action of the director, and who has not previously been afforded an opportunity for a hearing on the matter shall be entitled to a hearing before the director to contest the action. The person shall file with the director, within fifteen (15) days after receipt of written notice of the action issued by the director, or receipt of actual notice, a written petition stating the grounds for contesting the action by the director and requesting a hearing. See section 42-1701A(3), Idaho Code. **Note: The request must be received by the Department within this fifteen (15) day period.**

APPEAL OF FINAL ORDER TO DISTRICT COURT

Pursuant to sections 67-5270 and 67-5272, Idaho Code, any party aggrieved by a final order or orders previously issued in a matter before the department may appeal the final order and all previously issued orders in the matter to district court by filing a petition in the district court of the county in which:

i. A hearing was held,
ii. The final agency action was taken,
iii. The party seeking review of the order resides, or
iv. The real property or personal property that was the subject of the agency action is located.

The appeal must be filed within twenty-eight (28) days of: a) the service date of the final order, b) the service date of an order denying petition for reconsideration, or c) the failure within twenty-one (21) days to grant or deny a petition for reconsideration, whichever is later. See section 67-5273, Idaho Code. The filing of an appeal to district court does not in itself stay the effectiveness or enforcement of the order under appeal.

Revised July 1, 2010

BEFORE THE DEPARTMENT OF WATER RESOURCES

OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **FINAL ORDER REGARDING APRIL 2023 FORECAST SUPPLY** **(METHODOLOGY STEPS 1–3)**

FINDINGS OF FACT

1. On April 21, 2023, the Director of the Idaho Department of Water Resources ("Department") issued his *Fifth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* ("Methodology Order"). The Methodology Order established nine steps for determining material injury to members of the Surface Water Coalition ("SWC"). This order applies steps 1, 2, and 3 of the Methodology Order.

A. Step 1

2. By April 1 of each year, Step 1 requires members of the SWC to submit to the Department electronic shapefiles delineating the total anticipated irrigated acres for the upcoming year "or confirm in writing that the existing electronic shape file submitted by SWC has not varied by more than five percent." *Methodology Order* ¶ 1 at 39.

3. On February 6, 2023, the Department received a letter from American Falls Reservoir District #2 ("AFRD2"), stating that its total number of irrigated acres has not varied by more than five percent.

4. On March 2, 2023, Minidoka Irrigation District ("Minidoka") submitted its electronic shapefile delineating its total irrigated acres to the Department.

5. On March 10, 2023, the Department received a letter from A&B Irrigation District ("A&B"), Burley Irrigation District ("BID"), Milner Irrigation District ("Milner"), North Side Canal Company ("NSCC") and Twin Falls Canal Company ("TFCC"), stating that their total number of irrigated acres for 2023 will not vary by more than five percent from the electronic shapefiles submitted in prior years.

6. Based on the information submitted by the SWC, the Department will use the following total irrigated acres:

	Total Irrigated Acres[1]	Data Source
A&B	15,924	SRBA Partial Decree
AFRD2	62,361	SRBA Partial Decree
BID	46,035	2013 shapefile submitted by BID, reduced by Department for overlapping acres and acres outside of service area.
Milner	13,264	2010 service area shapefile, reduced by Department for overlapping acres and acres outside of service area.
Minidoka	75,093	SRBA Partial Decree
NSCC	154,067	SRBA Partial Decree
TFCC	194,732	2013 shapefile submitted by TFCC, reduced by Department for overlapping acres and acres outside of service area.

B. Step 2

7. Step 2 states that, within fourteen days of the issuance of the joint forecast prepared by the United States Bureau of Reclamation and the United States Army Corp of Engineers, the Director "will issue a final order predicting the April [Forecast Supply] for the water year for each SWC entity. The Director will compare the April [Forecast Supply] for each SWC entity to the [Baseline Demand] for each SWC entity to determine if a in-season demand shortfall ("IDS") is anticipated for the upcoming irrigation season." *Methodology Order* ¶ 3 at 40.

8. On April 7, 2023, the joint forecast ("Joint Forecast") was announced, predicting an unregulated inflow 3,700,000 acre-feet at the Snake River near Heise gage for the period of April through July. The forecasted flow volume equates to 112% percent of average.[2] The Joint Forecast "is generally as accurate a forecast as is possible using current data gathering and forecasting techniques." *Id.* ¶ 49 at 18 (citation omitted).

9. The Heise natural flow data from years 1990–2022 were data inputs for development of regression equations for A&B and Milner to predict the natural flow supply.[3] Data greater or less than two standard deviations from average were excluded from the regression development.

10. The April–July Heise natural flow data from the years 1990–2022 and Box Canyon November–March total discharge data for the period 1989–2022, were data inputs for development of multiple linear regression equations to predict the natural flow supplies for

[1] The number of irrigated acres used in this methodology order is the number of reported acres unless that number is larger than the decreed irrigated acres, and if so, then the decreed acres were used.

[2] The average is based on the years 1991-2020. The Joint Forecast relies on a "30-Year Climate Normal" to calculate an Average April through July runoff volume.

[3] Attached hereto, as Attachment A, are the regression analyses for each SWC entity used to predict natural flow supply.

AFRD2, BID, Minidoka, NSCC, and TFCC. *Methodology Order* ¶ 49 at 18. The U.S. Geological Survey measures and monitors the flow at the Box Canyon stream flow measurement gage. The Box Canyon November–March total discharge used by the Director in the regression models for 2023 totaled 91,898 acre-feet.

11. The storage allocations were predicted for each SWC member. As of April 11, 2023, preliminary water right accounting for the 2023 irrigation year had not been completed. Storage allocations were calculated using an average of actual storage allocations of analogous years. The Surface Water Supply Index (SWSI)[4], produced by the Natural Resources Conservation Service (NRCS), is calculated by summing reservoir carryover and the forecasted spring and summer streamflow runoff. The April 1 SWSI indicates the water supply in 1993 and 2016 are analogous to the water supply in 2023. Based on the analogous years, the Director anticipates SWC members will receive 95–100% of their allocation. The storage allocations are based on the anticipated allocations minus evaporation charges.

12. Based on the above, the Director projects as follows:

	Predicted Natural Flow Supply	Predicted Storage Allocation	Minidoka Credit Adjustment	Total Supply	BLY 2018	Shortfall
A&B	14,833	135,411		150,244	64,192	0
AFRD2	115,223	387,853	1,000	504,076	453,890	0
BID	109,313	221,713	5,130	336,156	262,211	0
Milner	18,347	88,047		106,393	58,417	0
Minidoka	156,468	342,620	8,370	507,458	354,851	0
NSCC	457,802	819,773	-7,750	1,269,825	1,026,661	0
TFCC	820,663	232,606	-6,750	1,046,519	1,121,717	75,200
				Total Projected Demand Shortfall (AF)		75,200

C. Step 3

13. Step 3 requires the following:

> Step 3: By May 1, or within fourteen (14) days from issuance of the final order predicting the April FS, whichever is later in time, junior ground water users with approved mitigation plans for delivery of water must secure, to the satisfaction of the Director, a volume of water equal to their proportionate share of the April IDS unless the April IDS is revised as explained below in paragraph 6. If junior ground water users secured water for a reasonable carryover shortfall to an individual SWC member in the previous year, the current-year mitigation obligation to the

[4] SWSI is a predictive indicator of the surface water available in a basin compared to historic supply. The SWSI is produced monthly by the Natural Resources Conservation Service (NRCS). *See* Nat. Res. Conserv'n Serv., U.S. Dep't of Agric., *Surface Water Supply Index (SWSI)*, https://www.nrcs.usda.gov/wps/portal/nrcs/detail/id/snow/waterproducts/?cid=stelprdb1240689 (last visited Apr. 20, 2022).

individual SWC member will be reduced by the quantity of water secured for the reasonable carryover shortfall. The secured water will not be required to be delivered to the injured members of the SWC until the Time of Need.

Methodology Order ¶ 4 at 40.

14. The predicted April DS for TFCC is 75,200 acre-feet. The total predicted DS is 75,200 acre-feet.

15. The Eastern Snake Plain Aquifer Model ("ESPAM") is used to predict the junior priority water rights that must be curtailed to produce the volume of water equal to the predicted April DS in the near Blackfoot to Minidoka reach. The ESPAM is updated periodically as new field measurements and advancements in modeling technology become available. ESPAM Version 2.2 ("ESPAM2.2") is the current version. ESPAM2.2 model documentation reports (including a model calibration report, a predictive uncertainty analysis, a superposition model scenario, and a curtailment scenario) were finalized on May 27, 2021. *See* Idaho Dep't of Water Res., *ESPAM2.2 Reports* (2021), https:// research.idwr.idaho.gov/files/projects/espam/ browse/ESPAM22_Reports/.

16. The Department ran ESPAM2.2 to predict the junior priority water rights within the area of common ground water supply that must be curtailed to produce the volume of water equal to the predicted April DS between the May 1 and September 30 of this irrigation season pursuant to the *Fifth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover*. Ground water rights bearing priority dates later than December 30, 1953, must be curtailed to produce the volume of water equal to the predicted April DS in the near Blackfoot to Minidoka reach.

CONCLUSIONS OF LAW

1. The Fifth Judicial District Court, in and for the County of Minidoka, held that the evidentiary standard of proof to apply in conjunctive administration of hydraulically connected water rights is clear and convincing. *See* Mem. Decision & Order on Pets. for Jud. Rev., *A&B Irr. Dist., Inc. v. Idaho Dep't of Water Res.*, No. CV-2009-647 (Minidoka Cnty. Dist. Ct. Idaho May 4, 2010); Mem. Decision & Order on Pets. for Reh'g, *A&B Irr. Dist., Inc. v. Idaho Dep't of Water Res.*, No. CV-2009-647 (Minidoka Cnty. Dist. Ct. Idaho Nov. 2, 2010).

2. "Clear and convincing evidence refers to a degree of proof greater than a mere preponderance." *Idaho State Bar v. Topp*, 129 Idaho 414, 416, 925 P.2d 1113, 1115 (1996) (internal quotations removed). "Clear and convincing evidence is generally understood to be '[e]vidence indicating that the thing to be proved is highly probable or reasonably certain.'" *State v. Kimball*, 145 Idaho 542, 546, 181 P.3d 468, 472 (2008) (citing *In re Adoption of Doe*, 143 Idaho 188, 191, 141 P.3d 1057, 1060 (2006)); *see also Idaho Dep't of Health & Welfare v. Doe*, 150 Idaho 36, 41, 244 P.3d 180, 185 (2010).

3. The Director must utilize the best available technology for determining the impact of junior ground water diversions. *See Clear Springs Foods, Inc. v. Spackman*, 150 Idaho 790, 814,

252 P.3d 71, 95 (2011). ESPAM 1.1 and 2.1 are the model versions utilized previously in SWC delivery call proceedings. The Director determined that ESPAM 2.1 is the best available scientific tool for predicting the effects of ground water pumping. *See Idaho Ground Water Assoc. v. Idaho Dep't of Water Res.*, 160 Idaho 119, 124, 369 P.3d 897, 902 (2016). ESPAM 2.2 is the latest version of the ESPAM model. The improvements incorporated into ESPAM 2.2, as discussed in Finding of Fact 15, make it the best available scientific tool for predicting the effects of ground water pumping in this proceeding.

4. In 2023, the Director has sufficient information to quantify irrigated areas for each of the SWC members as required by Step 1.

5. The Joint Forecast predicts an unregulated inflow of 3,700,000 acre-feet at the Snake River near Heise gage for the period of April through July. The forecasted flow volume equates to 112% of average.

6. The April predicted DS is 75,200 acre-feet. Junior ground water users holding consumptive water rights bearing priority dates junior to December 30, 1953, within the Eastern Snake Plain Aquifer area of common ground water supply must mitigate for their proportionate share of the predicted DS in accordance with an approved mitigation plan.[5] Junior ground water users mitigating for their proportionate share of the predicted DS with a secured volume of water pursuant to an approved mitigation plan must, to the satisfaction of the Director, secure their proportionate share for delivery to the injured members of the SWC on or before May 5, 2023. There was a reasonable carryover shortfall of 49,309 acre-feet in the fall of 2022. However, because junior ground water users did not secure any mitigation water for a carryover shortfall, there is no adjustment to the mitigation obligation.

7. If, on or before May 5 2023, ground water users holding consumptive water rights bearing priority dates junior to December 30, 1953, within the Eastern Snake Plain Aquifer area of common ground water supply fail to establish, to the satisfaction of the Director, that they can mitigate for their proportionate share of the predicted DS of 75,200 acre-feet in accordance with an approved mitigation plan, the Director will issue an order curtailing the junior-priority ground water user. Junior ground water users who are mitigating with a secured volume of water are not required to assign the secured volume of water until after the Director issues a subsequent order requiring assignment of the water.

---

[5] There are seven approved mitigation plans in place responding to the SWC delivery call filed by: 1) A&B Irrigation District, 2) Southwest Irrigation District and Goose Creek Irrigation District (collectively, "SWID"), 3) the Idaho Ground Water Appropriators, Inc. ("IGWA"), 4) certain cities commonly referred to as the "Coalition of Cities", and 5) certain entities commonly referred to as the "Water Mitigation Coalition." A&B Irrigation District's proportionate share of the predicted DS of 75,200 acre-feet is 458 acre-feet. Due to the nature of the mitigation plans for SWID, the Coalition of Cities and the Water Mitigation Coalition, these entities do not need to establish that they can mitigate for their proportionate share of the predicted DS. IGWA has two approved mitigation plans. If IGWA is in compliance with mitigation plan CM-MP-2016-001, IGWA does not need to establish that it can mitigate for its proportionate share of the predicted DS. If IGWA seeks to provide mitigation by delivery of storage water as approved in mitigation plan CM-MP-2009-007, IGWA's proportionate share of the predicted DS of 75,198 acre-feet is 63,645 acre-feet.

8. If, at any time prior to the Director's final determination of the April Forecast Supply, the Director can determine with certainty that any member of the SWC has diverted more natural flow than predicted, or has accrued more storage than predicted, the Director will revise his initial, predicted DS determination.

ORDER

Based upon and consistent with the foregoing, IT IS HEREBY ORDERED as follows:

The Director predicts an in-season DS of 75,200 acre-feet. On or before May 5, 2023, ground water users holding consumptive water rights bearing priority dates junior to December 30, 1953, within the Eastern Snake Plain Aquifer area of common ground water supply shall establish, to the satisfaction of the Director, that they can mitigate for their proportionate share of the predicted DS of 75,200 acre-feet in accordance with an approved mitigation plan. If a junior ground water user cannot establish, to the satisfaction of the Director, that they can mitigate for their proportionate share of the predicted DS of 75,200 acre-feet in accordance with an approved mitigation plan, the Director will issue an order curtailing the junior-priority ground water user.

Dated this 21st day of April 2023.

GARY SPACKMAN
Director

CERTIFICATE OF SERVICE

I HEREBY CERTIFY that on this 21st day of April 2023, the above and foregoing, was served by the method indicated below, and addressed to the following:

EXPLANATORY INFORMATION TO ACCOMPANY A FINAL ORDER

(To be used in connection with actions when a hearing was **not** held)

(Required by Rule of Procedure 740.02)

The accompanying order is a **"Final Order"** issued by the department pursuant to section 67-5246, Idaho Code.

PETITION FOR RECONSIDERATION

Any party may file a petition for reconsideration of a final order within fourteen (14) days of the service date of this order as shown on the certificate of service. **Note: The petition must be received by the Department within this fourteen (14) day period.** The department will act on a petition for reconsideration within twenty-one (21) days of its receipt, or the petition will be considered denied by operation of law. See section 67-5246(4), Idaho Code.

REQUEST FOR HEARING

Unless the right to a hearing before the director or the water resource board is otherwise provided by statute, any person who is aggrieved by the action of the director, and who has not previously been afforded an opportunity for a hearing on the matter shall be entitled to a hearing before the director to contest the action. The person shall file with the director, within fifteen (15) days after receipt of written notice of the action issued by the director, or receipt of actual notice, a written petition stating the grounds for contesting the action by the director and requesting a hearing. See section 42-1701A(3), Idaho Code. **Note: The request must be received by the Department within this fifteen (15) day period.**

APPEAL OF FINAL ORDER TO DISTRICT COURT

Pursuant to sections 67-5270 and 67-5272, Idaho Code, any party aggrieved by a final order or orders previously issued in a matter before the department may appeal the final order and all previously issued orders in the matter to district court by filing a petition in the district court of the county in which:

i. A hearing was held,
ii. The final agency action was taken,
iii. The party seeking review of the order resides, or
iv. The real property or personal property that was the subject of the agency action is located.

The appeal must be filed within twenty-eight (28) days of: a) the service date of the final order, b) the service date of an order denying petition for reconsideration, or c) the failure within twenty-one (21) days to grant or deny a petition for reconsideration, whichever is later. See section 67-5273, Idaho Code. The filing of an appeal to district court does not in itself stay the effectiveness or enforcement of the order under appeal.

Revised July 1, 2010

BEFORE THE DEPARTMENT OF WATER RESOURCES

OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **NOTICE OF HEARING, NOTICE OF PREHEARING CONFERENCE, AND ORDER AUTHORIZING DISCOVERY**

On April 21, 2023, the Director of the Idaho Department of Water Resources ("Department") issued his *Fifth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* ("Methodology Order") as well as his *Final Order Regarding April 2023 Forecast Supply* ("As-Applied Order"). The Methodology Order revises the nine steps used to determine material injury to members of the Surface Water Coalition ("SWC"). The As-Applied Order predicts a shortfall for the 2023 irrigation season, which will result in mitigation requirements or curtailment for ground water rights with priority dates junior to December 30, 1953.

The Director anticipates that one or more parties will request a hearing pursuant to Idaho Code § 42-1701A(3) in response to one or both of the orders. Normally, a party has 15 days to request a hearing. However, time is of the essence because the irrigation season has commenced for many water users. Idaho's Constitutional Convention intended that there be no unnecessary delays in the delivery of water pursuant to a valid water right. *Am. Falls Reservoir Dist. No. 2 v. Idaho Dep't of Water Res.*, 143 Idaho 862, 874, 154 P.3d 433, 445 (2007). "Clearly, a timely response is required when a delivery call is made and water is necessary to respond to that call." *Id*. Accordingly, the Director, consistent with the obligation to timely administer water rights, will take the proactive step of setting the matter for hearing, will set a prehearing conference, and will authorize discovery. Should the parties mutually agree that a hearing is unwarranted, the parties may file a stipulated motion to vacate.

NOTICE OF HEARING

NOTICE IS HEREBY GIVEN that the Department will hold a hearing on the Methodology Order and As-Applied Order on **June 6–10, 2023. The hearing will begin on June 6 at 9:00 a.m. (MST).** Subsequent starting and ending times will be scheduled during the hearing. The last day of the hearing, June 10, is a Saturday. The day is reserved if needed to complete the hearing.

The hearing will take place at the Department's State Office, located at **322 E. Front Street, 6th Floor, Conference Rooms 602A–D, Boise, Idaho**.

All parties wishing to participate in the hearing shall be present in person. Remote participation will be allowed for those who wish to observe the hearing. To request remote participation information, contact Sarah Tschohl at the phone number or email listed below.

The hearing will be held in accordance with the provisions of Chapters 2 and 17, Title 42 and Chapter 52, Title 67, Idaho Code, as well as the Department's Rules of Procedure, IDAPA 37.01.01. A copy of the Rules of Procedure may be obtained from the Department upon request or at: https://adminrules.idaho.gov/rules/current/37/370101.pdf.

The hearing will be conducted in a facility that meets the accessibility requirements of the Americans with Disabilities Act. If you require special accommodation to attend, participate in, or understand the hearing, please advise the Department no later than five (5) days prior to the hearing. Inquiries for special accommodations should be directed to Sarah Tschohl, Idaho Department of Water Resources, P.O. Box 83720, Boise, Idaho 83720-0098, telephone: (208) 287-4815, email sarah.tschohl@idwr.idaho.gov.

NOTICE OF PREHEARING CONFERENCE

NOTICE IS HEREBY GIVEN that the Department will hold a prehearing conference on the Methodology Order and As-Applied Order on **April 28, 2023, at 1:30 p.m. (MST)**. The conference will take place at the Department's State Office, located at **322 E. Front Street, 6th Floor, Conference Rooms 602B–D, Boise, Idaho**. All parties wishing to participate in the prehearing conference must appear in person or by video conferencing. The parties shall come prepared to identify the issues to be addressed at the hearing.

To attend the conference via computer or smartphone, please click the following Webex link, follow the prompts, and wait to be admitted by the meeting host: https://idahogov.webex.com/idahogov/j.php?MTID=mb39d4fed7de1bfefe8462aaefafd3dbb.

To join the conference via telephone, please dial 1(415) 655-0001 (US Toll) and enter the following meeting access code when prompted: 2450 253 0090.

The prehearing conference will be held in accordance with the provisions of Chapter 17, Title 42, and Chapter 52, Title 67, Idaho Code, and the Department's Rules of Procedure, IDAPA 37.01.01. A copy of the Rules of Procedure may be obtained from the Department upon request or at https://adminrules.idaho.gov/rules/current/37/370101.pdf.

The conference will be conducted in a facility that meets the accessibility requirements of the Americans with Disabilities Act. If you require special accommodation to attend, participate in, or understand the conference, please advise the Department no later than one (1) day before the conference. Inquiries for special accommodations should be directed to Sarah Tschohl, Idaho Department of Water Resources, P.O. Box 83720, Boise, Idaho 83720-0098, telephone: (208) 287-4815, email sarah.tschohl@idwr.idaho.gov.

ORDER AUTHORIZING DISCOVERY

IT IS HEREBY ORDERED that the parties are authorized to immediately conduct and engage in discovery pursuant to IDAPA 37.01.01.521.

IT IS FURTHER ORDERED that, pursuant to IDAPA 37.01.01.053, documents filed in this proceeding may be served on the parties and the Department via email. Service on the Department shall be made by email to file@idwr.idaho.gov. Service on the parties shall be made by email to the email addresses listed in the Certificate of Service below.

Dated this 21st day of April 2023.

GARY SPACKMAN
Director

BEFORE THE DEPARTMENT OF WATER RESOURCES

OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	**Docket No. CM-DC-2010-001** **COALITION OF CITIES' REQUEST FOR HEARING**

COME NOW, the Cities of Bliss, Burley, Carey, Declo, Dietrich, Gooding, Hazelton, Heyburn, Jerome, Paul, Richfield, Rupert, Shoshone, and Wendell ("Coalition of Cities"), by and through their attorneys of record, McHugh Bromley, PLLC and files this Request for Hearing in the above captioned matter.

REQUEST FOR HEARING

Pursuant to Idaho Code § 42-1701(A)(3), the Coalition of Cities requests a hearing on the Department's *Fifth Amended Methodology Order Regarding Methodology For Determining Material Injury to Reasonable In-Season Demand And Reasonable Carryover*, issued April 14, 2023. Among the issues the Coalition of Cities has identified for hearing:

a) IDWR's new reliance on transient modeling;

b) IDWR's failure to properly identify the Surface Water Coalition's ("SWC") irrigated acreage used in the determination of reasonable in-season demand;

c) IDWR's failure to consider the Twin Falls Canal Company's increase in diversions over the last twenty years;

d) IDWR's failure to consider changes in the efficiency of the SWC'soperations;

e) IDWR's failure to consider all sources of supply available to the SWC;

f) IDWR's use of 2018 as the new baseline year;

g) IDWR's failure to apply Conjunctive Management Rule 20.03 and principles of reasonableness generally; and

h) IDWR's violation of due process rights of all interested water users by:

i) by engaging in an apparently sham public process related to the Department's convening of the "Technical Work Group" to discuss modifications to the Fourth Methodology Order and then largely ignoring that group's recommendations; and

ii) by a continued abuse of process, authority and power in setting the hearing without regard to the time required for discovery and without consideration of the existing obligations of the parties, their legal representatives and consultants and reflecting bias against junior water right uses.

Submitted this 28th day of April, 2023

BEFORE THE DEPARTMENT OF WATER RESOURCES

OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **MOTION FOR APPOINTMENT OF INDEPENDENT HEARING OFFICER**

COME NOW, the Cities of Bliss, Burley, Carey, Declo, Dietrich, Gooding, Hazelton, Heyburn, Jerome, Paul, Richfield, Rupert, Shoshone, and Wendell ("Coalition of Cities"), by and through their attorneys of record, Candice M. McHugh and Chris M. Bromley, the City of Idaho Falls, by and through its attorney of record, Robert L. Harris, and the City of Pocatello by and through its attorney of record Sarah A. Klahn (collectively the "Cities"),

pursuant to I.C. § 42-1701A(2) and IDAPA 37.01.01.410, and hereby moves the Director to appoint an independent hearing officer.

On April 21, 2023, the Director issued a series of orders regarding the Surface Water Coalition ("SWC") delivery call: *Fifth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* ("Methodology Order"); *Final Order Regarding April 2023 Forecast Supply (Methodology Steps 1-3)* ("As-Applied Order"); and *Notice of Hearing, Notice of Prehearing Conference, and Order Authorizing Discovery* ("Hearing Order").

The *Methodology Order* is a detailed, technical order, stating it is using the "best available science" to revise the Director's predictive tools for determining material injury to the SWC pursuant to the CM Rules. A material change in this *Methodology Order* from all prior decisions of the Director in the SWC delivery call is his decision to use the Eastern Snake Plain Aquifer Model ("ESPAM") in transient as opposed to steady-state. *See Methodology Order* at 35, ¶ 19. The significance of this policy change cannot be overstated, is unprecedented, and not understood.

The *As-Applied Order* uses the information from the *Methodology Order* and applies it to the first half of the 2023 irrigation season, to compute a "Demand Shortfall" of 75,200 acre-feet to Twin Falls Canal Company for the period April – July. Using a transient modeling run, ESPAM predicts that ground water rights that are junior to December 30, 1953 will need to be curtailed to satisfy the predicted injury. The predicted shortfall to TFCC in a year when the Upper Snake Reservoir systems is expected to fill and with the mountains of eastern Idaho currently containing more than 100% snow water equivalent, *see*

the *Motion for Continuance* filed contemporaneously by the Cities, results in an unprecedented quantification of material injury that defies logic.

Associated with the *As-Applied Order* is a link with files containing *April Background Information*. The *April Background Information* contains: historical diversion data for the SWC members; historical Heise flow data; analyses to estimate the 2023 shortages to the SWC members; transient ground water modeling files and results; irrigated area shape files for Minidoka Irrigation District.

The *Hearing Order* authorizes discovery, establishes that a prehearing conference will take place on April 28, 2023, and that the hearing in the contested case will commence on June 6, 2023. The *Hearing Order* does not specify if the Director will serve as the hearing officer.

Idaho Code § 42-1701A(2) provides that, "The director, in his discretion, may direct that a hearing be conducted by a hearing officer appointed by the director." IDAPA 37.01.01.410 allows for the appointment of a hearing officer who may be an "employee[] of the agency or [an] independent contractor[]."

If the Director elects to serve as the Hearing Officer, the Cities respectfully move him to appoint an independent hearing officer for the following reasons:

1. Since the 2005 delivery call was filed by the Surface Water Coalition ("SWC"), the only evidentiary hearing of any magnitude occurred in 2008, when former Chief Justice Gerald F. Schroeder served as the independent hearing officer and issued his April 29, 2008 Recommended Order. *A&B Irr. Dist. v. Spackman*, 155 Idaho 640, 645, 315 P.3d 828, 833 (2013). Former Chief Justice Schroeder's

Recommended Order lead former Director David R. Tuthill, Jr. to issue the first *Methodology Order* on April 7, 2010. *Id*. at 647, 315 P.3d 835. The first *Methodology Order* and orders implementing the same were addressed by the Court in its 2013 decision in *A&B v. Spackman*.

2. Since then, Director Spackman has issued updates to the *Methodology Order*, with the methodology now in its fifth iteration.

3. The *Methodology Order* that was issued on April 21, 2023, represents a sea-change in the use of predictive tools, updated data, and use of the Eastern Snake Plain Aquifer Model in a transient function, as opposed to steady-state, to quantify material injury and choose a priority date for curtailment. Despite this, the *Methodology Order* fails to update data as to SWC irrigation efficiencies, irrigation practices, irrigated area, among other topics that will need to be addressed at an evidentiary hearing with a fully developed record.

4. Former Chief Justice Schroeder was named as the hearing officer in response to the SWC's *Request for Independent Hearing Offficer; Disqualification of the Director as a Matter of Right* (June 4, 2007).[1] When former Chief Justice Schroeder was named as the hearing officer, former Director Tuthill issued an order not only appointing former Chief Justice Schroeder to serve, but he also stating that he would continue to administer water rights in response to the SWC delivery call: "The Director maintains jurisdiction over the ongoing administration of water rights related to this matter." *Order Appointing Hearing*

[1] SWC Request for Independent Hearing Officer; Disqualification of the Director as the Hearing Officer as a Matter of Right | June 4, 2007 | SWC (idaho.gov).

Officer (Aug. 1, 2007) (emphasis added).[2]

5. What was decided in 2007 holds true today. The Director has the tools by which to administer junior-priority ground water rights for the benefit of the SWC, with mitigation plans in place to protect most ground water users from curtailment while the hearing process plays out.
6. It has been eighteen years since the original SWC delivery call. It has been fifteen years since the evidentiary hearing before former Chief Justice Schroeder, meaning it has been fifteen years since an evidentiary hearing of any consequence has taken place. In those intervening fifteen years, many irrigation practices have likely changed, all of which deserve a hearing, based on a fully developed record, to be heard by an independent hearing officer for consideration by the Director.

Based on the foregoing, IDWR's practice is to appoint an independent hearing officer to preside over evidentiary hearings in the SWC delivery call. Cities agree with past practice respectfully move the Director to appoint an independent hearing officer.

Respectfully submitted this 28th day of April, 2023.

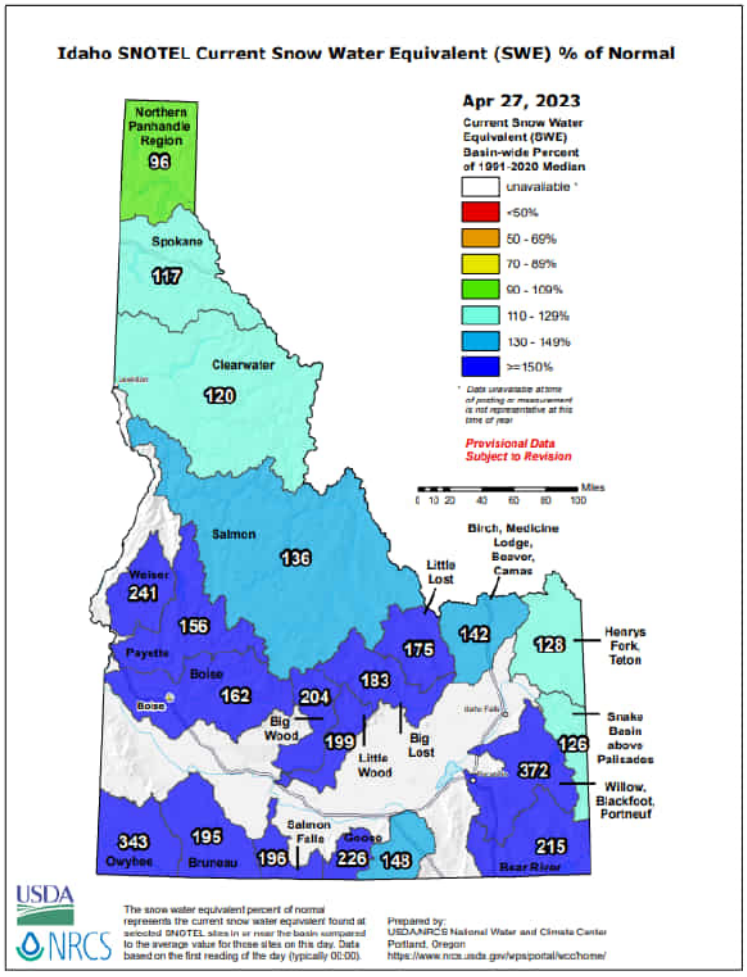
BEFORE THE DEPARTMENT OF WATER RESOURCES

OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	**Docket No. CM-DC-2010-001** **MOTION FOR CONTINUANCE**

COME NOW, the Cities of Bliss, Burley, Carey, Declo, Dietrich, Gooding, Hazelton, Heyburn, Jerome, Paul, Richfield, Rupert, Shoshone, and Wendell ("Coalition of Cities"), by and through their attorneys of record, Candice M. McHugh and Chris M. Bromley, the City of Idaho Falls, by and through its attorney of record, Robert L. Harris, and the City of Pocatello, by and through its attorney of record, Sarah A. Klahn (collectively the "Cities"),



pursuant to IDAPA 37.01.01.220 and IDAPA 37.01.01.560, and hereby move for continuance of the hearing scheduled for June 6-10, 2023, in the above-captioned matter.

On April 21, 2023, the Director issued a series of orders regarding the Surface Water Coalition ("SWC") delivery call: *Fifth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* ("Methodology Order"); *Final Order Regarding April 2023 Forecast Supply (Methodology Steps 1-3)* ("As-Applied Order"); and *Notice of Hearing, Notice of Prehearing Conference, and Order Authorizing Discovery* ("Hearing Order"). While the Cities are in full compliance with their approved mitigation plan, the Cities nevertheless remain subject to the *Methodology Order* and its significant analytical departure from the Fourth Methodology Order.

The *Methodology Order* is a detailed, technical order, stating it is using the "best available science" to revise the Director's predictive tools for determining material injury to the SWC pursuant to the CM Rules. The Director decided in this *Methodology Order* to make a material departure from all prior decisions in the SWC delivery call to use the Eastern Snake Plain Aquifer Model ("ESPAM") in transient as opposed to steady-state to predict the priority date for curtailment needed to satisfy that injury. *See Methodology Order* at 35, ¶ 19. The significance of this policy change cannot be overstated and is unprecedented.

The *As-Applied Order* uses the information from the *Methodology Order* and applies it to the first half of the 2023 irrigation season, to compute a "Demand Shortfall" of 75,200 acre-feet to Twin Falls Canal Company ("TFCC") for the period April – July. Using a transient modeling run, ESPAM predicts that ground water rights that are junior to

December 30, 1953 will need to be curtailed to satisfy the predicted injury. The predicted shortfall to TFCC in a year when the Upper Snake Reservoir systems is expected to fill and with the mountains of eastern Idaho currently containing more than 100% snow water equivalent, which is shown on the following page, results in an unprecedented quantification of material injury that defies logic:

https://www.wcc.nrcs.usda.gov/ftpref/data/water/wcs/gis/maps/id_swepctnormal_update.pdf

Associated with the *As-Applied Order* is a link with files containing *April Background Information*. The *April Background Information* contains: historical diversion data for the SWC members; historical Heise flow data; analyses to estimate the 2023

shortages to the SWC members; transient ground water modeling files and results; irrigated area shape files for Minidoka Irrigation District.

The *Hearing Order* authorizes discovery, establishes that a prehearing conference will take place on April 28, 2023, and that the hearing in the contested case will commence on June 6, 2023.

IDAPA 560 states: "The presiding officer may continue proceedings for further hearing." The Cities request that the hearing be continued until December 2023 or January 2024 for the following reasons:

1. The need for completion of adequate discovery by the parties. The Idaho Rules of Civil Procedure allows thirty (30) days for a party to respond to written discovery. If discovery is served on or after the prehearing conference, which is scheduled for April 28, 2023, answers would not be due until at least May 30, 2023, which is seven (7) days before the hearing is scheduled to commence. Additionally, compounding the already compressed schedule is the fact that Memorial Day is May 29, 2023. It is customary to have responses to written discovery before noticing depositions. Since written responses to discovery will not be available until after Memorial Day, it is simply not possible to have depositions before the June 6, 2023 hearing date.

2. The need for completion of expert reports and rebuttal reports. In order to properly formulate expert opinions and reports, the Cities require discovery from the parties as well as information from IDWR. Without discovery and information from IDWR, and based on what is understood now, issues that may be raised as expert opinions in expert reports include but are not limited to the following:

    a) IDWR's new reliance on transient modeling.

    b) IDWR's reliance on new data. IDWR has added seven (7) years of additional, voluminous hydrologic and water use data to the datasets used in the *Methodology Order* and *As-Applied Order*. There is insufficient time available to properly review and vet these data and how they were used in the revised calculations;

    c) IDWR's failure to properly identify the SWC's irrigated acreage used in the determination of reasonable in-season demand;

    d) IDWR's failure to consider TFCC's increase in diversions over the last twenty

years;

e) IDWR's failure to consider changes in the efficiency of SWC operations;

f) IDWR's failure to apply CM Rule 20.03 and principles of reasonableness generally; and

g) IDWR's violation of due process rights of all interested water users:

i. By engaging in an apparently sham public process related to the Department's convening of the "Technical Work Group" to discuss modifications to the Fourth Methodology Order; and

ii. By setting the hearing without regard to the time required for discovery and without consideration of the existing obligations of the parties, their legal representatives, and consultants.

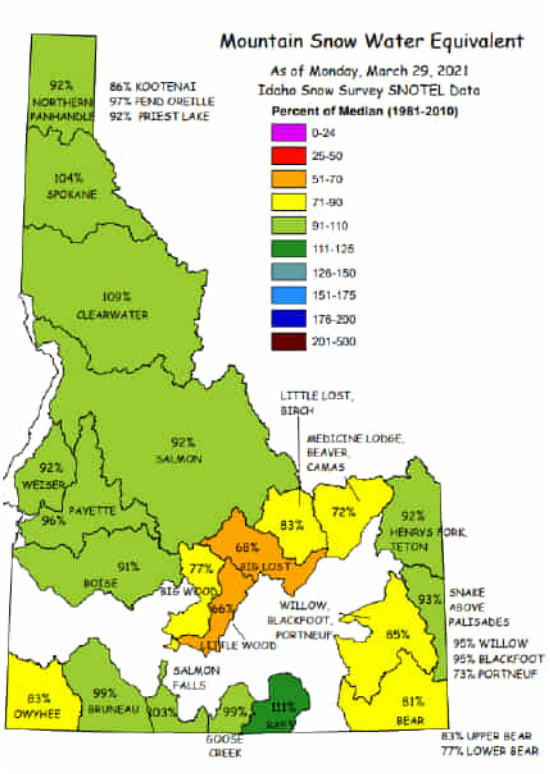
3. The allotted schedule leaves no time for necessary site investigations, let alone the ability for expert and lay witnesses to be deposed as to their opinions when it comes to water use and current practices. The original delivery call was filed eighteen (18) years ago in 2005 with various proceedings and an administrative hearing occurring in 2008. Water use, irrigation practices, and irrigated area have likely materially changed in the intervening fifteen (15) years since the hearing. If IDWR is using the "best available science" to administer junior-priority water rights, juniors, who have due process rights in delivery calls, must be afforded the same opportunity to use the best available science to evaluate the SWC's current water use.

4. Evaluation of the factual and legal issues that the Director has addressed in the *Methodology Order* and *As-Applied Order* will be complex and require significantly more time from the Cities' attorneys, consultants, and expert witnesses than has been allotted.

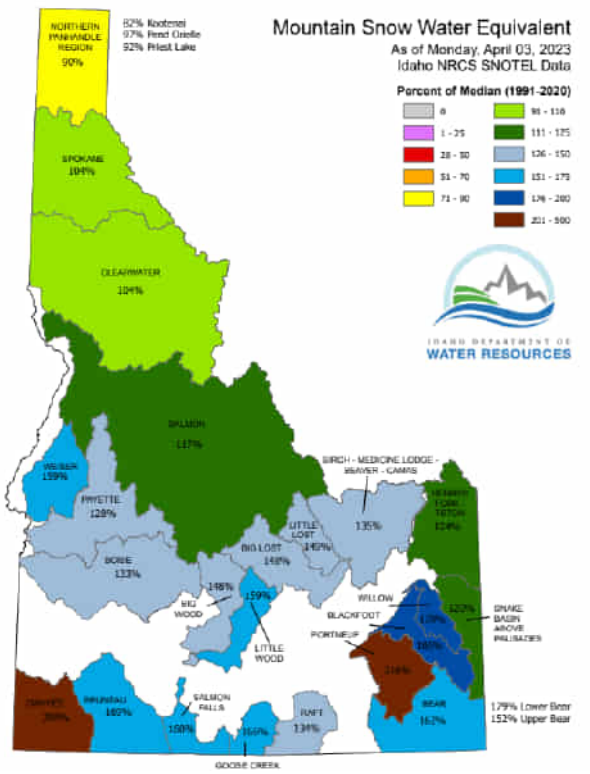
5. In prior delivery call hearings, the Director has asked for preparation of staff memoranda. If staff memoranda are prepared, those documents will need to be evaluated in an already compressed time period. With the likelihood that parties will request interviews or depositions of the authors of the staff memoranda and the likely need for expert rebuttal reports to the memoranda and to the expert reports of other parties, the time provided is grossly inadequate.

6. The need for the Director to resolve the Cities' *Motion to Appoint an Independent Hearing Officer*.

7. The Coalition of Cities' attorney, Candice M. McHugh, is unavailable during the dates set for hearing because of a previously scheduled out of state obligation, leaving the Coalition of Cities' other attorney, Chris M. Bromley, as the sole attorney representing



the client and running the office.



8. Mr. Bromley, as well as other counsel who represent parties in this matter, is set to argue before the Idaho Supreme Court on June 5, 2023 in the Department's appeal of the 2021 curtailment in Basin 37, *South Valley Ground Water Dist. v. Idaho Dept. of Water Res.*, Docket No. 49632. Mr. Bromley has a duty to another client in the appeal that will require his full attention in the week leading up to the argument and will be unable to provide the focus that is required to adequately represent the Coalition of Cities with Ms. McHugh's absence. Additionally, Mr. Bromley is scheduled to be out of the country on a previously planned trip with his family for most of the month of July.

9. Greg Sullivan, expert consultant for the Cities, is scheduled to be out of the country from May 17, 2023 through June 3, 2023 and will be unavailable to consult with the Cities' attorneys to assist in developing strategy, prepare expert reports, prepare exhibits, and to attend depositions if the schedule even allows for depositions to occur.

Based on the foregoing, the abbreviated hearing schedule leaves no time for discovery, fact finding, and the ability for the Cities' attorneys and experts to adequately represent their clients' interests.

A continuance is further warranted because, unlike in the Basin 37 delivery call that is referenced above, a "drought is [not] predicted for the 202[3] irrigation season . . . ." *Notice of Administrative Proceeding, Pre-Hearing Conference, and Hearing* at 1 (May 4, 2021). Indeed, "The Joint Forecast predicts an unregulated inflow of 3,700,000 acre-feet at the Snake River near Heise gage for the period of April through July. The forecasted flow volume equates to 112% of average." *As-Applied Order* at 5. The water supply in eastern Idaho is self-evident when looking at IDWR's snow water equivalency map for the spring of 2021 that was used to predict the drought in Basin 37 and comparing it with the same map for the spring of 2023, as shown on the follow page:

https://idwr.idaho.gov/water-data/water-supply/snow-water-equivalency/

In the Basin 37 delivery call, the Director stated he had to act with exigency because of a historically poor water supply and because he lacked a framework for determining material injury to senior-priority surface water rights. Here, material injury has already been determined in the current *Methodology Order* and those that preceded it, allowing the Director to administer water rights. Additionally, many of the junior-priority ground water users who pump from the Eastern Snake Plain Aquifer ("ESPA") are allowed to do so based on previously approved CM Rule 43 mitigation plans. On April 24, 2023, the Director issued an order in the companion matter, CM-MP-2016-001, related to IGWA's obligations for 2023; these obligations are also referenced in footnote 5 of the Final Order Regarding April 2023 Forecast Supply Methodology Steps 1-3. The ESPA Cities, of which the Cities are part, is one group that is allowed to pump in the 2023 irrigation season because they are in compliance with their mitigation plan. *As-Applied Order* at 5, fn. 5. Therefore, the

Director has all of the tools at his disposal to administer junior-priority ground water rights for the benefit of senior-priority surface water rights, with mitigation plans in place to address material injury, and no exigency to warrant a complex, technical hearing in such a compressed schedule.

As explained by the Supreme Court, expediency in conjunctive administration is important, however, "It is vastly more important that the Director have the necessary pertinent information and the time to make a reasoned decision based on the available facts." *American Falls Res. Dist. No. 2 v. Idaho Dept. of Water Res.*, 143 Idaho 862, 875, 154 P.3d 433, 446 (2007) (emphasis added). Because there is no exigency, the schedule that the Director established does not allow time for the parties to present their information for consideration. Therefore, the Cities move to continue the hearing until a date in December 2023 or January 2024, which respects the schedules of the parties and will allow the Director sufficient time to evaluate the evidence and issue an order prior to the 2024 irrigation season.

Respectfully submitted this 28th day of April, 2023.

Attorney for McCain Foods USA, Inc.

BEFORE THE DEPARTMENT OF WATER RESOURCES

OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	**Docket No. CM-DC-2010-001** **MCCAIN FOODS USA, INC.'S REQUEST FOR HEARING AND OBJECTION**

REQUEST FOR HEARING

Pursuant to Idaho Code § 42-1701(A)(3), McCain Foods USA, Inc.'s ("McCain") requests a hearing on the Department's *Fifth Amended Methodology Order Regarding Methodology For Determining Material Injury to Reasonable In-Season Demand And Reasonable Carryover* and *Final Order Regarding April 2023 Forecast Supply* ("2023 As-Applied Order") both issued April 21, 2023. McCain objects to the *Fifth Amended Order* and the 2023 As-Applied Order's implementation this upcoming season for the reasons set forth below

which it also identifies as issues for hearing. McCain reserves the right to revise the issues as more information becomes available.

Among the issues the McCain has identified for hearing are:

a) IDWR's new reliance on transient modeling;

b) IDWR's failure to consider the Twin Falls Canal Company's increase in diversions over the last twenty years;

d) IDWR's failure to consider changes in the efficiency of the SWC's operations;

e) IDWR's failure to consider all sources of supply available to the SWC;

f) IDWR's use of 2018 as the new baseline year; and

g) IDWR's violation of McCain's due process rights by giving less than 10 business days to provide a mitigation solution after a wholesale change in methodology and in a non-drought year, by setting the hearing without regard to the time required for discovery and without consideration of the existing obligations of the parties, their legal representatives and consultants.

Attorneys for the Cities of Bliss, Burley, Carey, Declo, Dietrich, Gooding, Hazelton, Heyburn, Jerome, Paul, Richfield, Rupert, Shoshone, and Wendell

BEFORE THE DEPARTMENT OF WATER RESOURCES

OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	**Docket No. CM-DC-2010-001** **COALITION OF CITIES' AMENDED REQUEST FOR HEARING**

COME NOW, the Cities of Bliss, Burley, Carey, Declo, Dietrich, Gooding, Hazelton, Heyburn, Jerome, Paul, Richfield, Rupert, Shoshone, and Wendell ("Coalition of Cities"), by and through their attorneys of record, McHugh Bromley, PLLC and files this Request for Hearing in the above captioned matter.

REQUEST FOR HEARING

Pursuant to Idaho Code § 42-1701(A)(3), the Coalition of Cities requests a hearing on the Department's *Fifth Amended Methodology Order Regarding Methodology For Determining Material Injury to Reasonable In-Season Demand And Reasonable Carryover*, and *Final Order Regarding April 2023 Forecast Supply* ("2023 As-Applied Order") both issued April 21, 2023. Among the issues the Coalition of Cities has identified for hearing:

a) IDWR's new reliance on transient modeling;

b) IDWR's failure to properly identify the Surface Water Coalition's ("SWC") irrigated acreage used in the determination of reasonable in-season demand;

c) IDWR's failure to consider the Twin Falls Canal Company's increase in diversions over the last twenty years;

d) IDWR's failure to consider changes in the efficiency of the SWC's operations;

e) IDWR's failure to consider all sources of supply available to the SWC;

f) IDWR's use of 2018 as the new baseline year;

g) IDWR's failure to apply Conjunctive Management Rule 20.03 and principles of reasonableness generally; and

h) IDWR's violation of due process rights of all interested water users by:

i) by engaging in an apparently sham public process related to the Department's convening of the "Technical Work Group" to discuss modifications to the Fourth Methodology Order and then largely ignoring that group's recommendations; and

ii) by a continued abuse of process, authority and power in setting the hearing without regard to the time required for discovery and without consideration of the existing

obligations of the parties, their legal representatives and consultants and reflecting bias against junior water right uses.

ATTORNEYS FOR THE CITY OF POCATELLO

BEFORE THE DEPARTMENT OF WATER RESOURCES

OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	**Docket No. CM-DC-2010-001** **POCATELLO'S REQUEST FOR HEARING**

COMES NOW the City of Pocatello (Pocatello), by and through its attorneys of record, Somach Simmons & Dunn, to request a hearing in the captioned matter and to seek an order authorizing discovery. As reflected in the contemporaneously filed Motion for Continuance, Pocatello joins in the request to delay the trial in this matter currently set for June 2-6, 2023.

A. Request for Hearing

Pursuant to Idaho Code § 42-1701(A)(3), Pocatello requests a hearing on the Department's *Fifth Amended Methodology Order Regarding Methodology For Determining Material Injury to Reasonable In-Season Demand And Reasonable Carryover*, issued

April 21, 2023 ("Fifth Methodology Order"). Among the issues Pocatello has identified for hearing:

a) Whether changes to how IDWR computes curtailment dates (using transient groundwater modeling) are reasonable;

b) Whether the ESPAM has been shown to be sufficiently accurate to support the proposed transient groundwater modeling to determine curtailment dates;

c) Whether the Surface Water Coalition's ("SWC") actual irrigated acreage was properly determined for use in determining reasonable in-season demand;

d) Whether a baseline demand that incorporates increases in SWC member diversions in recent years is valid basis for conjunctive administration;

e) The reasonableness of Project efficiencies of the SWC members, trends in said efficiencies in recent years, and how the efficiency values are used in determining reasonable in-season demands;

f) IDWR's failure to consider all sources of supply to the SWC;

g) Whether 2018 is a reasonable new baseline year;

h) Whether changes to determination of the reasonable in-season demand for the SWC members are reasonable and appropriate;

i) Whether the level of conservatism employed in the methodology order is reasonable;

j) Whether contingencies other than curtailment are available to protect senior-priority rights in the event that mitigation water becomes unavailable.

k) Whether changes to how the reasonable carryover for the SWC members is computed are reasonable;

l) Whether other analytical methods or modeling would reasonably improve the process for predicting and evaluating material injury;

m) IDWR's failure to apply Conjunctive Management Rule 20.03 (IDAPA 37.03.11.20.03) and principles of reasonableness generally;

n) IDWR's violation of due process rights of all interested water users:

i. by engaging in an ineffective public process related to the Department's convening of the "Technical Work Group" to discuss modifications to the Fourth Methodology Order;

ii. by setting the hearing without regard to the time required for discovery and without consideration of the existing obligations of the parties, their legal representatives and consultants.

Respectfully submitted this 28th day of April 2023.

SOMACH SIMMONS & DUNN

By_____
Sarah A. Klahn, ISB # 7928

Governor Brad Little

Director Gary Spackman

May 1, 2023

RE: Notice of Possible Curtailment of Ground Water Rights with Priority Dates Junior to December 30, 1953 - Surface Water Coalition Delivery Call

Dear Water Right Holder,

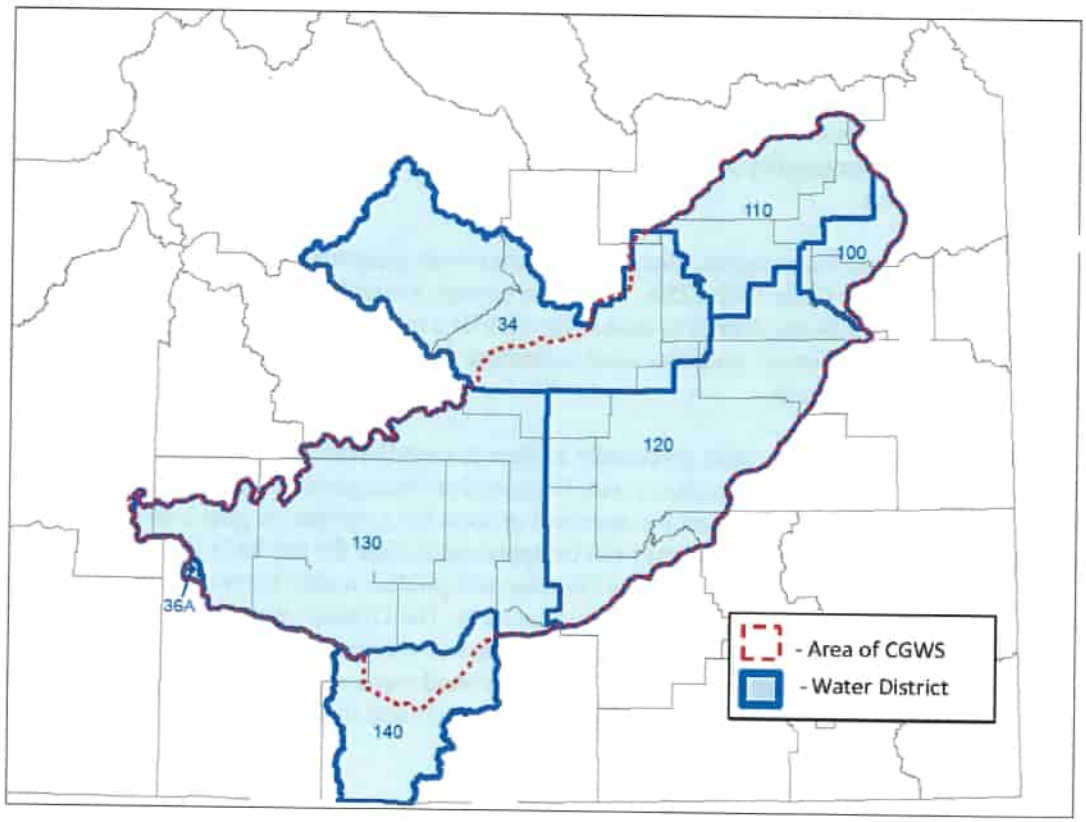
You are receiving this letter because, according to the records of the Idaho Department of Water Resources ("Department"), you are the holder of one or more water rights authorizing diversion of ground water from the Eastern Snake Plain Aquifer Area of Common Ground Water Supply ("ESPA") that are not covered by an approved and effectively operating mitigation plan. Because your water right(s) are not currently covered by an approved and effectively operating mitigation plan, **your water right(s) *may* be subject to curtailment this 2023 irrigation season.**

On April 21, 2023, the Director of the Department issued the *Final Order Regarding April 2023 Forecast Supply (Methodology Steps 1-3)* ("As-Applied Order"). The As-Applied Order predicts a shortfall in the water supply for senior priority Snake River water rights during the 2023 irrigation season, which will result in mitigation requirements or curtailment for ground water rights with priority dates junior to (later than) **December 30, 1953**.

The Department scheduled a hearing for the parties to the As-Applied Order on **June 6–10, 2023.** After the hearing the Director will decide whether to issue a curtailment order. If the Director issues a curtailment order, ground water rights junior to December 30, 1953, could be subject to curtailment unless the holders of junior priority ground water rights mitigate for ground water diverted pursuant to an approved mitigation plan.

Holders of ground water rights affected by a curtailment order may participate in an approved mitigation plan. See Idaho Code § 42-5259. If you are already a member of a ground water district, please contact and work with the district to ensure the district's records are up to date. If you are not a member of a ground water district, you may want to contact the nearest ground water district to inquire if the district will allow you to join.

Holders of ground water rights potentially subject to curtailment may also submit a proposed mitigation plan to the Director in accordance with Conjunctive Management Rule 43.[1] See IDAPA 37.03.11.043. However, please be aware the approval process for a mitigation plan is time-consuming. A proposed mitigation plan submitted now may not be approved in time for the 2023 irrigation season. Upon receipt of a proposed mitigation plan, the Director will publish notice for two successive weeks, after which ten days will be allowed for the filing of protests. The Director may hold a hearing if necessary to determine whether a proposed mitigation plan will mitigate injury to the SWC caused by diversions of ground water authorized by junior priority ground water rights. If the proposed mitigation plan is protested, the Director will hold a hearing. Please be advised that a curtailment order is not stayed pending evaluation of a mitigation plan.



[1] For example, a copy of the proposed mitigation plan submitted by the SWC & IGWA can be found here: https://idwr.idaho.gov/wp-content/uploads/sites/2/legal/CM-MP-2016-001/CM-MP-2016-001-20160309-SWCs-and-IGWAs-Stipulated-Mitigation-Plan-and-Request-for-Order.pdf

Information regarding the ongoing status of this matter may be found under the Current Topics section of the Department's website at: https://idwr.idaho.gov/ If you have questions concerning this notice, please contact the Department's State Office in Boise at 208-287-4800, or the water district watermaster in your area who regulates ground water within the ESPA and copied below. Water district boundaries can be found on the web at https://idwr.idaho.gov/water-rights/water-districts/map/, and Watermaster contact information can be found on the web at https://research.idwr.idaho.gov/files/ExternalReports/wdcontactsrpt.pdf

Respectfully,

GARY SPACKMAN
Director

BEFORE THE DEPARTMENT OF WATER RESOURCES

OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **SCHEDULING ORDER AND ORDER AUTHORIZING REMOTE APPEARANCE AT HEARING**

BACKGROUND

On April 21, 2023, the Director of the Idaho Department of Water Resources ("Department") issued his *Fifth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* ("Methodology Order") as well as his *Final Order Regarding April 2023 Forecast Supply* ("As-Applied Order"). The Methodology Order revises the nine steps used to determine material injury to members of the Surface Water Coalition ("SWC"). The As-Applied Order predicts a shortfall for the 2023 irrigation season, which will result in mitigation requirements or curtailment for ground water rights with priority dates junior to December 30, 1953.

The Director, anticipating that one or more parties would request a hearing pursuant to Idaho Code § 42-1701A(3) in response to one or both of the orders, issued a *Notice of Hearing, Notice of Prehearing Conference, and Order Authorizing Discovery* ("Notice of Hearing") on April 21, 2023. In addition to scheduling an in-person hearing on the Methodology Order and As-Applied Order for June 6–10, 2023, the Notice of Hearing authorized the parties to begin conducting discovery immediately and scheduled a prehearing conference, which the Director held on April 28, 2023.

During the prehearing conference, the Director identified two Department witnesses who will be made available to the parties for deposition and will testify at the hearing—Jennifer Sukow, Engineer, Technical 2, and Matthew Anders, Technical Services Bureau Chief. The Director stated he did not intend to request a technical staff memorandum in advance of the hearing. Some counsel expressed concern about having enough time to respond to discovery given the compressed period for the hearing. The Director agreed to limit the scope and timing of discovery to address the concerns. Counsel for the Coalition of Cities[1] and McCain Foods USA, Inc., Candice McHugh, notified the Director of an out-of-state conflict with the hearing dates and requested that the Director allow her to formally appear virtually instead of in-person on June 6–10, 2023. No parties objected to attorney McHugh's remote participation request

[1] In this matter, the Coalition of Cities refers to the Idaho cities of Bliss, Burley, Carey, Declo, Dietrich, Gooding, Hazelton, Heyburn, Jerome, Paul, Richfield, Rupert, Shoshone, and Wendell.

during the prehearing. Further, the Director and the parties discussed and agreed upon a discovery and hearing schedule. The order below memorializes the various schedules and deadlines articulated during the prehearing conference on April 28, 2023.

ORDER

IT IS HEREBY ORDERED that discovery will be limited as follows: (1) The parties shall not engage in interrogatories or requests for admissions; (2) The parties may request production of documents. The party upon whom a request for production of documents is served shall respond to the request within 10 days from the date the request is served.

IT IS FURTHER ORDERED that the following schedule is ADOPTED:

May 5, 2023	1) Deadline for the Department to identify materials Ms. Sukow and Mr. Anders may rely upon at the hearing. 2) Deadline for the Department to summarize topics Ms. Sukow and Mr. Anders will testify about at the hearing. 3) Deadline for the parties to submit to the Department a written statement of proposed issues for the hearing.
May 10, 2023	Deadline for the Department to augment its above-mentioned list of materials Ms. Sukow and Mr. Anders may rely on at the hearing, if needed.
7 Days Prior to Hearing Day 1[2]	1) Deadline for the parties to complete all discovery. 2) Deadline for the parties to deliver copies of their expert reports to the other parties. 3) Deadline for the parties to exchange and file with the Department their proposed lay and expert witness lists. The parties should include a general summary of each witness' anticipated testimony.

[2] During the hearing one of the parties astutely suggested that the discovery deadline should be pinned to the hearing date, rather than an agreed upon calendar date, in the event the hearing date was moved.

4) Deadline for the parties to exchange and file with the Department their proposed exhibit lists. The parties shall also exchange and submit to the Department an electronic copy (via e-file email, USB thumb drive, or disc(s)) of their pre-marked exhibits using the following reserved exhibit numbers:

Exhibit Numbers	Assigned Party
1–99	Surface Water Coalition
100–199	Idaho Ground Water Appropriators
200–299	Coalition of Cities
300–399	City of Pocatello
400–499	City of Idaho Falls
500–599	Bonneville-Jefferson Ground Water District
600–699	McCain Foods USA, Inc.

Any future parties who have yet to appear and wish to submit exhibits at the hearing shall request a set of designated exhibit numbers from the Department by emailing sarah.tschohl@idwr.idaho.gov at least two business days prior to this deadline.

Hearing Day 1 Prior to the start of the hearing, the parties shall submit to the Department three physical copies of their pre-marked and numbered, proposed hearing exhibits.

IT IS FURTHER ORDERED that in accordance with IDAPA 37.01.01.552 and for good cause shown, counsel for the Coalition of Cities and McCain Foods USA, Inc., Candice McHugh, may appear virtually by video link on June 6–10, 2023. Sarah Tschohl, on behalf of the Department, will email the remote participation link to Candice McHugh no later than May 30, 2023.

DATED this 2nd day of May 2023.

Gary Spackman
Director

STATE OF IDAHO

DEPARTMENT OF WATER RESOURCES

IN THE MATTER OF THE DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY AND FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **IGWA's Petition for Reconsideration and Request for Hearing**

Idaho Ground Water Appropriators, Inc. ("IGWA"), acting for and on behalf of North Snake Ground Water District, Magic Valley Ground Water District, Carey Valley Ground Water District, Aberdeen-American Falls Area Ground Water District, Jefferson-Clark Ground Water District, Madison Ground Water District, and Henry's Fork Ground Water District, submit this Petition for Reconsideration and Request for Hearing pursuant to Idaho Code § 42-1701(A)(3), Idaho Code § 67-5246(4), and Rule 740.02.b. of the Rules of Procedure of the Idaho Department of Water Resources, requesting a hearing on the Department's *Fifth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* ("Fifth Methodology Order") and *Final Order Regarding April 2023 Forecast Supply* ("April 2023 As-Applied Order") issued April 21, 2023.

IGWA has not completed a thorough review of the Fifth Methodology Order or the April 2023 As-Applied Order, but preliminarily IGWA wishes to address the issues identified *Coalitions of Cities' Amended Request for Hearing* and *Pocatello's Request for Hearing* filed April 28, 2023. IGWA reserves the right to identify additional ground for contesting the Director's action once it completes a thorough review of the Fifth Methodology Order and the As-Applied Order.

Attorney for Amalgamated Sugar Company

BEFORE THE DEPARTMENT OF WATER RESOURCES

OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	**Docket No. CM-DC-2010-001** **AMALGAMATED SUGAR COMPANY'S REQUEST FOR HEARING, OBJECTION, IDENTIFICATION OF ISSUES AND NOTICE OF MITIGATION**

REQUEST FOR HEARING

Pursuant to Idaho Code § 42-1701(A)(3), Amalgamated Sugar Company ("Amalgamated") through its undersigned attorney, requests a hearing on the Department's *Fifth Amended Methodology Order Regarding Methodology For Determining Material Injury to Reasonable In-Season Demand And Reasonable Carryover* and *Final Order Regarding April 2023 Forecast Supply* ("2023 As-Applied Order") both issued April 21, 2023.

OBJECTION TO ORDER

Amalgamated objects to the *Fifth Amended Order* and the 2023 As-Applied Order's implementation this upcoming season for the reasons set forth below which it also identifies as issues for hearing. Amalgamated reserves the right to revise the issues as more information becomes available.

STATEMENT OF ISSUES FOR HEARING

Among the issues the Amalgamated has identified for hearing are:

a) IDWR's new reliance on transient modeling;

b) IDWR's failure to consider the Twin Falls Canal Company's increase in diversions over the last twenty years;

d) IDWR's failure to consider changes in the efficiency of the SWC's operations;

e) IDWR's failure to consider all sources of supply available to the SWC;

f) IDWR's use of 2018 as the new baseline year; and

g) IDWR's violation of Amalgamated's due process rights by not providing it actual notice of the order and requisite deadlines, and even if it was deemed that it was given "notice" because it shared an attorney with the Coalition of Cities, by giving it less than 10 business days to provide a mitigation solution after a wholesale change in methodology, by depriving it of the ability to develop its own mitigation plan to protect its water rights, by requiring compliance with a deadline to avoid curtailment without actual notice of the deadline and in a non-drought year, by setting the hearing without regard to the time required for discovery and without consideration of the existing obligations of the parties, their legal representatives and consultants.

NOTICE OF MITIGATION

Pursuant to the *Final Order Regarding April 2023 Forecast Supply* ("2023 As-Applied Order") issued April 21, 2023 demand that:

> On or before May 5, 2023, ground water users holding consumptive water rights bearing priority dates junior to December 30, 1953, within the Eastern Snake Plain Aquifer area of common ground water supply shall establish, to the satisfaction of the Director, that they can mitigate for their proportionate share of the predicted DS of 75,200 acre-feet in accordance with an approved mitigation plan.

Amalgamated submits this *Notice of Mitigation*. Amalgamated owns and uses water rights junior to the December 30, 1953, date. On Tuesday, May 2, 2023 Amalgamated petitioned Magic Valley Ground Water District ("MVGWD") to become a member of MVGWD and to be covered by its approved mitigation plan. Counsel for Amalgamated was informed by the Chairman of MVGWD, Dean Stevenson, that the letter had been received, that he had spoken to the board members and that they will take up Amalgamated petition at its Tuesday, May 9, 2023 meeting. Chairman Stevenson also indicated to counsel for Amalgamated that he expected the petition to be approved on Tuesday and that MVGWD would send a letter to IDWR and Amalgamated' s counsel to that effect next week. Aff. of McHugh filed herewith.

Amalgamated requests an order, or some other applicable document, from IDWR that it has met the May 5, 2023 deadline and established to the "satisfaction of the Director, that they can mitigation for their proportionate share … with an approved mitigation plan" by becoming members of MVGWD.

Submitted this 4th day of May, 2023

MCHUGH IN SUPPORT OF NOTICE OF MITIGAITON**

I, Candice McHugh hereby declare and state as follows:

1. I am over the age of 18 and state the following based upon my own personal knowledge.
2. I am an attorney for Amalgamated Sugar Company ("Company") and represent the Company on its water rights and water right matters.
3. On Tuesday, May 2, 2023, I petitioned Magic Valley Ground Water District (MVGWD) on the Company's behalf to join MVGWD for mitigation of the Company's water rights located within Basin 36.

4. On Thursday, May 4, 2023, I spoke with Dean Stevenson, Chairman of the MVGWD. He indicated that the petition was received, that he spoke with all the board members and he expects the petition to be approved at the Tuesday, May 9, 2023 meeting. He indicated that I was authorized to express this to IDWR in order to allow the Company to meet the deadline set forth in the Dated this 4th, day of May, 2023. He also told me that MVGWD would inform IDWR of its decision next week.

I declare under penalty of perjury under the laws of the State of Idaho that the foregoing is true and correct.

DATED May 4, 2023

MCHUGH BROMLEY, PLLC

Candice M. McHugh
Attorney Amalgamated Sugar Company

Attorney for McCain Foods USA, Inc.

BEFORE THE DEPARTMENT OF WATER RESOURCES

OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	**Docket No. CM-DC-2010-001** **MCCAIN FOODS USA, INC.'S NOTICE OF MITIGATION**

REQUEST FOR HEARING

Pursuant to the *Final Order Regarding April 2023 Forecast Supply* ("2023 As-Applied Order") issued April 21, 2023 demand that:

> On or before May 5, 2023, ground water users holding consumptive water rights bearing priority dates junior to December 30, 1953, within the Eastern Snake Plain Aquifer area of common ground water supply shall establish, to the satisfaction of the Director, that they can mitigate for their proportionate share of the predicted DS of75,200 acre-feet in accordance with an approved mitigation plan.

McCain Foods USA, Inc., ("McCain") by and through its attorney of record, submits this *Notice of Mitigation*. McCain owns and uses water rights junior to the December 30, 1953,

date. On Tuesday, May 2, 2023 McCain petitioned Southwest Irrigation District ("SWID") to become a member of SWID and to be covered by its approved mitigation plan. Counsel for McCain was informed by letter on May 3, 2023, that McCain has been approved to join SWID as a member and that McCain will be covered under its mitigation plan. A copy of the letter is attached hereto as Exhibit A and incorporated herein. SWID also indicated that a letter was sent to IDWR informing IDWR of this fact.

McCain requests an order, or some other applicable document, from IDWR that it has established to the "satisfaction of the Director, that they can mitigation for their proportionate share … with an approved mitigation plan" by becoming members of SWID.

Submitted this 4th day of May, 2023

RE: Petition to Join Southwest Irrigation District for Mitigation

Dear Candice:

Pursuant to your request of May 2, 2023, the Board approved the mitigation for the following water rights:

WaterRight	Priority Date	Owner	CFS	Volume	Combined Limit	WaterUse	Condition
45-2747	3/15/1960	McCain Foods*	4.00	2062.80	-	Industrial	-
45-2748	3/6/1961	McCain Foods	0.60	309.40	-	Industrial	-
45-2758	3/15/1960	McCain Foods	2.08	1072.70	-	Commercial	-
45-13970	9/1/1957	McCain Foods	2.66	1371.80	-	Industrial	-
		Totals:	9.34	4816.70			

* McCain Foods USA Inc.

Southwest charges $900 per CFS per year billed in arrears.

It is the policy of Southwest Irrigation District to charge new participants in mitigation for the previous three years. In keeping with that procedure, the back fees for McCains would be $25,218.00. It may be paid over three years if necessary.

The 2023 assessment will be billed in the spring of 2024.

We have forwarded a letter to the Idaho Department of Water Resources indicating the

WAP/ar

approval of McCain Foods USA Inc. for mitigation.

I have sent a copy of this letter to you by email and I placed one in regular mail to your office.

Very truly yours,

PARSONS, LOVELAND, SHIRLEY & LINDSTROM, LLP

William A. Parsons

Attorneys for the City of Idaho Falls

BEFORE THE DEPARTMENT OF WATER RESOURCES
OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	**CITY OF IDAHO FALLS CHALLENGE AND REQUEST FOR HEARING**

The City of Idaho Falls ("Idaho Falls" or "City"), by and through its counsel, Holden, Kidwell, Hahn & Crapo, P.L.L.C., petitions for a hearing pursuant to Idaho Code § 42-1701A(3) in the above-captioned matter.

On Aril 21, 2023, the Director of the Idaho Department of Water Resources ("IDWR" or "Department") issued a *Fifth Amended Methodology Order Regarding Methodology for Determining material Injury to Reasonable In-Season Demand And Reasonable Carryover* (the "*Methodology Order*") and a *Final Order Regarding April 2023 Forecast Supply* ("*2023 As-Applied Order*"). The City objects to the *Methodology Order* and the *2023 As-Applied Order*, and

because the only relief allowed for in the *Methodology Order* and the *2023 As-Applied Order* is to contest this action by requesting a hearing, the City hereby requests a hearing in this matter pursuant to Idaho Code § 42-1701A(3). The City reserves the right to supplement this filing with a list of issues when so directed in this contested case.

Dated this 4th day of May, 2023.

Attorneys for Bonneville-Jefferson Ground Water District

STATE OF IDAHO

DEPARTMENT OF WATER RESOURCES

IN THE MATTER OF THE DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY AND FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **BONNEVILLE-JEFFERSON GROUND WATER DISTRICT'S REQUEST FOR HEARING**

The Bonneville-Jefferson Ground Water District (hereafter "Bonneville-Jefferson"), acting for and on behalf of its respective members, through counsel, submits this Request for Hearing pursuant to Idaho Code § 42-1701(A)(3), Idaho Code § 67-5246(4), and Rule 740.02.b. of the Rules of Procedure of the Idaho Department of Water Resources, requesting a hearing on the Department's *Fifth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* ("Fifth Methodology Order")

and *Final Order Regarding April 2023 Forecast Supply* ("April 2023 As-Applied Order") issued April 21, 2023.

Bonneville-Jefferson is in the process of reviewing the Fifth Methodology Order and the April 2023 As-Applied Order, but plans to address the issues identified in the Coalitions of Cities' *Amended Request for Hearing* and Pocatello's *Request for Hearing* filed April 28, 2023. In addition, Bonneville-Jefferson identifies the following issues for the hearing so far:

1) The procedures and process used by the Department in issuing the Methodology Order.
2) The technical rational for the Methodology Order.
3) The policy behind changing to transient state modeling in the Methodology Order.
4) The analysis and factual basis used in the Methodology Order.
5) The Department's new reliance on transient modeling.
6) The Department's failure to consider the Twin Falls Canal Company's increase in diversions over the last twenty years.
7) The Department's failure to consider changes in the efficiency of the SWC's operations.
8) The Department's failure to consider all sources of supply available to the SWC
9) The Department's rational and factual basis for using 2018 as the new baseline year.
10) The definition of futile call, including waste, reasonable time, and efficiency.
11) Whether the Methodology Order results in the optimum development of water resources in the public interest.
12) Whether the Methodology Order is contrary to the State's interest in securing the maximum use and benefit, and least wasteful use, of its water resources

13) Whether the Methodology Order permits SWC to command the entirety of large volumes of water in a surface or ground water source to support its appropriation contrary to the public policy of reasonable use of water as described in the Rules for Conjunctive Management of Surface and Ground Water Resources, IDAPA 37.03.11.

14) Whether the Department provided due process to water users in issuing the Methodology Order.

15) Bonneville-Jefferson reserves the right to present additional issues that may be revealed through the discovery process.

Bonneville-Jefferson reserves the right to identify additional ground for contesting the Director's action once it completes a thorough review of the Fifth Methodology Order and the As-Applied Order.

Respectfully submitted this the 4th day of May 2023.

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	**Docket No. CM-DC-2010-001** **JOINT NOTICE OF DEPOSITION DUCES TECUM OF JENNIFER SUKOW, P.E., P.G.**

TO: Jennifer Sukow and all counsel of record.

PLEASE TAKE NOTICE that on **May 10, 2023, from 8:00 a.m. – 3:30 p.m.**, counsel for the Cities of Bliss, Burley, Carey, Declo, Dietrich, Gooding, Hazelton, Heyburn, Jerome, Paul, Richfield, Rupert, Shoshone, and Wendell (collectively, the "Coalition"), City of Pocatello, City of Idaho Falls, Idaho Ground Water Appropriators, Inc. ("IGWA"), Bonneville-Jefferson Ground Water District, and Bingham Groundwater District in the above-entitled action will take the deposition of JENNIFER SUKOW, P.E., P.G., in accordance with the Order Authorizing Discovery issued April 21, 2023, in this matter, IDAPA 37.01.01.520.01.a and 37.01.01.520.02, and Idaho Rules of Civil Procedure 26, 30(a), and 34, and continue from day to day thereafter until completion, at the offices of the **Idaho Department of Water Resources, 322 E. Front Street, Boise, Idaho 83702**. The deposition will be "hybrid," with the witness, court reporter, and some attorneys present at the Idaho Department of Water Resources ("IDWR" or "Department"), and others present via the Zoom video platform, hosted by M&M Court Reporting. Participants will receive a Zoom link via email from M&M the day before the deposition.

DOCUMENTS REQUESTED

The words used in these requests for identification of documents for copying and inspection are to be interpreted according to their plain meanings. The following definitions are provided in the spirit of good faith and cooperation to assist the Responding Party in preparing responses to each of the following demands below.

A. "Announcement(s)" means any document or electronic communication that is not merely a publication or news release and that advises ground water users within the Eastern Snake Plain Aquifer of a particular action to be taken by IDWR.

B. "Document(s)" shall mean the original, all copies and drafts of papers and writings of every kind, description and form, whether handwritten or typed, and all mechanical, magnetic media and electronic recordings, records and data of every kind, description and form, and all photographs of every kind, and including, without limiting the generality of the foregoing, the following: correspondence, letters, notes, e-mails, computer files, memoranda, reports, notebooks, binders, drawings, studies, analyses, drafts, diaries, calendars, datebooks, appointment books, day-timers, intra- or inter-office communications, canceled checks, minutes, bulletins, circulars, pamphlets, telegrams, instructions, work assignments, messages (including reports, notes and memoranda of telephone conversations and conferences), telephone statements, calendar and diary entries, desk calendars, job or transaction files, books of account, ledgers, bank statements, promissory notes, invoices, charge slips, working papers, graphs, charts, lab books, lab notes, lab journals or notebooks, evaluation or appraisal reports, pleadings, transcripts of testimony or other documents filed or prepared in connection with any court or agency or other proceeding, deeds, mortgages, deeds of trust, contracts, agreements, assignments, instruments, charges, opinions, official statements, prospectuses, appraisals, feasibility studies, trusts, releases of claims, charters, certificates, licenses, leases, invoices, computer printouts or programs, summaries, audio, video or sound recordings, cassette tapes, video recorded, electronic or laser recorded, or photographed information. "Document(s)" are to be taken as including all attachments, enclosures and other documents that are attached to, relate to or refer to such documents.

C. "External Communications" include, but are not limited to, emails, text messages, letters, notes, phone calls, voicemails, and any voice and audio recordings between

IDWR employees, including, but not limited to managers, directors, or board members and persons that are not employed by the Department.

D. "Internal Communications" include, but are not limited to, emails, text messages, letters, notes, phone calls, voicemails, and any voice and audio recordings between IDWR employees, including, but not limited to managers, directors, or board members.

E. "Notice" means any publication or news release advising ground water users within the Eastern Snake Plain Aquifer of a particular action to be taken by IDWR.

The Deponent is required to produce the following to the deposition:

1. Any and all documents reflecting the Deponent's involvement in the issuance of the Fifth Amended Methodology Order.
2. Any and all documents the Deponent is aware of, whether or not authored by her, that reflect Department employees' input on the Department's decision to move from steady state to transient modeling in the Fifth Methodology Order.
3. Any memoranda or reports authored by the Deponent or others that report to her that describe the change in the number of water rights likely to be curtailed as a result of the Department's reliance on transient modeling in the Fifth Methodology Order.
4. All model files, including input files, output files, post-processing analyses, documentation, communications, and notes associated with the Eastern Snake Plain Aquifer Model ("ESPAM") transient curtailment run used to support the proposed December 10, 1953 curtailment date that were not already provided.
5. All model files, including input files, output files, post-processing analyses, documentation, communications, and notes associated with any and all

ESPAM transient curtailment runs used to evaluate curtailment dates other than the December 10, 1953 curtailment date.

6. All model files, including input files, output files, post-processing analyses, documentation, communications, and notes for any and all ESPAM steady-state curtailment runs used to evaluate potential curtailment dates for the 2023 Methodology Order.

7. Any and all documents relied upon by the Department to support the technical rationale for the original use of Steady State.

8. Any and all internal and external communications regarding or pertaining to the information provided pursuant to paragraph 1 above.

9. Any and all Department notices or announcements regarding the Department's transition from Steady State to Transient State.

10. Any and all internal and external communications pertaining to the information provided pursuant to paragraph 3 above.

11. Any and all documents pertaining to the Department's decision to transition from Steady State to Transient State.

12. Any and all internal and external communications pertaining to the information provided pursuant to paragraph 5 above.

13. Any and all documents and electronic or recorded communications or discussions pertaining to credits for accruals to non-target reaches and non-target time periods.

14. Any and all internal and external communications regarding or pertaining to the information provided pursuant to paragraph 7 above.

15. Any and all documents pertaining to modeling stress file for the model run that produced the 1953 curtailment date in the *April 2023 As-applied Order* issued on April 21, 2023, in a format readable by ESRI software, a text reader, or a spreadsheet program (e.g., a Well File from Item C on page 7 of the IWRRI curtailment scenario).

16. Any and all internal and external electronic or recorded communications regarding or pertaining to the information provided pursuant to paragraph 9 above.

17. All documents, analyses, reports, data, and other materials evaluated, examined, or developed in connection with, or related to, model uncertainty, the futile call doctrine, or implementation of a trim line.

18. All model files, including input files, output files, post-processing analyses, documentation, communications, and notes for any model evaluation applying the transient modeling as a hindcast to previous years to 2023 where the Methodology Order applied.

19. All documents, analyses, reports, data, and other materials evaluated, examined, or developed in connection with, or related to, the differences between the ESPAM2.1 and ESPAM2.2 curtailment scenarios.

20. All documents, analyses, reports, data, and other materials evaluated, examined, or developed in connection with, or related to, the differences between the modeled project efficiencies for SWC irritation entities in ESPAM2.1 and ESPAM2.2.

21. All documents, analyses, reports, data, and other materials evaluated, examined, or developed in connection with, or related to, the Department's determination and reasoning to use steady state modeling in the previous as applied orders.

22. Any and all internal and external electronic or recorded communications regarding or pertaining to the information provided pursuant to paragraph 18 above.

23. Any and all internal and external electronic or recorded communications regarding or pertaining to the information provided pursuant to paragraph 19 above.

24. Any and all internal and external electronic or recorded communications regarding or pertaining to the information provided pursuant to paragraph 20 above.

25. Any and all internal and external electronic or recorded communications regarding or pertaining to the information provided pursuant to paragraph 21 above.

BEFORE THE DEPARTMENT OF WATER RESOURCES

OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	**Docket No. CM-DC-2010-001** **JOINT NOTICE OF DEPOSITION DUCES TECUM OF MATTHEW ANDERS, P.G.**

TO: Matthew Anders and all counsel of record.

PLEASE TAKE NOTICE that on **May 12, 2023, from 9:00 a.m. – 5:00 p.m.**, counsel for the Cities of Bliss, Burley, Carey, Declo, Dietrich, Gooding, Hazelton, Heyburn, Jerome, Paul, Richfield, Rupert, Shoshone, and Wendell (collectively, the "Coalition"), City of Pocatello, City of Idaho Falls, Idaho Ground Water Appropriators, Inc. ("IGWA"), Bonneville-Jefferson Ground Water District, and Bingham Groundwater District in the above-entitled action will take the deposition of MATTHEW ANDERS, P.E., in accordance with the Order Authorizing Discovery issued April 21, 2023, in this matter, IDAPA 37.01.01.520.01.a and 37.01.01.520.02, and Idaho Rules of Civil Procedure 26, 30(a), and 34, and continue from day to day thereafter until completion, at the offices of the **Idaho Department of Water Resources, 322 E. Front Street, Boise, Idaho 83702**. This deposition will be "hybrid", with the witness, court reporter, and some attorneys present at the Idaho Department of Water Resources ("IDWR" or "Department"), and others present via the Zoom video platform, hosted by M&M Court Reporting. Participants will receive a Zoom link via email from M&M the day before the deposition.

DOCUMENTS REQUESTED

The words used in these requests for identification of documents for copying and inspection are to be interpreted according to their plain meanings. The following definitions are provided in the spirit of good faith and cooperation to assist the Responding Party in preparing responses to each of the following demands below.

A. "Announcement(s)" means any document or electronic communication that is not merely a publication or news release and that advise ground water users within the Eastern Snake Plain Aquifer of a particular action to be taken by IDWR.

B. "Document(s)" shall mean the original, all copies and drafts of papers and writings of every kind, description and form, whether handwritten or typed, and all mechanical, magnetic media and electronic recordings, records and data of every kind, description and form, and all photographs of every kind, and including, without limiting the generality of the foregoing, the following: correspondence, letters, notes, e-mails, computer files, memoranda, reports, notebooks, binders, drawings, studies, analyses, drafts, diaries, calendars, datebooks, appointment books, day-timers, intra- or inter-office communications, canceled checks, minutes, bulletins, circulars, pamphlets, telegrams, instructions, work assignments, messages (including reports, notes and memoranda of telephone conversations and conferences), telephone statements, calendar and diary entries, desk calendars, job or transaction files, books of account, ledgers, bank statements, promissory notes, invoices, charge slips, working papers, graphs, charts, lab books, lab notes, lab journals or notebooks, evaluation or appraisal reports, pleadings, transcripts of testimony or other documents filed or prepared in connection with any court or agency or other proceeding, deeds, mortgages, deeds of trust, contracts, agreements, assignments, instruments, charges, opinions, official statements, prospectuses, appraisals, feasibility studies, trusts, releases of claims, charters, certificates, licenses, leases, invoices, computer printouts or programs, summaries, audio, video or sound recordings, cassette tapes, video recorded, electronic or laser recorded, or photographed information. "Document(s)" are to be taken as including all attachments, enclosures and other documents that are attached to, relate to or refer to such documents.

C. "External Communications" include, but are not limited to, emails, text messages, letters, notes, phone calls, voicemails, and any voice and audio recordings between

IDWR employees, including, but not limited to managers, directors, or board members and persons that are not employed by the Department.

D. "Internal Communications" include, but are not limited to, emails, text messages, letters, notes, phone calls, voicemails, and any voice and audio recordings between IDWR employees, including, but not limited to managers, directors, or board members.

E. "Notice" means any publication or news release advising ground water users within the Eastern Snake Plain Aquifer of a particular action to be taken by IDWR.

The Deponent is required to produce the following to the deposition:

1. All documents, memoranda, reports, analyses or notes relied on by the Department to prepare the December 23, 2022 *Summary of Recommended Technical Revisions to the 4th Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover for the Surface Water Coalition*.
2. All documents, memoranda, reports, analyses or notes related to the Department's decision to exclude from the Fifth Methodology Order:
    a. Near Real Time METRIC for determining Crop Water Need;
    b. April and July Regressions used to predict natural flow water supply.
3. All documents, memoranda, reports, analyses or notes related to the Department's decision to *include* in the Fifth Methodology Order:
    a. Transient modeling simulations for determining curtailment priority dates.
4. All documents, memoranda, reports, analyses, or notes related to the Department's review of information submitted by Greg Sullivan and/or Spronk

Water Engineers to IDWR and the Methodology Technical Work Group ("TWG") on December 12, 2022, December 21, 2022, and January 16, 2023, on behalf of the Eastern Snake Plain Aquifer ("ESPA") Cities.

5. All documents, memoranda, reports, analyses, or notes related to the Department's review of information submitted by Sophia Sigstedt to IDWR on January 16, 2023, on behalf of IGWA.

6. All documents, memoranda, reports, analyses or notes related to analyses of other potential Baseline Year(s) for use in the Fifth Methodology Order other than the 2018 BLY that was selected.

7. All documents, memoranda, reports, analyses, or notes related to the authorized and actual irrigated area of the Surface Water Coalition ("SWC") members.

8. All documents, memoranda, reports, analyses, or notes related to SWC member groundwater pumping and other sources of water available to the SWC members.

9. All documents, memoranda, reports, analyses, or notes related to the analysis of reasonable carryover for the SWC members.

10. All materials presented at the technical meetings, and all analyses, reports, data sets, and other materials evaluated, examined, or developed in connection therewith.

11. All documents, memoranda, reports, analyses or notes related to any analysis of an average of multiple years for consideration on the Base Line Year(s) and associated hindcast in the Base Line Year(s) shortfall.

12. All court filings that discuss, review, analyze, or identify areas of the methodology that require further technical analysis.

13. All documents, memoranda, reports, analyses or notes related to any analysis in the intervening years from the 2015 TWG to the 2022 TWG related to the Fifth Methodology Order.

14. All documents, analyses, reports, data, and other materials evaluated, examined, or developed in connection with, or related to, the Department's determination and reasoning to use steady state modeling in the previous as applied orders.

ATTORNEYS FOR THE CITY OF POCATELLO

BEFORE THE DEPARTMENT OF WATER RESOURCES

OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	**Docket No. CM-DC-2010-001** **POCATELLO'S STATEMENT OF ISSUES**

Pursuant to the Director's May 2, 2023 Scheduling Order in the captioned matter,,the City of Pocatello (Pocatello), by and through its attorneys of record, Somach Simmons & Dunn, hereby submits this Statement of Issues:.

a) Whether changes to how IDWR computes curtailment dates (using transient groundwater modeling) are reasonable;

b) Whether the ESPAM has been shown to be sufficiently accurate to support the proposed transient groundwater modeling to determine curtailment dates;

c) Whether the Surface Water Coalition's ("SWC") actual irrigated acreage was properly determined for use in determining reasonable in-season demand;

d) Whether a baseline demand that incorporates increases in SWC member diversions in recent years is valid basis for conjunctive administration;

e) The reasonableness of Project efficiencies of the SWC members, trends in said efficiencies in recent years, and how the efficiency values are used in determining reasonable in-season demands;

f) IDWR's failure to consider all sources of supply to the SWC;

g) Whether 2018 is a reasonable new baseline year;

h) Whether changes to determination of the reasonable in-season demand for the SWC members are reasonable and appropriate;

i) Whether the level of conservatism employed in the methodology order is reasonable;

j) Whether contingencies other than curtailment are available to protect senior-priority rights in the event that mitigation water becomes unavailable.

k) Whether changes to how the reasonable carryover for the SWC members is computed are reasonable;

l) Whether other analytical methods or modeling would reasonably improve the process for predicting and evaluating material injury;

m) IDWR's failure to apply Conjunctive Management Rule 20.03 (IDAPA 37.03.11.20.03) and principles of reasonableness generally;

n) IDWR's violation of due process rights of all interested water users:

i. by engaging in an ineffective public process related to the Department's convening of the "Technical Work Group" to discuss modifications to the Fourth Methodology Order;

ii. by setting the hearing without regard to the time required for discovery and without consideration of the existing obligations of the parties, their legal representatives and consultants.

This Statement of Issues is based on Pocatello's current understanding of the issues. Additional issues development of the facts and issues in this case, and additional issues may be identified as discovery and case development proceed.

Respectfully submitted this 4th day of May, 2023.

Attorneys for the Cities of Bliss, Burley, Carey, Declo, Dietrich, Gooding, Hazelton, Heyburn, Jerome, Paul, Richfield, Rupert, Shoshone, and Wendell

BEFORE THE DEPARTMENT OF WATER RESOURCES

OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	**Docket No. CM-DC-2010-001** **COALITION OF CITIES' STATEMENT OF ISSUES**

COME NOW, the Cities of Bliss, Burley, Carey, Declo, Dietrich, Gooding, Hazelton, Heyburn, Jerome, Paul, Richfield, Rupert, Shoshone, and Wendell ("Coalition of Cities"), by and through their attorneys of record, Candice M. McHugh and Chris M. Bromley, and pursuant to the Director's May 2, 2023, *Scheduling Order and Order Authorizing Remote Appearance at Hearing*, files this Statement of Issues in the above captioned matter.

Based on what is known now, and without the benefit of discovery, including the ability to conduct depositions, the Coalition of Cities identify the following issues for the hearing:

1. IDWR's new reliance on transient modeling;
2. IDWR's failure to properly identify the Surface Water Coalition's ("SWC") actual irrigated acreage used in the determination of reasonable in-season demand;
3. IDWR's failure to properly consider the SWC's changes in diversions over the last twenty years;
4. IDWR's failure to consider changes and reasonableness of the project efficiencies of the SWC's operations;
5. IDWR's failure to consider all sources of supply available to the SWC;
6. IDWR's use of 2018 as the new baseline year;
7. IDWR's failure to fully evaluate potential changes to the methodology used to determine the crop water needs of the SWC members;
8. IDWR's failure to fully evaluate potential changes to the methodology for forecasting the irrigation supplies of the SWC members;
9. IDWR's failure to fully evaluate changes to the methodology for determining reasonable carryover for the SWC members;
10. IDWR's failure to fully evaluate changes to the timing and procedures for updating the forecast shortages to the SWC members after the initial determination in April;

11. IDWR's failure to investigate whether the SWC members are using the water they divert efficiently and without waste, and in compliance with the terms of their decreed water rights;

12. IDWR's failure to standardize and make transparent the procedures for updating the SWC Methodology;

13. IDWR's failure to consider the comments received from members of the SWC Technical Working Group;

14. IDWR's failure to apply all factors in the Department's Rules for Conjunctive Management of Surface and Ground Water Resources, IDAPA 37.03.11, including but not limited to CM Rule 20.03 and principles of reasonableness generally; and

15. IDWR's violation of due process rights of all interested water users by:

a. by engaging in an apparently sham public process related to the Department's convening of the "Technical Work Group" to discuss modifications to the Fourth Methodology Order and then largely ignoring that group's recommendations; and

b. by a continued abuse of process, authority and power in setting the hearing without regard to the time required for discovery and without consideration of the existing obligations of the parties, their legal representatives and consultants and reflecting bias against junior water right uses.

The Coalition of Cities reserves the right to supplement this list of issues as information is learned through the discovery process.

Attorneys for Idaho Ground Water Appropriators, Inc. (IGWA)

STATE OF IDAHO

DEPARTMENT OF WATER RESOURCES

IN THE MATTER OF THE DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY AND FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **IGWA's Statement of Issues**

Idaho Ground Water Appropriators, Inc. (IGWA), acting for and on behalf of North Snake Ground Water District, Carey Valley Ground Water District, Magic Valley Ground Water District, Aberdeen-American Falls Area Ground Water District, Jefferson-Clark Ground Water District, Madison Ground Water District, and Henry's Fork Ground Water District, files this statement of issues pursuant to the *Scheduling Order and Order Authorizing Remote Appearance at Hearing* issued May 2, 2023, in this matter.

This proceeding involves the *Fifth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* ("Fifth Methodology Order") issued only three weeks ago, on April 21-2023. It was issued without a prior hearing and is based on evidence that is not in the record of this contested case. Consequently, it is impossible at this stage for IGWA to identify all issues it wishes to address at the hearing in this matter. IGWA is still in the process of retaining technical experts needed to

analyze certain components of the Fifth Methodology Order. IGWA cannot provide a definitive list of issues it wishes to address until discovery has been completed and IGWA's technical experts complete their review of the facts and analyses utilized by the Department in developing the Fifth Methodology Order.

Until then, IGWA preliminary identifies as issues for hearing all issues listed in *Pocatello's Statement of Issues* filed May 4, 2023, and *Coalition of Cities Statement of Issues* filed May 5, 2023. IGWA reserves the right to address issues identified by any other party to this proceeding, and any additional issues that IGWA identifies during discovery and develops in preparation for hearing in this matter.

As counsel for IGWA represented to the Director at the pre-hearing conference held April 28, 2023, the hearing currently scheduled for June 6-10, 2023, does not afford adequate time for IGWA to complete discovery, conduct a thorough review of all components of the Fifth Methodology Order, perform site investigations, develop expert reports, develop and organize evidence for presentation at the hearing, and otherwise fairly prepare for the hearing. Therefore, if the hearing is not continued until at least October, IGWA will be deprived of due process, and will not be able to address all issues raised by the Fifth Methodology Order.

DATED this 5th day of May, 2023.

Attorney for McCain Foods USA, Inc.

BEFORE THE DEPARTMENT OF WATER RESOURCES

OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	**Docket No. CM-DC-2010-001** **MCCAIN FOODS USA, INC.'S STATEMENT OF ISSUES**

Pursuant to the oral order at the Prehearing conference in this matter held on April 28, 2023, by and through the undersigned attorney, McCain Foods USA, Inc. ("McCain") files this Statement of Issue.

STATEMENT OF ISSUES FOR HEARING

McCain identifies the following issues for hearing:

a) IDWR's new reliance on transient modeling;

b) IDWR's failure to consider the Twin Falls Canal Company's increase in diversions over the last twenty years;

d) IDWR's failure to consider changes in the efficiency of the SWC's operations;

e) IDWR's failure to consider all sources of supply available to the SWC;

f) IDWR's use of 2018 as the new baseline year; and

g) IDWR's violation of McCain's due process rights by not providing it actual notice of the order and requisite deadlines, and even if it was deemed that it was given "notice" because it shared an attorney with the Coalition of Cities, by giving it less than 10 business days to provide a mitigation solution after a wholesale change in methodology, by depriving it of the ability to develop its own mitigation plan to protect its water rights, by requiring compliance with a deadline to avoid curtailment without actual notice of the deadline and in a non-drought year, by setting the hearing without regard to the time required for discovery and without consideration of the existing obligations of the parties, their legal representatives and consultants.

Attorneys for Idaho Ground Water Appropriators, Inc. (IGWA)

STATE OF IDAHO

DEPARTMENT OF WATER RESOURCES

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **Notice of Ground Water District Mitigation**

Idaho Ground Water Appropriators, Inc. ("IGWA"), acting on behalf of North Snake Ground Water District, Carey Valley Ground Water District, Magic Valley Ground Water District, Aberdeen-American Falls Ground Water District, Bingham Ground Water District, Bonneville-Jefferson Ground Water District, Jefferson-Clark Ground Water District, Madison Ground Water District, and Henry's Fork Ground Water District (collectively, the "Districts"), hereby provides notice that the Districts can mitigate for their proportionate share of the demand shortfall predicted in the Final Order Regarding April Forecast Supply (Methodology Steps 1-3) ("April 2023 As-Applied Order") issued April 21, 2023, in this matter.

Background

The April 2023 As-Applied Order applies steps 1-3 of the Fifth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover. It predicts that the Surface Water Coalition ("SWC") will experience an in-season demand shortfall of 75,200 acre-feet in the absence of mitigation by junior-priority groundwater users. The order states: "On or before May 5, 2023, ground water users holding consumptive

water rights bearing priority dates junior to December 30, 1953, within the Eastern Snake Plain Aquifer area of common ground water supply shall establish, to the satisfaction of the Director, that they can mitigate for their proportionate share of the predicted DS of 75,200 acre-feet in accordance with an approved mitigation plan." (April 2023 As-Applied Order, p. 6.) "IGWA's proportionate share of the predicted DS of 75,200 acre-feet is 63,645 acre-feet." *Id*. at 5, fn 5.

IGWA has three approved mitigation plans. Its "Storage Water Plan" authorizes the Districts to provide mitigation via the delivery of storage water to the SWC. (Order Approving Mitigation Plan, *In the Matter of the Idaho Ground Water Appropriators, Inc.'s Mitigation Plan in Response to the Surface Water Coalition's Water Delivery Call*, IDWR Docket No. CM-MP-2009-007, June 3, 2010, p. 10.) Under this plan, "IGWA must provide proof of rental or an option to rent storage water and of a commitment of the storage water to the SWC within the deadlines provided by the Methodology Order and any order of the Director implementing the Methodology Order for a given year." *Id*.

IGWA's "Aquifer Enhancement Plan" authorizes the Districts to obtain mitigation credit for reach gains that accrue to the SWC as a result of (a) conversions of farmland from groundwater to surface water irrigation; (b) fallowing of groundwater-irrigated acres through the Conservation Reserve Enhancement Program (CREP), Agricultural Water Enhancement Program (AWEP), or other voluntary program; and (c) groundwater recharge." (Order Approving Mitigation Plan, *In the Matter of the Idaho Ground Water Appropriators, Inc.'s Mitigation Plan for Conversions, Dry-Ups, and Recharge*, IDWR Docket No. CM-MP-2009-006, May 14, 2010, p. 1.) Under this plan, "[i]f mitigation credit is sought by IGWA, the Director shall determine the appropriate credit, if any, to provide." *Id*. at 2.

IGWA's "Settlement Agreement Plan" authorizes the Districts to obtain mitigation protection by complying with a settlement agreement entered into between the Districts and the SWC in 2015. (Final Order Approving Stipulated Mitigation Plan, *In the Matter of IGWA's Settlement Agreement Mitigation Plan*, IDWR Docket No. CM-MP-2016-001, May 2, 2016; Final Order Approving Amendment to Stipulated Mitigation Plan, *In the Matter of IGWA's Settlement Agreement Mitigation Plan*, IDWR Docket No. CM-MP-2016-001, May 9, 2017.) Under this plan, the Districts are required to conserve 240,000 acre-feet of water and deliver 50,000 acre-feet of storage annually to the SWC as set forth in the Amended Final Order Regarding Compliance with Approved Plan issued April 24, 2023.

Notice of Mitigation

The Districts identified in the following table will provide mitigation to the SWC under the Storage Water Plan. These districts' proportionate shares of the 63,645 acre-feet demand shortfall predicted in the April 2023 As-Applied Order are as follows:

District	Proportionate Share
Bingham GWD	13,384
Bonneville-Jefferson GWD	8,469
Jefferson-Clark GWD	6,939
Total	28,792

Attached hereto as Appendix A are copies of storage water leases totaling 38,714 acre-feet, submitted on behalf of the above-identified Districts.

The Districts identified in the following table will provide mitigation under the Settlement Agreement Plan. These Districts' proportionate shares of the 240,000 acre-feet of conservation and the 50,000 acre-feet of storage obligations are as follows:

District	240,000 AF	50,000 AF
Aberdeen-American Falls GWD	39,395	8,705
Carey Valley GWD	821	173
Henry's Fork GWD + Madison GWD	6,299	0
Magic Valley GWD	37,931	8,000
North Snake GWD	29,765	6,410
Total	114,211	23,288

Each District's proportionate share of 240,000 is based on the Director's allocation set forth in the *Amended Final Order Regarding Compliance with Approved Mitigation Plan* issued April 24, 2023, in this matter. Each District's proportionate share of 50,000 is based on the allocation IGWA has utilized since the Settlement Agreement Plan was implemented in 2016. The Settlement Agreement Plan does not require that storage water contracts be reported to the SWC or IDWR; it simply requires that storage be "delivered to SWC 21 days after the date of allocation." However, IGWA reports voluntarily that the above-identified Districts have storage leases in place for 23,288 acre-feet.

Dated this 5th day of May, 2023.

APPENDIX A

Storage Leases

Bingham Ground Water District
Bonneville-Jefferson Ground Water District
Jefferson-Clark Ground Water District

WATER DISTRICT #1 RENTAL POOL - PRIVATE LEASE AGREEMENT

Idaho Irrigation District (lessor) agrees to lease 6,678 acre-feet of storage to Bingham Ground Water District (lessee) for the 2023 irrigation season at a price of $[redacted] according to the rules and regulations contained in the Water District #1 Rental Pool Procedures.

Description of Lease:

Name of River or Stream from which lease is diverted: Snake River

Canal or Pump Name and location: TBD

Place of Use description: TBD

Water Right Appurtenant to Lands: TBD

An Idaho Water Resources Board surcharge (10% of the purchase price) plus a $1.30 per acre-foot administrative fee must be received by Water District #1 prior to the approval of the storage lease).

If the reservoir storage system fails to fill in the season following the year leased, the lessor's storage allocation shall be reduced by the amount leased to offset any impacts to other spaceholders' storage accruals according to the approved Water District #1 Rental Pool Procedures pursuant to Idaho Code Section 42-1765. The lessor understands the net effect of this rule is to make an amount of the lessor's space (equal to the amount leased) last-to-fill in the reservoir system for the irrigation season following the lease.

☐ If the lease is for irrigation purposes, the Applicant, by checking this box, certifies that the use of this leased storage water complies with the moratorium on new consumptive uses as outlined in Rental Pool Procedure 3.4. Failure to meet the conditions contained in Rental Pool Procedure 3.4 may be grounds for denying the application.

If the leased storage is diverted by a diversion outside the area regulated by Water District #1, the applicant, by signing this agreement agrees to report to the Watermaster of the water district containing the diversion, the daily amounts of leased storage diverted during the year. The Watermaster of that district, according to Rental Pool Procedure 4.3.108, must then report to the Water District #1 Watermaster the daily rental diverted by November 30th. Failure to report the daily rental diversion may result in the rental not being delivered in Water District #1's final rental delivery records.

STORAGE WATER LEASE

This Storage Water Lease ("Lease") is entered into between Enterprize Canal Co., whose mailing address is PO BOX 583, Ririe, ID 83443, ("Lessor"), and the Bonneville Jefferson Ground Water District whose mailing address is P.O. Box 51121, Idaho Falls, Idaho 83204.

RECITALS

A. Lessor has the right to use, lease, and assign storage water allocated and available to Lessor as a space holder in the Idaho Water District 1 reservoir system pursuant to Lessor's Storage Water Contracts with the United States Bureau of Reclamation ("Reclamation").

B. BONNEVILLE JEFFERSON GROUND WATER DISTRICT desires to lease storage water to satisfy mitigation obligations determined by the Director of the Idaho Department of Water Resources ("Department") and related purposes, such as aquifer recharge and converting farmland from ground to surface water irrigation.

C. Lessor desires to lease storage water to BONNEVILLE JEFFERSON GROUND WATER DISTRICT, and BONNEVILLE JEFFERSON GROUND WATER DISTRICT desires to lease storage water from Lessor, pursuant to the terms of this Lease.

LEASE

1. **Storage Water Lease.** Lessor hereby leases to Bonneville Jefferson Ground Water District 4,000 acre feet of storage water for 2023 only, at which the Bonneville Jefferson Ground Water District is required to pay rent at a rate of $[redacted].

2. **Term.** The initial term of this Lease shall be for a period of one (1) year, commencing January 1, 2023, and ending December 31, 2023.

3. **Payment of Rent.** Bonneville Jefferson Ground Water District will pay the rent to Lessor in two equal installments. The first installment on or before May 1, of 2023, and the final installment on or before November 1, of 2023.

4. **Administrative Fees.** BONNEVILLE JEFFERSON GROUND WATER DISTRICT will pay all administrative fees imposed by Water District 1 and the Idaho Water Resource Board.

5. **Use of Leased Water.**
   5.1 The assignment, delivery, and use of leased storage water will be determined by BONNEVILLE JEFFERSON GROUND WATER DISTRICT and is subject to the final accounting for the year by the Watermaster of Water District 1

and any applicable Water District 1 Rental Pool Rules.

5.2 This Lease does not include any right to use storage water below Milner Dam.

5.3 The storage water available to Bonneville Jefferson Ground Water District under this Lease may be assigned and delivered by Bonneville Jefferson Ground Water District to any of its members or to any other person or entity for the authorized uses of recharge, mitigation, irrigation, or other lawful use at any time up to December 1 each year.

5.4 Any storage water not used or assigned by Bonneville Jefferson Ground Water District by December 1 shall remain in Lessor's Water District 1 storage account and then belong only to Lessor.

5.5 Lessor understands that any storage water leased may be subject to the Water District 1 Rental Pool Rules.

6. **Representations by Lessor.** Lessor covenants and represents that:

6.1 It will provide to Bonneville Jefferson Ground Water District all storage water leased under this Lease.

6.2 It is the true and lawful owner of the storage water and that nothing restricts or precludes Lessor from entering into this Lease.

7. **Breach.** If either party defaults in the performance of its obligations under this Lease, and such default is not cured within thirty (30) days after receipt of written notice thereof, the non-breaching party, at its option, may elect to pursue remedies for breach of contract in district court.

8. **Assignment.** This Lease may not be assigned by Bonneville Jefferson Ground Water District without the express written consent of Lessor, but the storage water leased by Bonneville Jefferson Ground Water District under this Lease may be assigned or otherwise made available to any other person or entity.

9. **Dispute Resolution.** Any substantial dispute between the parties shall be resolved in accordance with the following provisions.

9.1 Good Faith Negotiation. Upon written notice from one party to the other, authorized representatives of the parties will attempt in good faith to resolve the dispute by negotiation.

9.2 Mediation. If the dispute cannot be resolved by good faith negotiation, either party may demand that the dispute be subjected to mediation

by a mediator designated by mutual Lease of the parties. The mediation will be held in Bonneville County, Idaho, unless the parties mutually agree to a different location. Mediator costs will be split equally between the parties.

9.3 Litigation. Litigation is allowed between the parties only: (i) if the dispute is not resolved by mediation, (ii) for the purpose of enforcing a settlement Lease entered into between the parties, or (iii) to seek temporary injunctive relief if a party deems such action necessary to avoid irreparable damage. The pursuit or granting of temporary injunctive relief does not excuse the parties from participating in good faith negotiation and mediation as set forth above. The prevailing party in any litigation is entitled to recover reasonable attorney fees and costs.

9.4 Governing Law, Jurisdiction, and Venue. This Lease will be construed and interpreted in accordance with the laws of the State of Idaho. The parties agree that the courts of Idaho shall have exclusive jurisdiction, and agree that Bonneville County is the proper venue.

9.5 Exclusive Procedures. The procedures specified in this section 9 are the exclusive procedures for the resolution of disputes between the parties. All applicable statutes of limitation shall be tolled while the negotiation and mediation procedures specified in section 9.3 are pending.

10. **Notices.** All notices given pursuant to this Lease must be in writing and shall be sent in one of the following manners: (a) by certified mail, return receipt requested, postage prepaid; (b) by recognized overnight courier such as Federal Express; (c) by facsimile transmission; (d) by email if the receiving party acknowledges receipt of the emailed notice. Notices shall be deemed received on the earlier of actual receipt, three days after mailing for certified mail and regular mail, the next business day if given by fax, or the date the receiving party acknowledges receipt of email notice.

ADDRESSES TO BE USED FOR NOTICES AND DELIVERY OF LEASE PAYMENTS SHALL BE AS FOLLOWS:

STORAGE WATER LEASE

This Storage Water Lease ("Lease") is entered into between Idaho Irrigation District, whose address is 496 E 14th St, Idaho Falls, ID 83404, Idaho Falls, Idaho 83402 ("Lessor"), and the Bonneville Jefferson Ground Water District whose mailing address is P.O. Box 51121, Idaho Falls, Idaho 83204.

RECITALS

A. Lessor has the right to use, lease, and assign storage water allocated and available to Lessor as a space holder in the Idaho Water District 1 reservoir system pursuant to Lessor's Storage Water Contracts with the United States Bureau of Reclamation ("Reclamation").

B. BONNEVILLE JEFFERSON GROUND WATER DISTRICT desires to lease storage water to satisfy mitigation obligations determined by the Director of the Idaho Department of Water Resources ("Department") and related purposes, such as aquifer recharge and converting farmland from ground to surface water irrigation.

C. Lessor desires to lease storage water to BONNEVILLE JEFFERSON GROUND WATER DISTRICT, and BONNEVILLE JEFFERSON GROUND WATER DISTRICT desires to lease storage water from Lessor, pursuant to the terms of this Lease.

LEASE

1. **Storage Water Lease.** Lessor hereby leases to Bonneville Jefferson Ground Water District 4,000 acre feet of storage water for 2023 only, at which the Bonneville Jefferson Ground Water District is required to pay rent at a rate of $[redacted].

2. **Term.** The initial term of this Lease shall be for a period of one (1) year, commencing January 1, 2023, and ending December 31, 2023.

3. **Payment of Rent.** Bonneville Jefferson Ground Water District will pay the rent to Lessor in two equal installments. The first installment on or before ~~May 1~~ JULY 15, of 2023, and the final installment on or before November 1, of 2023.

4. **Administrative Fees.** BONNEVILLE JEFFERSON GROUND WATER DISTRICT will pay all administrative fees imposed by Water District 1 and the Idaho Water Resource Board.

5. **Use of Leased Water.**

5.1 The assignment, delivery, and use of leased storage water will be determined by BONNEVILLE JEFFERSON GROUND WATER DISTRICT and is subject to the final accounting for the year by the Watermaster of Water District 1

and any applicable Water District 1 Rental Pool Rules.

5.2 This Lease does not include any right to use storage water below Milner Dam.

5.3 The storage water available to Bonneville Jefferson Ground Water District under this Lease may be assigned and delivered by Bonneville Jefferson Ground Water District to any of its members or to any other person or entity for the authorized uses of recharge, mitigation, irrigation, or other lawful use at any time up to December 1 each year.

5.4 Any storage water not used or assigned by Bonneville Jefferson Ground Water District by December 1 shall remain in Lessor's Water District 1 storage account and then belong only to Lessor.

5.5 Lessor understands that any storage water leased may be subject to the Water District 1 Rental Pool Rules.

6. **Representations by Lessor.** Lessor covenants and represents that:

6.1 It will provide to Bonneville Jefferson Ground Water District all storage water leased under this Lease.

6.2 It is the true and lawful owner of the storage water and that nothing restricts or precludes Lessor from entering into this Lease.

7. **Breach.** If either party defaults in the performance of its obligations under this Lease, and such default is not cured within thirty (30) days after receipt of written notice thereof, the non-breaching party, at its option, may elect to pursue remedies for breach of contract in district court.

8. **Assignment.** This Lease may not be assigned by Bonneville Jefferson Ground Water District without the express written consent of Lessor, but the storage water leased by Bonneville Jefferson Ground Water District under this Lease may be assigned or otherwise made available to any other person or entity.

9. **Dispute Resolution.** Any substantial dispute between the parties shall be resolved in accordance with the following provisions.

9.1 Good Faith Negotiation. Upon written notice from one party to the other, authorized representatives of the parties will attempt in good faith to resolve the dispute by negotiation.

9.2 Mediation. If the dispute cannot be resolved by good faith negotiation, either party may demand that the dispute be subjected to mediation

11. **Binding Effect.** This Lease shall be binding upon the respective heirs, successors, and assigns of the parties.

STORAGE WATER LEASE

This Storage Water Lease ("Lease") is entered into between Snake River Valley Irrigation District, whose address is 816 N. 700 E., with a mailing address at PO BOX 70, Basalt, ID 83218, ("Lessor"), and the Bonneville Jefferson Ground Water District whose mailing address is P.O. Box 51121, Idaho Falls, Idaho 83204.

RECITALS

A. Lessor has the right to use, lease, and assign storage water allocated and available to Lessor as a space holder in the Idaho Water District 1 reservoir system pursuant to Lessor's Storage Water Contracts with the United States Bureau of Reclamation ("Reclamation").

B. BONNEVILLE JEFFERSON GROUND WATER DISTRICT desires to lease storage water to satisfy mitigation obligations determined by the Director of the Idaho Department of Water Resources ("Department") and related purposes, such as aquifer recharge and converting farmland from ground to surface water irrigation.

C. Lessor desires to lease storage water to BONNEVILLE JEFFERSON GROUND WATER DISTRICT, and BONNEVILLE JEFFERSON GROUND WATER DISTRICT desires to lease storage water from Lessor, pursuant to the terms of this Lease.

LEASE

1. **Storage Water Lease**. Lessor hereby leases to Bonneville Jefferson Ground Water District 4,000 acre feet of storage water for 2023 only, at which the Bonneville Jefferson Ground Water District is required to pay rent at a rate of $[redacted].

2. **Term**. The initial term of this Lease shall be for a period of one (1) year, commencing January 1, 2023, and ending December 31, 2023.

3. **Payment of Rent**. Bonneville Jefferson Ground Water District will pay the rent to Lessor in two equal installments. The first installment on or before May 1, of 2023, and the final installment on or before November 1, of 2023.

4. **Administrative Fees**. BONNEVILLE JEFFERSON GROUND WATER DISTRICT will pay all administrative fees imposed by Water District 1 and the Idaho Water Resource Board.

5. **Use of Leased Water**.

   5.1 The assignment, delivery, and use of leased storage water will be determined by BONNEVILLE JEFFERSON GROUND WATER DISTRICT and is subject to the final accounting for the year by the Watermaster of Water District 1 and any applicable Water District 1 Rental Pool Rules.

5.2 This Lease does not include any right to use storage water below Milner Dam.

5.3 The storage water available to Bonneville Jefferson Ground Water District under this Lease may be assigned and delivered by Bonneville Jefferson Ground Water District to any of its members or to any other person or entity for the authorized uses of recharge, mitigation, irrigation, or other lawful use at any time up to December 1 each year.

5.4 Any storage water not used or assigned by Bonneville Jefferson Ground Water District by December 1 shall remain in Lessor's Water District 1 storage account and then belong only to Lessor.

5.5 Lessor understands that any storage water leased may be subject to the Water District 1 Rental Pool Rules.

6. **Representations by Lessor**. Lessor covenants and represents that:

6.1 It will provide to Bonneville Jefferson Ground Water District all storage water leased under this Lease.

6.2 It is the true and lawful owner of the storage water and that nothing restricts or precludes Lessor from entering into this Lease.

7. **Breach**. If either party defaults in the performance of its obligations under this Lease, and such default is not cured within thirty (30) days after receipt of written notice thereof, the non-breaching party, at its option, may elect to pursue remedies for breach of contract in district court.

8. **Assignment**. This Lease may not be assigned by Bonneville Jefferson Ground Water District without the express written consent of Lessor, but the storage water leased by Bonneville Jefferson Ground Water District under this Lease may be assigned or otherwise made available to any other person or entity.

9. **Dispute Resolution**. Any substantial dispute between the parties shall be resolved in accordance with the following provisions.

9.1 Good Faith Negotiation. Upon written notice from one party to the other, authorized representatives of the parties will attempt in good faith to resolve the dispute by negotiation.

9.2 Mediation. If the dispute cannot be resolved by good faith negotiation, either party may demand that the dispute be subjected to mediation

by a mediator designated by mutual Lease of the parties. The mediation will be held in Bonneville County, Idaho, unless the parties mutually agree to a different location. Mediator costs will be split equally between the parties.

9.3 Litigation. Litigation is allowed between the parties only: (i) if the dispute is not resolved by mediation, (ii) for the purpose of enforcing a settlement Lease entered into between the parties, or (iii) to seek temporary injunctive relief if a party deems such action necessary to avoid irreparable damage. The pursuit or granting of temporary injunctive relief does not excuse the parties from participating in good faith negotiation and mediation as set forth above. The prevailing party in any litigation is entitled to recover reasonable attorney fees and costs.

9.4 Governing Law, Jurisdiction, and Venue. This Lease will be construed and interpreted in accordance with the laws of the State of Idaho. The parties agree that the courts of Idaho shall have exclusive jurisdiction, and agree that Bonneville County is the proper venue.

9.5 Exclusive Procedures. The procedures specified in this section 9 are the exclusive procedures for the resolution of disputes between the parties. All applicable statutes of limitation shall be tolled while the negotiation and mediation procedures specified in section 9.3 are pending.

10. **Notices**. Attorneys for Bonneville-Jefferson Ground Water District

STATE OF IDAHO

DEPARTMENT OF WATER RESOURCES

IN THE MATTER OF THE DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY AND FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **BONNEVILLE-JEFFERSON GROUND WATER DISTRICT'S STATEMENT OF ISSUES**

The Bonneville-Jefferson Ground Water District (hereafter "Bonneville-Jefferson"), acting for and on behalf of its respective members, through counsel, submits this *Statement of Issues* pursuant to the Director's May 2, 2023, *Scheduling Order and Order Authorizing Remote Appearance at Hearing*.

As a threshold matter, Bonneville-Jefferson notes that the Orders at issue in this matter were issued a mere three weeks ago on April 21, 2023. Bonneville-Jefferson was not provided notice or an opportunity to be heard prior to these Orders being issued, nor has it been provided

any of the information the Department relied upon in issuing these Orders as of the date of this filing.

During the preliminary hearing before the Department on April 28, 2023, counsel for Bonneville-Jefferson joined in support of the Coalition of Cities' *Motion to Continue* the June 6, 2023, hearing on the Orders, raising concerns that it would not have sufficient time to obtain and review relevant information with its experts. This will impair Bonneville-Jefferson's ability to adequately review relevant information and develop evidence opposing the Orders before the scheduled hearing date. These concerns still abound, and Bonneville-Jefferson maintains that it will be deprived of due process and will not be able to address all issues raised by the Fifth Methodology Order should the Director not continue the hearing.

Without waiving any objection or defense, Bonneville-Jefferson submits the following *Statement of Issues* without the benefit of discovery, including the ability to review information the Department reconduct depositions, and with a limited information:

1) The procedures and process used by the Department in issuing the Methodology Order.
2) The technical rational for the Methodology Order.
3) The policy behind changing to transient state modeling in the Methodology Order.
4) The analysis and factual basis for the Methodology Order.
5) The Department's new reliance on transient modeling.
6) The Department's failure to consider the Twin Falls Canal Company's increase in diversions over the last twenty years.
7) The Department's failure to consider changes in the efficiency of the SWC's operations.
8) The Department's failure to consider all sources of supply available to the SWC

9) The Department's rational and factual basis for using 2018 as the new baseline year.

10) Issues pertaining to futile call, including waste, reasonable time, and efficiency.

11) Whether the Methodology Order results in the optimum development of water resources in the public interest.

12) Whether the Methodology Order is contrary to the State's interest in securing the maximum use and benefit, and least wasteful use, of its water resources

13) Whether the Methodology Order permits SWC to command the entirety of large volumes of water in a surface or ground water source to support its appropriation contrary to the public policy of reasonable use of water as described in the Rules for Conjunctive Management of Surface and Ground Water Resources, IDAPA 37.03.11.

14) Whether the Department provided due process to water users in issuing the Methodology Order.

15) Bonneville-Jefferson reserves the right to present evidence, argument, and rebuttal as to any issues presented by other parties in this matter.

16) Bonneville-Jefferson further reserves the right to contest additional issues regarding the Fifth Methodology Order and the As-Applied Order that may be revealed through the discovery process.

Respectfully submitted this the 5th day of May 2023.

Attorney for Bingham Groundwater District. (BGWD)

STATE OF IDAHO

DEPARTMENT OF WATER RESOURCES

IN THE MATTER OF THE DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY AND FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **BINGHAM GROUND WATER DISTRICT'S REQUEST FOR HEARING**

The Bingham Ground Water District (hereafter "Bingham"), acting for and on behalf of its respective members, through counsel, submits this Request for Hearing pursuant to Idaho Code § 42-1701(A)(3), Idaho Code § 67-5246(4), and Rule 740.02.b. of the Rules of Procedure of the Idaho Department of Water Resources, requesting a hearing on the Department's *Fifth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* ("Fifth Methodology Order")

and *Final Order Regarding April 2023 Forecast Supply* ("April 2023 As-Applied Order") issued April 21, 2023.

Bingham is in the process of reviewing the Fifth Methodology Order and the April 2023 As-Applied Order, but plans to address the issues identified in the *Coalitions of Cities' Amended Request for Hearing, Pocatello's Request for Hearing* filed April 28, 2023, and *Bonneville-Jefferson Ground Water District's Request for Hearing* filed May 4, 2023. Bingham reserves the right to present additional issues that may be revealed through the discovery process. Bingham reserves the right to identify additional ground for contesting the Director's action once it completes a thorough review of the Fifth Methodology Order and the As- Applied Order.

Respectfully submitted this the 5th day of May 2023.

Attorneys for the City of Idaho Falls

BEFORE THE DEPARTMENT OF WATER RESOURCES
OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY

CITY OF IDAHO FALLS STATEMENT OF ISSUES

The City of Idaho Falls ("Idaho Falls" or "City"), by and through its counsel, Holden, Kidwell, Hahn & Crapo, P.L.L.C., submits this *City of Idaho Falls Statement of Issues*.

On Aril 21, 2023, the Director of the Idaho Department of Water Resources ("IDWR" or "Department") issued a *Fifth Amended Methodology Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand And Reasonable Carryover* (the "*Methodology Order*") and a *Final Order Regarding April 2023 Forecast Supply* ("*2023 As-Applied Order*"). Idaho Falls timely filed a *Challenge and Request for Hearing* on May 4, 2023. Pursuant to the Director's May 2, 2023, *Scheduling Order and Order Authorizing Remote Appearance at Hearing*, Idaho Falls files its statement of issues in the above captioned matter.

Based on what is known now, and without the benefit of discovery, including the ability to conduct depositions, counsel for Idaho Falls identifies the following issues for the hearing:

1. Whether IDWR's new reliance on transient modeling as opposed to steady-state modeling are reasonable;
2. Whether the Eastern Snake Plain Aquifer Model has been shown to be sufficiently accurate to support the proposed transient groundwater modeling to determine curtailment dates;
3. Whether a baseline demand that incorporates increases in SWC member diversions in recent years is a valid basis for conjunctive administration;
4. The reasonableness of Project efficiencies of the SWC members, trends in the efficiencies in recent years, and how the efficiency values are used in determining reasonable in-season demands;
5. Whether IDWR failed to consider all sources of water supply to the SWC;
6. Whether 2018 is a reasonable new baseline year;
7. Whether changes to determination of the reasonable in-season demand for the SWC members are reasonable and appropriate;
8. Whether IDWR's failure to fully evaluate potential changes to the methodology used to determine the crop water needs of the SWC members is reasonable;
9. Whether IDWR's failure to fully evaluate potential changes to the methodology for forecasting the irrigation supplies of the SWC members is reasonable;
10. Whether IDWR's failure to fully evaluate changes to the methodology for determining reasonable carryover for the SWC members is reasonable;

11. Whether IDWR's failure to fully evaluate changes to the timing and procedures for updating the forecast shortages to the SWC members after the initial determination in April is reasonable;
12. Whether IDWR's failure to investigate whether the SWC members are using the water they divert efficiently and without waste, and in compliance with the terms of their decreed water rights;
13. Whether it was lawful and/or appropriate for IDWR to fail to apply all factors in the Department's Rules for Conjunctive Management of Surface and Ground Water Resources, IDAPA 37.03.11, including but not limited to CM Rule 20.03 and principles of reasonableness generally; and
14. IDWR's violation of due process rights of all interested water users:
    a. by engaging in an ineffective public process related to the Department's convening of the "Technical Work Group" to discuss modifications to the Fourth Methodology Order; and
    b. by setting the hearing without regard to the time required for discovery and without consideration of the existing obligations of the parties, their legal representatives, and consultants.

The above is based upon Idaho Falls' current understanding issues involved in this proceeding, but without the benefit of discovery and other due process. Additional issues may be identified as this matter develops.

Dated this 5th day of May, 2023.

/s/ Robert L. Harris
Robert L. Harris, Esq.
HOLDEN, KIDWELL, HAHN & CRAPO, P.L.L.C.

Attorneys for American Falls Reservoir District #2 and Minidoka Irrigation District

BEFORE THE DEPARTMENT OF WATER RESOUCES

OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **SURFACE WATER COALITION'S REQUEST FOR HEARING AND STATEMENT OF ISSUES**

COME NOW, A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGAITON DISTRICT, NORTH SIDE CANAL COMPANY, and TWIN FALLS CANAL COMPANY ("Surface Water Coalition" or "Coalition"), by and through counsel of record, and hereby request a hearing in the above-referenced matter pursuant to I.C. § 42-1701A(3) and submit the following list of issues regarding the Director's *Fifth Amended*

Order Regarding Methodology et al. and the *Final Order Regarding April 2023 Forecast Supply* issued on April 21, 2023.

I. *Fifth Methodology Order*

The Coalition requests a hearing on the following issues:

1) Whether 2018 is the proper baseline year for each Coalition member pursuant to the criteria identified in the methodology order;
2) Whether the reasonable carryover amounts identified for each Coalition member are proper pursuant to the criteria identified in the methodology order;
3) Whether current year project efficiency is recalculated for each year after Cropland Data Layer (CDL) data for this year becomes available and prior to this current year's project efficiency being used in the 15-year rolling average;
4) Whether current year project efficiency is recalculated for each year after CDL updates become available and are included in the 15-year rolling average; and
5) Whether the Coalition members can receive assigned mitigation storage water if they do not participate in the Water District 01 rental pool.

II. *April As Applied Order*

The Coalition requests a hearing on the following issue:

1) Whether the order provides that IGWA has an option to comply with the mitigation plan approved in CM-MP-2016-001 to avoid curtailment by complying with the mitigation plan approved in CM-MP-2009-007 instead;

A&B Irrigation District requests a hearing on the following issues:

1) Whether the order's identified proportionate share (458 acre-feet) of the predicted injury (75,200 acre-feet) to TFCC is calculated correctly based upon A&B's actual diversion

and use of water rights that are subject to the identified curtailment date (junior to December 30, 1953); and

2) Whether the steady-state use of the ESPAM 2.2 in identifying A&B's proportionate share is consistent with the transient use of the model in identifying ground water rights subject to curtailment as outlined in the *Fifth Methodology Order*.

Re: SWC Delivery Call / Notice of Mitigation Water (*Final Order Regarding April 2023 Forecast Supply (Steps 1-3)*

Dear Tony:

I am writing on behalf of the Falls Irrigation District ("Falls" or "District") in reference to the Director's April 21, 2023 *Final Order Regarding April 2023 Forecast Supply* ("April Order"). In that order the Director noted that affected junior ground water right holders must establish "that they can mitigation for their proportionate share of the predicted demand shortfall of 75,200 acre-feet in accordance with an approved mitigation plan." *See* April Order at 6. To Falls' knowledge, the Director has not yet identified Falls' proportionate share with respect to certain junior priority ground water rights held by Falls.

Falls is reserving the right to participate in the hearing on the Director's calculation of its "proportionate share" of the April forecasted injury and that matter is set to be heard June 6-10, 2023. Falls reserves all rights with respect to this issue and by communicating this notice does not waive any of those rights with respect to the Director's order. Whether the District's proportionate share will change is unknown at this time.

Notwithstanding, Falls hereby provides notice of available mitigation water and requests that you confirm to the Director that the proportionate share of Falls' 2023 storage allocation will be available for assignment and delivery to mitigate injury to TFCC as predicted in the April Order if necessary. As you may be aware Falls carried over 13,722 acre-feet in its Palisades Reservoir space from 2022, and its American Falls Reservoir space is currently filling in 2023.

Regardless of the final allocation, it is believed that Falls has sufficient storage to deliver to injured Coalition members, including TFCC, for mitigation purposes if required.

D - 208 . 999 . 5903 | E - jsimpson@martenlaw. | P.O. Box 2139, Boise, ID 83701-2139

Falls believes this letter satisfies the Director's April Order. If you have any questions please call me at (208) 336-0700.

Sincerely,

/s/ John Simpson

Re: SWC Delivery Call / Notice of Mitigation Water (*Final Order Regarding April 2023 Forecast Supply (Steps 1-3)*)

Dear Tony:

I am writing on behalf of the A&B Irrigation District ("A&B" or "District") in reference to the Director's April 21, 2023 *Final Order Regarding April 2023 Forecast Supply* ("April Order"). In that order the Director noted that affected junior ground water right holders must establish "that they can mitigation for their proportionate share of the predicted demand shortfall of 75,200 acre-feet in accordance with an approved mitigation plan." *See* April Order at 6. The Director identified A&B's proportionate share as 458 acre-feet with respect to certain junior priority ground water rights held by A&B (36-15127A et al.). *See id.* at 5, n. 5. A&B also has an approved mitigation plan. *See Final Order Approving Mitigation Plan*, CM-MP-2015-003, Dec. 16, 2015.

A&B is requesting a hearing on the Director's calculation of its "proportionate share" of the April forecasted injury and that matter is set to be heard June 6-10, 2023. A&B reserves all rights with respect to this issue and by communicating this notice does not waive any of those rights with respect to the Director's order. Whether the District's proportionate share will change is unknown at this time.

Notwithstanding, A&B hereby provides notice of available mitigation water and requests that you confirm to the Director that 458 acre-feet of A&B's 2023 storage allocation will be available for assignment and delivery to mitigate injury to TFCC as predicted in the April Order if necessary. As you may be aware A&B carried over 58,900 acre-feet in its Palisades Reservoir space from 2022, and its American Falls Reservoir space is currently filling in 2023.

D – 208 . 735 . 2227 | E - tthompson@martenlaw.com | P.O. Box 63, Twin Falls, ID 83303-0063

Regardless of the final allocation, A&B presently has 458 acre-feet to deliver to injured Coalition members, including TFCC, for mitigation purposes if required.

A&B believes this letter satisfies the Director's April Order. If you have any questions please call me at (208) 733-0700.

Sincerely,

Travis Thompson
Partner

BEFORE THE DEPARTMENT OF WATER RESOURCES

OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **MOTION FOR RECONSIDERATION OF DENIAL OF CONTINUANCE**

COME NOW, the Cities of Bliss, Burley, Carey, Declo, Dietrich, Gooding, Hazelton, Heyburn, Jerome, Paul, Richfield, Rupert, Shoshone, and Wendell ("Coalition of Cities"), by and through their attorneys of record, Candice M. McHugh and Chris M. Bromley, the City of Idaho Falls, by and through its attorney of record, Robert L. Harris, and the City of Pocatello by and through its attorney of record Sarah A. Klahn (collectively the "Cities"), Idaho Ground Water Appropriators ("IGWA") by and through its attorney of record Thomas

J. Budge, Bingham Ground Water District by and through its attorney, Dylan Anderson and Bonneville-Jefferson Ground Water District, by and through its attorney Skyler Jones, (collectively the "Parties') pursuant to IDAPA 37.01.01.711 of the Department's rules of procedure and hereby file this *Motion for Reconsideration of the Denial of the Continuance* ("Motion") and move for reconsideration of the Director's interlocutory order denying a continuance of the hearing scheduled for June 6-10, 2023, in the above-captioned matter. Additional reasons for a continuance have come to light since the pre-hearing conference in addition to the reasons already set forth in the original motion.

On April 21, 2023, the Director issued a series of orders regarding the Surface Water Coalition ("SWC") delivery call: *Fifth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* ("Methodology Order"); *Final Order Regarding April 2023 Forecast Supply (Methodology Steps 1-3)* ("As-Applied Order"), (collectively the "2023 Orders"). On April 28, 2023, the Director held a pre-hearing conference on the 2023 Orders. The Cities filed a *Motion for Continuance* which was joined by IGWA, GWDs and McCain. The Director orally denied the *Motion for Continuance*. But, he also left the door slightly open by saying: "if … water users as a whole, whose priority dates are junior to the senior water right holders, are either complying with a mitigation plan or have arranged somehow with the senior water right holders to satisfy the obligation, I'm willing to listen to some reasonable requests for delay." Tr. 24: 21- 25: 1.3. Because there is enough water secured to provide the predicted shortage, a reasonably delay is warranted as discussed below.

ARGUMENT

IDWR's procedural rule 711 allows any party affected by an "interlocutory order" to

petition the presiding officer and ask him to "rescind, alter or amend" such order. After further review of the 2023 Orders, the data and documents provided thus far and after consultation with the Cities and Groundwater Users' clients and experts it is apparent that a continuance is necessary because the expert for the City, Greg Sullivan, is unavailable in the weeks leading up to the hearing and IGWA's two experts are also unavailable to attend the hearing and there is not sufficient time to review and respond to the orders and their underlying data and information, take depositions of key Department personnel or witnesses. (See Declarations of Greg Sullivan, Jaxon Higgs, Sophia Sigstedt, Bryce Contor, and Thane Kindred.) Furthermore, IGWA, the Cities and Groundwater users are providing sufficient mitigation this upcoming season so little to no injury will occur to the senior users.

This Motion is supported by the argument below and Declarations filed by the Parties from: Greg Sullivan, Candice McHugh, Jaxon Higgs, Sophia Sigstedt, Bryce Contor and Thane Kindred.

The Parties to this Motion request that the Director reconsider his order denying the continuance and alter and amend the existing hearing date and schedule for the reasons set forth below.

A. Unavailability of Key Witnesses for Cities and Ground Water Users

1) The long-standing Cities' expert, Greg Sullivan, will be out of the country between May 17 and June 2, 4 days before the scheduled hearing. These dates include the date when expert reports are due, which means Mr. Sullivan will have to prepare his report in the middle of discovery and will have no opportunity to review other expert reports until he returns. The Declaration of Greg Sullivan

filed herewith contains further details as to why a continuance is necessary and are incorporated herein. Mr. Sullivan's absence will prejudice the Cities ability to adequately prepare for hearing.

2) Ms. McHugh will be out of town during the week of the hearing and this compromises her ability to adequately represent her clients causing them prejudice. (Declaration of Candice McHugh)

3) Sophia Sigstedt has been a long-standing expert for the Idaho Ground Water Appropriators and participated in the SWC Technical Working Group. She is IGWA's modelling expert with expertise in surface and ground water interactions, hydrogeology, consumptive use analysis among others. As detailed her in Declaration filed in support of this Motion, she is not able to "perform all of the work required to properly analyze" the orders in this case. Declaration of Sophia Sigstedt at 5. Furthermore, and most significantly, Ms. Sigstedt is not available for the hearing as schedule because of medical reasons. Id. Ms. Sigstedt's testimony and expertise is material to the development of the record and issues raised by IGWA. IGWA will be severely prejudiced if she is not able to attend the hearing.

4) Jaxon Higgs is an expert for the IGWA as a Geologist and Hydrologist and has expertise with issues relevant to this matter including groundwater modelling, the technical working group that was a pre-cursor to the orders in this matter, and water measurement, aquifer recharge and management to name a few. Mr. Higgs is unavailable the week of the hearing, due to an out of country trip already scheduled. Declaration of Jason Higgs. Mr. Higgs' testimony is material to the

development of the record and issues raised by IGWA. IGWA having to hire a different expert to present the testimony is not possible at this late date and replacing his expertise will require significant additional expense for another expert which is not necessary. IGWA will be severely prejudiced if he is not able to attend the hearing.

The availability of these people before and/or during the hearing will cause prejudice to their respective client's real property interests and rights to due process.

B. Insufficient time to obtain, review, and develop evidence and legal argument for Bonneville- Jefferson's experts and legal counsel.

The scheduled hearing date does not provide adequate time for Bonneville-Jefferson's experts to obtain, review, and develop testimony regarding the relevant information in this matter. Bonneville-Jefferson has retained Bryce Contor and Thane Kindred from Rocky Mountain Environmental Associates, Inc., in Idaho Falls, Idaho, to review the technical information pertaining to the Fifth Amended Methodology Order and April 2023 As-Applied Order. Their expertise is critical to Bonneville-Jefferson's opposition to these orders because Bonneville-Jefferson and its retained experts were not involved in the Department meetings or discussions regarding the technical basis for either Order. See Declaration of Skyler C. Johns, Declaration of Bryce Contor, and Declaration of Thane Kindred. Thus, Bonneville-Jefferson and its experts have not received, nor do they have access to any information the Department relied upon in these orders as of the date of this filing. Id. Once all discovery is complete, Bryce Contor and Thane Kindred require at least two months to adequately review the information and prepare their testimony regarding the technical basis of the Orders.

Counsel for Bonneville-Jefferson also cannot adequately develop evidence or legal arguments in opposition to the Orders until Bryce and Thane complete their review. Id. As such, counsel will require an additional one to two months to consult with Bonneville-Jefferson's experts once they have completed their review of all the relevant information. See Declaration of Skyler C. Johns.

Based on the foregoing, not granting additional time for Bonneville-Jefferson to obtain review and evidence and legal arguments will cause prejudice to its members real property interests and rights to due process.

C. Mitigation Has Been Secured for the Upcoming Season, Thereby Causing Little to No Prejudice to the Senior Users

1) At the Pre-Hearing conference, the Director denied the continuance but left the door open, "if … water users as a whole, whose priority dates are junior to the senior water right holders, are either complying with a mitigation plan or have arranged somehow with the senior water right holders to satisfy the obligation, I'm willing to listen to some reasonable requests for delay." Tr. 24: 21- 25: 1.3.
2) IGWA has enough the water to mitigate for its 2021 breach and for the predicted demand shortfall for the upcoming 2023 season. See IGWA's Notice of Mitigation.
3) The Cities are in compliance with their mitigation obligations and will meet their obligations this year.
4) At least two other junior groundwater users, McCain Foods USA, Inc. ("McCain") and Amalgamated Sugar Company ("Amalgmated") are also mitigated for their use. See McCain Notice of Mitigation and Amalgamated's Notice of Mitigation.

5) It is also understood that IDWR is issuing curtailment letters to the remaining, non-mitigated juniors. These other remaining junior users account a fractional percentage of the groundwater depletions which are allegedly causing injury to Twin Falls Canal Company. It is anticipated that some of these users will also provide mitigation, but given the tiny amount of water they are responsible for, the fact that IGWA has enough water for this season to offset the entire injury forecasted to TFCC and the fact that the Cities' have over-mitigated in the past several years, the Director should consider that the junior water users "as a whole" are complying with mitigation plans. Thus, a reasonable continuance is in order.

6) This leaves the final piece—that the Director effectively delegated to the SWC the ability to veto a continuance to a reasonable hearing date. Tr: 24:21-25: l. 3. The Parites are unaware of any statutory authority for this action, and in fact it appears the Director is attempting to set a hearing that will end up with a per se inadequate record for appeal.

In addition, because mitigation water has been secured and the Director has a final Fourth Methodology order administration can occur this year. And, while the Parties to this motion prefer to wait for implementation of the 2023 Orders, they will not object to the Director implementing the 2023 Orders and pursuing curtailment of non-mitigated groundwater users this season.

D. Experts and Counsel Involved Here Are Available For A Hearing in This Matter the Week of October 16, 2023 And the Moratorium Hearing Could be Rescheduled

Over a dozen attorneys and/or experts for the key parties in this matter and twenty-four parties are the same as those in *The Matter of the Big Wood River Ground Water Management Area and In The Matter of Applications for Permit for the Diversion and Sue of Surface and Grud Water Within the Snake Rier Basin* (the "Moratorium Matters"). There is a hearing set for October 16-19, 2023 at the Department in Moratorium Matters. The overlapping parties, counsel and experts in the Moratorium Matters and this action are: 14 cities in the Coalition of Cities and their attorneys Candice McHugh, Chris Bromley, the City of Pocatello and its attorney Sarah Klahn and the City of Idaho Falls and its attorney Rob Harris along with their collective expert Greg Sullivan; Idaho Ground Water Appropriators and its nine groundwater districts and its attorneys Thomas J. Budge, Elisheva Patterson, and its experts Sophia Sigstedt and Jaxon Higgs; Kent Fletcher, Travis Thompson and John Simpson.

The City of Bellevue, the City of Pocatello, the Coalition of Cities, Wellsprings Group and IGWA all agree to move the hearing in this matter to the days set for hearing in the Moratorium Matters. And, because Mr. Fletcher, Mr. Thompson and Mr. Simpson represent parties in the Moratorium Matters that are all in support of the Moratoriums, which is in place, moving that hearing will not prejudice their clients.

Moving this hearing to the proposed October dates or some other week in this coming fall or early winter is a reasonable delay given the detail and evidence needed in this case. Because the key players are all available for the dates set forth in October, this seems like the easiest and fairest resolution, but regardless, delaying the hearing to dates this fall

allows a full and fair development of the record by all parties and it will allow the Director time to issue an order prior to having to determine carry-over storage issues in November and in time for the upcoming 2024 irrigation season.

E. Rescheduling the Hearing Saves All Parties and IDWR Time, Money and Expense and Honors the Civility and Professional Conduct of the Legal Profession

Without moving the hearing, the parties to this Motion will be forced to take action in District Court requiring IDWR and the other parties to the case to respond. It is a much more reasonable and prudent of use of state resources as well as resources of the parties to reschedule this hearing later this fall, especially because there are dates available in October for all the necessary parties, the senior user's forecasted injury will be fully mitigated this season and without a delay the junior users are highly prejudiced.

CONCLUSION

Based on the foregoing, the Parties to this Motion request that the Director grant a continuance to the Moratorium Hearing Dates in October or to some other week this fall; the Parties to this motion and their experts are also available the weeks of November 27 or December 6, 2023.

In addition, the Parties to this Motion recognize that the Surface Water Coalition has a right to respond to this motion but given the compressed hearing schedule, the Parties request that the Director order them to respond by the end of business Tuesday, May 9, 2023 and issue an order on this Motion by Wednesday, May 10, 2023.

Submitted this 5th day of May, 2023.

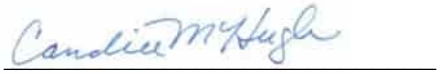
Attorney for the Coalition of Cities, Amalgamated Sugar Company and McCain Foods USA, Inc.

BEFORE THE DEPARTMENT OF WATER RESOURCES OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	**Docket No. CM-DC-2010-001** **DECLARATION OF CANDICE M. MCHUGH**

I, Candice McHugh hereby declare and state as follows:



1. I am over the age of 18 and state the following based upon my own personal knowledge.
2. I am one of two owners of McHugh Bromley, PLLC, the law firm that represents the cities that make up the Coalition of Cities as their interests relate to the on-going Surface Water Coalition ("SWC") Delivery Call and mitigation thereof. McHugh Bromley, PLLC also represents Amalgamated Sugar Company ("Amalgamated") and McCain Foods USA, Inc. ("McCain") in this matter.
3. McHugh Bromley, PLLC has two attorneys, Candice McHugh and Chris Bromley. We have one part-time file clerk who works 4-5 hours per week on clerical duties only.
4. I serve as the primary attorney for Amalgamated and McCain.

5. My partner, Chris Bromley, is the primary attorney for Sun Valley Company who is a party to the Supreme Court appeal in *South Valley Ground Water District and Galena Ground Water District v. Idaho Dep't of Water Resources*, Supreme Court Docket No. 49632-2022 ("Supreme Court Matter"). Oral argument in that matter is set for June 5, 2023 with Mr. Bromley set for argument. Mr. Bromley will be preparing for argument during the week of May 29, 2023.
6. I have a previously scheduled out of state obligation in Boone, North Carolina, to assist my son who is a freshman football athlete in college from June 4-8, 2023, wherein I will be travelling by air virtually all day June 4 and all day June 8, 2023.
7. Because our law firm only has two attorneys, requiring Mr. Bromley, alone to prepare for the Supreme Court argument while also having to do the bulk of the preparation for the SWC hearing on behalf of the Coalition of Cities, Amalgamated, and McCain at the same time and then represent our firm's clients in 4 days of hearing is not practical and does not allow us to fully and fairly represent Coalition of Cities, Amalgamated, and McCain.
8. After repeated requests to postpone the hearing to other dates by the junior users, IGWA, GWDs, McCain, Amalgamated, and the Cities, the Director denied their requests.
9. The hearing as currently set will not allow me to assist or attend the hearing in any meaningful manner and prejudices the interest of McHugh Bromley, PLLC's clients.

I declare under penalty of perjury under the laws of the State of Idaho that the foregoing is true and correct.

Dated this 5th, day of May, 2023.

MCHUGH BROMLEY, PLLC

/s/ *Candice M. McHugh*
Candice M. McHugh

BEFORE THE DEPARTMENT OF WATER RESOURCES

OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **ORDER DENYING THE CITIES' MOTION FOR APPOINTMENT OF INDEPENDENT HEARING OFFICER AND MOTION FOR CONTINUANCE AND LIMITING SCOPE OF DEPOSITIONS**

BACKGROUND

On April 21, 2023, the Director of the Idaho Department of Water Resources ("Department") issued his *Fifth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* ("Methodology Order") as well as his *Final Order Regarding April 2023 Forecast Supply* ("As-Applied Order"). The Methodology Order revises the nine steps used to determine material injury to members of the Surface Water Coalition ("SWC"). The As-Applied Order predicts a shortfall for the 2023 irrigation season, which will result in mitigation requirements or curtailment for ground water rights with priority dates junior to December 30, 1953.

Anticipating that one or more parties would request a hearing pursuant to Idaho Code § 42-1701A(3) in response to one or both of the orders, the Director also issued a *Notice of Hearing, Notice of Prehearing Conference, and Order Authorizing Discovery* ("Notice of Hearing") on April 21, 2023. The Notice of Hearing scheduled a prehearing conference for April 28, 2023, and an in-person evidentiary hearing on the Methodology Order and As-Applied Order for June 6–10, 2023.

Immediately before the April 28, 2023 prehearing conference, the Cities of Bliss, Burley, Carey, Declo, Dietrich, Gooding, Hazelton, Heyburn, Idaho Falls, Jerome, Paul, Pocatello, Richfield, Rupert, Shoshone, and Wendell (collectively the "Cities") filed a *Motion for Appointment of Independent Hearing Officer* ("Motion to Appoint") requesting that the Director appoint an independent hearing officer to preside over the hearing set for June 6–10, 2023. The Cities also filed a *Motion for Continuance*, asking the Director to continue the evidentiary hearing "until a date in December or January 2024 . . . ." Mot. for Continuance at 8.

The prehearing conference was held on April 28, 2023. During the prehearing conference, the Cities presented argument in support of their *Motion for Continuance*. The Idaho Ground Water Appropriators, Inc. ("IGWA"), Bonneville-Jefferson Groundwater District, and McCain Foods orally moved to join the Cities' *Motion for Continuance*. The SWC opposed the Cities' motion, arguing the hearing should remain as scheduled on June 6–10, 2023. The Director orally denied the Cities' request to delay the hearing until December or January 2024

but left open the possibility of moving the hearing dates to another week in June. This order memorializes the Director's oral ruling.

ANALYSIS

A. Motion for Continuance.

The Cities request that the hearing, currently scheduled for June 6–10, 2023, be delayed approximately six months. Mot. for Continuance at 8. The Cities assert additional time is needed to conduct discovery, prepare witnesses, properly evaluate the updated Methodology Order and As-Applied Order, and because one of its attorneys (Ms. Candice McHugh) will be unable to appear in person June 6–10. *Id.* at 4–6. The Cities further assert the Director should grant its request because no exigency exists given the above-average snowfall this year. *Id.* at 6–8.

During the April 28, 2023 prehearing conference, the Director orally denied the Cities' request to move the hearing to December or January 2024 but offered limited flexibility regarding the June hearing dates. The Director stated he was willing to move the hearing anytime within the first three weeks of June 2023 if all the parties agreed to move the hearing. In response to the Cities' claims of being surprised by the changes, the Director observed that last fall the Department conducted multiple presentations regarding possible amendments to the *Fourth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* ("Fourth Methodology Order"). The Director also reminded the parties he had, multiple times, publicly expressed his intention to revisit the Fourth Methodology Order. In denying the Cities' request, the Director emphasized his court-ordered obligation to timely predict water supplies and issue orders timely to ensure senior water right holders are protected. The Director reaffirms his denial of the Cities' *Motion for Continuance* but remains willing to move the hearing within the first three weeks of June 2023 if the parties file a stipulated motion requesting a change.[1]

B. Motion to Appoint an Independent Hearing Officer.

The Cities move the Director to appoint an independent hearing officer pursuant to Idaho Code § 42-1701A(2), which states in relevant part that "[t]he director, *in his discretion*, may direct that a hearing be conducted by a hearing officer appointed by the director." (Emphasis added). Accordingly, the Director has the discretion to grant or deny the Cities' request.

In support of the Motion, the Cities argue that "the only evidentiary hearing of any magnitude" in the SWC delivery call proceedings occurred in 2008 when former Idaho Supreme Court Chief Justice Gerald Schroeder was appointed to serve as a hearing officer. *Motion to Appoint* at 3–4. The Cities assert that the updated Methodology Order constitutes a "sea-change"

[1] At the April 28, 2023 prehearing conference, Ms. McHugh asked that she be allowed to participate in the hearing remotely if the Director was going to keep the June hearing date. The Director granted Ms. McHugh's request to appear at the hearing remotely in his *Scheduling Order and Order Authorizing Remote Appearance at Hearing* (issued May 2, 2023).

and that "the Methodology Order fails to update data as to SWC irrigation efficiencies, irrigation practices, irrigated area, among other topics that will need to be addressed at an evidentiary hearing with a fully developed record." *Id.* at 4. The Cities argue that it has been 15 years since "an evidentiary hearing of any consequence has taken place," and recommend that an independent hearing officer be appointed to hold this upcoming evidentiary hearing. *Id*. at 5. The Cities suggest the Department has established a "practice" of appointing an independent hearing officer in the SWC delivery call and encourages the Director to continue with this "practice." *Id*.

The Director declines to grant the Cities' request to appoint an independent hearing officer. The Director has held many evidentiary hearings related to conjunctive administration of water rights. For example, the Director held a multi-day evidentiary hearing in the Rangen delivery call matter. *See Rangen, Inc. v. Idaho Dep't of Water Res.*, 159 Idaho 798, 801, 367 P.3d 193, 196 (2016) ("IDWR Director Gary Spackman ('Director') presided over an evidentiary hearing."). The Director held a multi-day evidentiary hearing in the Basin 37 administrative matter. *See* Final Order, *In re Basin 37 Administrative Proceeding*, No. AA-WRA-2021-001 (Idaho Dep't of Water Res. June 28, 2021) (The Director presided over evidentiary hearing held June 7–12, 2021).

The Director has held evidentiary hearings related to mitigation plans in the SWC delivery call matter. *See* Am. Final Order Re. Compliance with Approved Mitigation Plan, *In re IGWA's Settlement Agreement Mitigation Plan*, No. CM-MP-2016-001 (Idaho Dep't of Water Res. April 24, 2023). Significantly, the Director has held an evidentiary hearing on previous updates to the methodology order. *See* Am. Final Order Re. Method. for Determ'g Material Injury to Reasonable In-Season Demand & Carryover.

These examples are just a few of the many administrative hearings the Director has held. As these examples illustrate, there is no fixed practice of appointing a hearing officer in this or other contested administrative matters. The Director has presided over many evidentiary hearings related to significant water administration issues and is able to preside over the upcoming evidentiary hearing.

Furthermore, time is of the essence given that the As-Applied Order predicts a shortfall for the 2023 irrigation season resulting in mitigation requirements or curtailment for ground water rights junior to December 30, 1953. The urgency for water administration mandates a timely decision because "[w]hen a junior appropriator wrongfully takes water that a senior appropriator is entitled to use, there is often the need for very prompt action." *Clear Springs Foods, Inc. v. Spackman*, l50 Idaho 790, 815, 252 P.3d 71, 96 (2011); *see also IGWA v. Idaho Dep't of Water Res*., No. CV27-22-00945 (Jerome Cnty. Dist. Ct. Idaho).

The Director is thoroughly familiar with all aspects of the Methodology Order and the As-Applied Order and is the person in the best position to preside over this matter and consider the arguments raised by the parties. Appointing an independent hearing officer would unreasonably delay the proceedings and delay administration of hydraulically connected surface and ground water rights.

C. Scope of Depositions of Department Employees

During the prehearing conference, the Director also identified Matthew Anders and Jennifer Sukow as the witnesses that will testify on behalf of the Department at the hearing to explain the facts and information the Department considered in updating the Methodology Order and As-Applied Order. Questions were raised regarding the appropriate scope of the depositions. As indicated at the prehearing, the deposition process is not an opportunity for parties to question Department employees about the Director's deliberative process related to legal and policy considerations. The Methodology Order clearly explains the Director's views regarding the legal and policy considerations on the issues like why the Director is updating the methodology order and steady-state vs. transient-state modeling. Rule 521 of the Department's Rules of Procedure states: "The presiding officer may limit the type and scope of discovery." IDAPA 37.01.01.521. Accordingly, the Director will limit the scope of the depositions to preclude questions regarding the Director's deliberative process on legal and policy considerations.

ORDER

Based on the forgoing discussion, IT IS HEREBY ORDERED that the Coalition of Cities' *Motion for Continuance* is DENIED. The Director will consider moving the hearing to other dates within the first three weeks of June 2023 if the parties file a stipulated motion requesting the change.

IT IS FURTHER ORDERED that the Coalition of Cities' *Motion for Appointment of Independent Hearing Officer* is DENIED.

IT IS FURTHER ORDERED that the scope of any deposition of a Department employee will preclude questions regarding the Director's deliberative process on legal and policy considerations.

DATED this 5th day of May 2023.

BEFORE THE DEPARTMENT OF WATER RESOURCES

OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **NOTICE OF MATERIALS DEPARTMENT WITNESSES MAY RELY UPON AT HEARING AND INTENT TO TAKE OFFICIAL NOTICE**

On May 2, 2023, the Director issued a *Scheduling Order and Order Authorizing Remote Appearance at Hearing* ("Scheduling Order"). In the Scheduling Order, the identified two Idaho Department of Water Resources ("Department") employees who will testify at the hearing—Jennifer Sukow and Matthew Anders. The Director set a deadline of May 5, 2023, for the Department to provide the materials Ms. Sukow and Mr. Anders may rely upon at the hearing as well as a summary of topics Ms. Sukow and Mr. Anders may testify to. *Scheduling Order* at 2. The Department may augment its list of materials Ms. Sukow and Mr. Anders may rely upon at the hearing, if needed, by May 10, 2023. *Id*.

A. Materials Ms. Sukow and Mr. Anders may rely upon during the June 6-10 hearing.

The materials Ms. Sukow and Mr. Anders may rely upon at the hearing have been divided into four separate folders and are publicly available on the Department's website[1] as a downloadable zipped file labeled "Materials Department Witnesses May Rely Upon at Hearing".

1st Folder: "2022 Technical Working Group ("TWG")". Presentations, agendas, data and communications related to the TWG meetings this fall.

2nd Folder: "2023 5th Amended Methodology Order". Data files and notes related to baseline year, irrigated acres, project efficiency, reasonable carryover.

3rd Folder: "2023 April As-Applied Order". Copies of all files in the April Background Information folder on IDWR's website.

4th Folder: "ESPAM Report". ESPAM documentation reports from Jennifer Sukow.

[1] The webpage for the above-captioned matter can be located at: https://idwr.idaho.gov/legal-actions/delivery-call-actions/SWC/.

B. Topics Ms. Sukow may testify about at the hearing:

- Steady-state vs. transient modeling / simulations for the Eastern Snake Plain Aquifer Model (ESPAM).
- Calculation of curtailment priority dates for the SWC's delivery call.

C. Topics Mr. Anders may testify about at the hearing:

- Base Line Year (BLY)
- Forecast Supply
- SWC Irrigated Acres
- Crop Water Need
- Near Real Time Mapping Evapo Transpiration at high Resolution with Internalized Calibration (NRT METRIC)
- Project Efficiency
- Reasonable Carryover
- Twin Falls Canal Company's increase in diversions
- The 2023 Technical Working Group meetings

D. Director's intent to take official notice.

Department Rule of Procedure 602 states in pertinent part:

> The [Director] may take official notice of any facts that could be judicially noticed in the courts of Idaho, of generally recognized technical or scientific data or facts within the agency's specialized knowledge and records of the agency. The [Director] may ask agency staff to prepare reports or memoranda to be used in deciding a contested case, and all such reports and memoranda shall be officially noticed by the [Director]. The [Director] shall notify the parties of specific facts or material noticed and the source of the material noticed, including any agency staff memoranda and data. This notice should be provided either before or during the hearing, and must be provided before the issuance of any order that is based in whole or in part on facts or material officially noticed. Parties must be given an opportunity to contest and rebut the facts or material officially noticed.

IDAPA 37.01.01.602.

The Director hereby notifies the parties that he intends to take official notice of the facts and data in the "2022 Technical Working Group ("TWG")" folder, "2023 5th Amended Methodology Order" folder, "2023 April as Applied Order folder", and "ESPAM Report" folder.

Concurrent with this notice, copies of those documents will be posted to the Department's docket for this proceeding. Pursuant to Rule of Procedure 602, any party may file a written objection "to contest and rebut the facts or material to be officially noticed" on or before June 4, 2023. IDAPA 37.01.01.602.

DATED this 5th day of May 2023.

Gary Spackman
Director

DEPARTMENT OF WATER RESOURCES

IN THE MATTER OF THE DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY AND FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **Declaration of Jaxon Higgs**

I, Jaxon Higgs, declare the following:

1. I am over the age of 18 and competent to testify. If called upon to testify, I could testify to the following, all of which are within my own personal knowledge or based upon my professional judgment.

2. I am a licensed professional Geologist in the State of Idaho. I have a bachelor's degree in Geology from Brigham Young University Idaho and a master's degree in Hydrology from the University of Idaho.

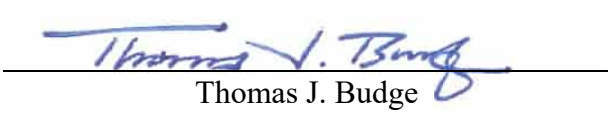
3. I am the principal owner and operator of Water Well Consultants ("WWC"), an Idaho corporation with its principal address at 355 W. 500 S., Burley, Idaho 83318. WWC provides a variety of hydrogeologic services in southern Idaho related to aquifer management and water conservation. Contracted duties include, but are not limited to, monitoring of aquifer health, usage measurement and reporting, and management of aquifer recharge programs.

4. I am a consultant for Idaho Ground Water Appropriators, Inc. ("IGWA"). In that capacity I provide technical assistance on a variety of matters, including groundwater modelling and other issues related to the Surface Water Coalition ("SWC") delivery call.

5. From November 16 to December 21, 2022, I participated in several Technical Working Group meetings with the Idaho Department of Water Resources ("Department") staff via virtual meetings, to review the *Fourth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* ("Fourth Methodology Order") and the Department staff's findings. The information covered during these Technical Working Group meetings was complex and voluminous.

6. I have reviewed and consulted with IGWA concerning the *Fifth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* ("Fifth Methodology Order") issued by the Director on April 21, 2023, and will be involved in reviewing the Fifth Methodology Order, analyzing data, and preparing expert reports.

7. My family has a long-standing road trip vacation to Mexico planned for May 27-June 10, 2023. Therefore, I am unable to participate in the hearing currently scheduled for June 6-10, 2023.



I declare under the penalty of perjury pursuant to the law of the State of Idaho that the foregoing is true and correct.

DATED this 4th day of May, 2023.

Attorneys for Idaho Ground Water Appropriators, Inc. (IGWA)

STATE OF IDAHO

DEPARTMENT OF WATER RESOURCES

IN THE MATTER OF THE DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY AND FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **Declaration of Sophia Sigstedt**

I, Sophia Sigstedt, declare the following:

1. I am over the age of 18 and competent to testify. If called upon to testify, I could testify to the following, all of which are within my own personal knowledge or based upon my professional judgment.

2. I am an American Institute of Hydrology Professionally Certified (No. 7015) Hydrogeologist with a specialization in groundwater. I have a master's degree in hydrology from the New Mexico Institute of Mining and Technology. My work includes hydrogeology, water resources engineering, and water resources planning and management. I have directed or contributed to several river-basin-scale water management studies that involved analysis of basin hydrology and water uses and the development of computer models to investigate implications of changes in hydrology, system operations, and water uses. My experience includes historical consumptive use analysis, evaluation of surface and ground water interactions, development of

protective terms and conditions for water users, settlement negotiations and expert witness testimony. I am employed by Lynker Technology, 5445 Conestoga Court, Suite 100, Boulder, Colorado.

3. For several years I have worked as a technical consultant for Idaho Ground Water Appropriators, Inc. ("IGWA"). In that capacity I participate on the Eastern Snake Plain Hydrologic Modeling Committee, the Big Lost Modeling Technical Advisory Committee, and the Swan Falls Technical Working Group, and have testified as an expert witness in cases before the Idaho Department of Water Resources ("IDWR" or "Department"). I further provide IGWA with technical assistance on a variety of matters, including the Surface Water Coalition ("SWC") delivery call.

4. From November 16 to December 21, 2022, I participated in several virtual meetings held by Department staff regarding the *Fourth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* ("Fourth Methodology Order") issued in the SWC delivery call case. Department staff had been reviewing the components of the methodology used to determine material injury to the SWC and related matters. The data shared during these meetings were highly technical, complex and voluminous.

5. On December 23, 2022, I received from Department staff a one-page summary of their "preliminary recommendations on potential technical changes to the methodology." This document requested written comments be submitted by January 16, 2023.

6. I drafted and submitted to Department staff my preliminary comments to the preliminary recommendations, and comments addressing the other material covered during the November and December Technical Working Group meetings, on January 16, 2023.

7. On April 21, 2023, the Director issued the *Fifth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* ("Fifth Methodology Order"). Based on my review of the Fifth Methodology Order, it does not appear that the Director took into consideration my written comments submitted on January 16, 2023.

8. Step 1 of the Fifth Methodology Order is the analysis of SWC's total anticipated irrigated acres for the upcoming year. As with prior versions, the Fifth Methodology Order requires the SWC to annually submit either an electronic shapefile delineating total irrigated

acres within their delivery system, or confirm in writing that the acreage submitted previously has not varied by more than five percent. During the technical meetings, Department staff reported that they examined the number of acres irrigated within Twin Falls Canal Company (TFCC) as a check against the acres reported by TFCC. The Department found 179,456 irrigated acres, whereas TFCC reported 194,732 irrigated acres. This is a more than 9% difference, and it exceeds the 5% standard set in the Fifth Methodology Order. A proper evaluation of the Fifth Methodology Order requires consideration of the accuracy of SWC's reported irrigation acreage, which has not been addressed by the Department. In order to properly analyze Step 1 of the Fifth Methodology Order, I want to analyze the most up-to-date real-time METRIC data to audit the number of acres of acres actually irrigated within TFCC and other members of the SWC. The June 6, 2023, hearing date does not allow me sufficient time to perform this analysis.

9. Step 2 of the Fifth Methodology Order requires the Director to compare the April Forecast Supply (FS) to the Baseline Demand (BD) for each SWC entity to determine if an in-season demand shortfall (IDS) is predicted for the upcoming irrigation season. To calculate FS, the Fourth Methodology Order used the Heise natural flow data and in some cases Box Canyon spring discharge from years 1990-2022. IDWR staff reported in a presentation on November 17, 2022, that the R^2 value for the TFCC FS model has degraded continually since the Fourth Methodology Order was issued, which creates significant problems with the reliability of the method used to predict FS. It is also significant that the R^2 value for TFCC, which is often the only SWC entity with a predicted DS, is the lowest R^2 value among the SWC members. In order to properly analyze Step 2 of the Fifth Methodology Order, I want to analyze previously tested FS predictors over the new period of record (POR) 1990-2022, as well as cast a new net of predictor variables that may have higher explanatory power than the current model. The June 6, 2023, hearing date does not allow me sufficient time to properly evaluate and analyze the data.

10. One of the most significant changes to the Fifth Methodology Order is the transition from a three-year composite Base Line Year (BLY) to a single-year BLY. The methodology uses the BLY to calculate Reasonable In-Season Demand (RISD) for each SWC entity in Steps 2, 6, 7 for Demand Shortfall and Step 9 Reasonable Carryover The Fourth Methodology Order used average diversion volumes in 2006, 2008, and 2012 as the BLY. The Fifth Methodology Order uses only 2018 diversions as the BLY. Average diversions in 2006/2008/2012 (06/08/12) ranked between 7th and 8th highest for diversions, or about the 55th percentile (based on a normal

distribution), for the period of record (POR) 2000-2015. For the POR 2000-2021 the diversion demand for 2018 ranks 3rd, or about the 90th percentile (based on a normal distribution) for the POR. When I compared the distribution of SWC total diversion demands for the POR 2000-2015 compared to 2000-2021, it is apparent that they are very similar with mean diversions of 3.16 million acre-feet and 3.2 million acre-feet, respectively. The standard deviation is also very similar for the POR 2000-2015 compared to 2000-2021 at 178,089 acre-feet and 178,587 acre-feet, respectively. Without evidence that the previous BLY created unmitigated shortages to the SWC, there is not an adequate technical basis to support 2018 as an appropriate BLY. In order to properly evaluate the Fifth Methodology Order, I would need to analyze if there are more appropriate BLY alternatives, and further evaluate the unique hydrologic circumstances in 2018 (i.e. precipitation and water operations) to better establish an appropriate BLY recommendation. I am unable to properly evaluate and analyze this data by the June 6, 2023, hearing date.

11. The RISD calculation applied in Steps 6 and 7 is a function of Crop Water Need (CWN) and Project Efficiency (PE). The inaccuracy of reported irrigated acres for TFCC of more than 15,000 acres will result in an inaccurate determination of CWN. I would want to further analyze and quantify the impact the error of including non-irrigated acres in the calculation of CWN has on the RISD calculation. The June 6, 2023, hearing date does not allow me to properly evaluate and analyze this data.

12. In the Fifth Methodology Order, the Director now finds that averaging over a rolling period of 15 years results in project efficiency that is more appropriate than the previous eight-year average. Project efficiency is a complex component of the Fifth Methodology Order to evaluate as it is a function of seepage or conveyance loss, on-farm application losses (deep percolation, field runoff), and system operational losses (return flows). Information reported by Department staff indicated that there is higher uncertainty in the April and October efficiency values which would result in errors in the determination of RISD. Data also showed the project efficiency among SWC entities are almost all flat or declining (6 out 7 entities), which is contrary to what would be expected with technology advancements and constrained water supplies. Data presented to the TWG also included scatter plots by SWC entity comparing Annual Crop Water Need to Annual Diversions that show Crop Water Need is limited as a predictor given the low explanatory power indicated by the low R^2 values in the analysis. I want

evaluate and analyze these apparent contradictions and uncertainties. The June 6, 2023 hearing date does not allow me to properly evaluate and analyze this data.

13. Step 3 of the Fifth Methodology Order uses the Eastern Snake Plain Aquifer Model (ESPAM) to predict the junior priority water rights that must be curtailed to produce the volume of water equal to the predicted April DS in the Blackfoot to Minidoka reach. In the Fifth Methodology Order, the Director now finds that transient simulations are necessary to evaluate the impacts of aquifer stresses. The November 28, 2022, presentation by IDWR staff showed a huge difference in resulting determination of the curtailment priority date if a steady state vs. transient model is applied. Under a transient model application, any DS above ~100,000 acre-feet would result in essentially aquifer-wide curtailment. IDWR staff have understood the difference between a transient model and steady state model at least since my involvement began in this case in 2015, so it is difficult to understand what caused the Director to make this change to methodology at this time, especially given the Department staff did not make a recommendation on this topic. During the technical presentations by IDWR staff in November/December 2022, IDWR staff were unable to explain why the change was being evaluated at this time. In order to properly evaluate this change to the methodology, I want to conduct a hindcast analysis using the transient application of ESPAM over all the preceding years to 2023 the Methodology Order has been applied. The June 6, 2023 hearing date does not allow me to properly evaluate and analyze this data.

14. I am unable to perform all of the work required to properly analyze the Fifth Methodology Order before the hearing scheduled for June 6-10, 2023. I estimated that I would need until October to complete this work.

15. I presently have a medical condition that leaves me unable to leave my home state of Colorado, until July 10, 2022. Therefore, I am not able to travel to Idaho for a hearing June 6-10, 2023. My condition further limits the amount of work I am able to perform during this time.

(Remainder of page intentionally left blank)

I declare under the penalty of perjury pursuant to the law of the State of Idaho that the foregoing is true and correct.

DATED this 4th day of May, 2023.

Sophia C. Sigstedt

BEFORE THE DEPARTMENT OF WATER RESOURCES

OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **MOTION FOR RECONSIDERATION**

COME NOW, the Cities of Bliss, Burley, Carey, Declo, Dietrich, Gooding, Hazelton, Heyburn, Jerome, Paul, Richfield, Rupert, Shoshone, and Wendell ("Coalition of Cities"), by and through their attorneys of record, Candice M. McHugh and Chris M. Bromley, the City of Idaho Falls, by and through its attorney of record, Robert L. Harris, and the City of Pocatello by and through its attorney of record Sarah A. Klahn (collectively the "Cities"), the Idaho Ground Water Appropriators ("IGWA"), Bingham Ground Water District,

Bonneville-Jefferson Ground Water District (collectively the "Groundwater Users"), and pursuant to IDAPA 37.01.01.711 of the Department's rules of procedure and hereby move for reconsideration of the Director's April 21, 2023 *Fifth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand* ("Methodology Order") and *Reasonable Carryover* and *Final Order Regarding April 2023 Forecast Supply (Methodology Steps 1-3)* ("As-Applied Order"), (collectively the "2023 Orders").

INTRODUCTION

On April 21, 2023, at 6:45 p.m., the Director caused to be served on the parties to the Surface Water Coalition ("SWC") delivery call the above-referenced orders.[1] This Motion asks the Director to reconsider his finding of material injury of 75,200 acre-feet to Twin Falls Canal Company ("TFCC") based on the fact that if the irrigated acres for TFCC that was discussed during the Technical Working Group ("TWG") were used in the 2023 Orders, the Director would not have found material injury.

ARGUMENT

According to the Idaho Supreme Court, when the Director uses a baseline methodology for considering and determining material injury:

> the Director has the duty and authority to consider circumstances when the water user is not irrigating the full number of acres decreed under the water right. If this Court were to rule the Director lacks the power in a delivery call to evaluate whether the senior is putting the water to beneficial use, we would be ignoring the constitutional requirement that priority of water be extended only to those using the water.

A&B v. Idaho Dept. of Water Res., 155 Idaho 640, 652, 315 P.3d 828, 840 (2013) (emphasis added).

[1] The 2023 Orders were not served until 6:45 p.m. Because of this the fourteen-day period to file for reconsideration should run until May 8, 2023. In an abundance of caution, the Groundwater Users are filing this *Motion for Reconsideration* on May 5, 2023, which will be timely supplemented with a technical declaration on May 8, 2023.

According to the *Methodology Order*, members of the SWC are required to "submit electronic shape files to the Department delineating the total anticipated irrigated acres for the upcoming year within their water delivery boundary or confirm in writing that the existing electronic shape file submitted by SWC has not varied by more than five percent." *Methodology Order* at 39. According to the *As-Applied Order*, on March 10, 2023, "the Department received a letter from . . . Twin Falls Canal Company . . . stating that their total number of acres for 2023 will not vary by more than five percent from the electronic shapefiles submitted in prior years." *As-Applied Order* at 1. The total number of irrigated acres for TFCC was calculated as "194,732." *Id*. at 2. The number of irrigated acres is critical in the *Methodology Order* because acres are used as an input in the Director's quantification of material injury.

As the Director is aware, the SWC delivery call was commenced in 2005. In the intervening eighteen years, the number of irrigated acres has changed. For instance, in 2008, Hearing Officer Gerald Schroeder stated that TFCC claimed it was irrigating "196,162 acres," and that IGWA had identified "at least 6,600 acres claimed by TFCC in its district are not irrigated." *Opinion Constituting Findings of Fact, Conclusions of Law and Recommendation* at 9, 53 (Apr. 29, 2008). The Director acknowledged the same: "Estimates of irrigated acres from the hearing show a trend of decreasing irrigated acres. According to the Hearing Officer, beneficial use cannot occur on acres that have been hardened or are otherwise not irrigated." *Methodology Order* at 8. Despite these findings and statements, the number of irrigated acres asserted by TFCC has changed very little considering population growth and hardening of acres in Twin Falls County.

When questioned at the April 28, 2023 *Pre-Hearing Conference* why he was proceeding

so quickly to curtail junior ground water users with no time given to develop a record that would account for changes over the last eighteen years, the Director stated that factual issues should have been raised with the TWG:

> So again, I understand your arguments, but I have little sympathy for them at this point in time. . . . . And I guess I could present facts about the time period within which the facts that you're talking about and the preparation and presentations to the Department took a period of time, but there's also been a period of time of four months, I think, since the last presentation by Department staff to the technical working group, and within which the experts and the parties anticipating the issuance of a Methodology Order certainly could have been preparing for the inevitable.

Pre-Hearing Conference Transcript p. 25:18-25; p. 26:1-2 (emphasis added).

In fact, the irrigated area for TFCC was discussed during a TWG meeting on December 21, 2022. During that meeting, IDWR provided the participants with the findings that TFCC is irrigating 180,956 acres. The Director should have used the TWG irrigated acres in his determination of injury – certainly that is what the TWG participants were anticipating. If he had done so, the reduction in demand would be as follows:

TFCC Acres	
Methodology:	194,732 acres (Fifth Methodology Order at 10)
NRT Metric:	180,956 acres (12/21/2022 IDWR Presentation to TWG at 19)
Difference:	13,776 acres

TFCC Average CIR: 2.2 AF/ac (IDWR Spreadsheet - DS RISD Calculator_2022_August 15.xslx; Tab: "Crop Water Need)

TFCC Average PE: 35% (Fifth Methodology Order at 14)

Demand Reduction = (13,776 acres x 2.2 AF/ac) / 0.35

Demand Reduction = **86,600 AF**

Declaration of Greg Sullivan.[2]

[2] As stated in footnote 1, and because of when IDWR served the 2023 Orders, the *Declaration of Greg Sullivan* will be filed on May 8, 2023.

The reduction in TFCC's diversion demand of 86,600 acre-feet is computed using the reduction in TFCC acres indicated by IDWR's NRT Metric analysis, which is greater than the predicted 2023 diversion shortage for the TFCC in 2023 of 75,200 acre-feet. In other words, if IDWR's analysis to remove the non-irrigated acres in the TFCC service area is used in the *2023 Orders*, there would be no predicted shortage to the TFCC in 2023.

CONCLUSION

Idaho's prior appropriation doctrine does not condone curtailment for acres that are not irrigated. Because the Director's quantification of material injury was based on flawed data, material injury should not have been predicted. The prediction of material injury has forced the Groundwater Users to secure mitigation that they otherwise would not have been required to obtain. Based on the foregoing, the Groundwater Users request that the Director reconsider his finding of material injury to TFCC based on the fact that if he used the irrigated area that was discussed during the TWG, no injury would have been calculated.

Submitted this 5th day of May, 2023.

Attorneys for Bonneville-Jefferson Ground Water District

STATE OF IDAHO

DEPARTMENT OF WATER RESOURCES

IN THE MATTER OF THE DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY AND FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **DECLARATION OF BRYCE CONTOR IN SUPPORT OF MOTION FOR RECONSIDERATION OF DENIAL OF CONTINUANCE**

I, BRYCE CONTOR, under penalty of perjury, make this *Declaration in Support of Motion for Reconsideration of Denial of Continuance.*

1. I am over the age of eighteen (18) and competent to testify in this matter. I make this declaration based upon my own personal knowledge unless otherwise stated.

2. I am currently a senior hydrologist at Rocky Mountain Environmental Associates Inc. in Idaho Falls, Idaho (hereafter "Rocky Mountain"). I have an associate degree in farm crops management from Brigham Young University – Idaho, a Bachelor of Science degree in

agricultural economics from Bingham Young University – Provo, Utah, and a master's degree in hydrology from the University of Idaho. I am published in the Journal of the American Water Resources Association, in Irrigation and Drainage and as a junior author in the American Journal of Agricultural Economics.

3. I began working in water resources in 1996, with Idaho Department of Water Resources (hereafter "IDWR"). I performed flow measurements, field examinations of beneficial use, GIS mapping of water-right places of use and points of diversion, and prepared water-right recommendations for the Snake River Basin Adjudication.

4. Beginning in 200, I left IDWR for the Idaho Water Resources Research Institute (within University of Idaho) where I worked on water budgets for aquifer modeling, groundwater/surface-water interaction, and some water economics work. In 2010, I transitioned gradually into the private sector, working part-time for the University and part-time for Rocky Mountain Environmental Associates.

5. Currently I work full time at Rocky Mountain after almost three years of limited involvement while working with the Henry's Fork Foundation and Friends of the Teton River.

6. Bonneville-Jefferson Ground Water District (hereafter "Bonneville-Jefferson") retained the services of Rocky Mountain to assist the district and its legal counsel with technical matters affecting the litigation in the above-captioned matter. I consult frequently with the district and its legal counsel, and I have personal knowledge of the matters involved in the above-captioned matter.

7. I understand that the Director of the Idaho Department of Water Resources (hereafter "Director") changed the methodology used to calculate injury to the Surface Water Coalition (hereafter "SWC") in his 5th Amended Methodology Order issued on April 21, 2023. I

also understand that the Director issues the April 2023 As-Applied Order on April 21, 2023, and that the new methodology used in the As-Applied Order calculated a material injury of 75,200-acre feet to SWC. I understand that the As-Applied order calculates a curtailment date of 1953 for groundwater users. I further understand that the Director intends to hold an evidentiary hearing on both these orders beginning on June 6, 2023.

8. In my professional opinion, I do not have time to perform an adequate technical review of the technical information requested from IDWR in this litigation in order to properly testify at hearing. The primary reason for this is that I was never invited to deliberations of the technical working group that advises on technical issues related to the SWC/IGWA Settlement Agreement. I have not received any work products or documentations of decisions or recommendations of that group. I presently do not have access to all the documents and data that I would need to do a defensible technical review of the 5th Methodology Order.

9. I understand that there will be depositions of IDWR personnel late in the middle of May 2023, and that documents and data will be requested. If all those documents and data are produced, the earliest I expect to receive them would be around Monday, May 22, 2023. Even assuming that I could continue technical work on the morning of June 6, that would only give 15 days. If there is a delay in providing the materials, the window would be even shorter.

10. As such, I will be unable to perform comprehensive review and consult with and prepare legal counsel for Bonneville-Jefferson prior to the scheduled hearing date. It is my opinion that I would need at least two months to adequately review and prepare myself and counsel for the hearing.

11. Further your declarant saith not.

DATED this the 5th day of May 2023.

/s/ Bryce Conton

Attorneys for Bonneville-Jefferson Ground Water District

STATE OF IDAHO

DEPARTMENT OF WATER RESOURCES

IN THE MATTER OF THE DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY AND FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **DECLARATION OF SKYLER C. JOHNS IN SUPPORT OF MOTION FOR RECONSIDERATION OF DENIAL OF CONTINUANCE**

I, SKYLER C. JOHNS, under penalty of perjury, make this *Declaration in Support of Motion for Reconsideration of Denial of Continuance.*

1. I am over the age of eighteen (18) and competent to testify in this matter. I make this declaration based upon my own personal knowledge unless otherwise stated.

2. I am an attorney for the Bonneville-Jefferson Ground Water District (hereafter "Bonneville-Jefferson") in the above-captioned matter, and I have personal knowledge of the matters involved in these legal proceedings.

3. Bonneville-Jefferson has retained Rocky Mountain Environmental Associates, Inc. (hereafter "Rocky Mountain"), to review and advise me on technical matters involved in the above-captioned matter, including matters pertaining the Surface Water Coalition (hereafter "SWC") water delivery call against the Idaho Ground Water Appropriators (hereafter "IGWA").

4. On April 21, 2023, the Director of the Idaho Department of Water Resources (hereafter "Director") changed the methodology used to calculate injury to the SWC in his 5th Amended Methodology Order. The Director also the April 2023 As-Applied Order on April 21, 2023, and the new methodology used in the As-Applied Order calculated a material injury of 75,200-acre feet to SWC.

5. Prior to issuing these orders, I never received formal notice from the Idaho Department of Water Resources (hereafter "IDWR") that the Director would transition from Steady State to Transient State analysis as a tool to calculate material injury to SWC. To my knowledge, the Director never conducted a hearing prior to changing the methodology order. Neither myself, nor the experts who advise me from Rocky Mountain, were involved in any work group or discussions pertaining changes in the methodology order.

During the preliminary hearing held on April 28, 2023, I, on behalf of Bonneville-Jefferson, joined in support of the Motion to Continue filed by the Coalition of Cities to continue the evidentiary hearing set for June 6, 2023. I also expressed my concerns that Bonneville-Jefferson would not have sufficient time to obtain and review relevant information with its experts, and that would impair Bonneville-Jefferson's ability to adequately review relevant information and develop evidence opposing the Orders before the scheduled hearing date. The Director, however, did not continue the hearing.

6. In my professional opinion, I do not have time to perform an adequate review of the

information requested from IDWR in this litigation in order to properly prepare for the June 6, 2023, hearing. I further do not have adequate time to consult with my experts from Rocky Mountain regarding their review of the information requested from IDWR, nor do I have adequate time to prepare them to testify at the June 6, 2023, hearing. This will impair my ability to develop evidence and legal arguments in opposition to the Orders if the hearing continues as scheduled.

7. As of the date of this declaration, I have not received any work products or documentations of decisions or recommendations from any technical working group as referenced by the Director during the April 28, 2023, preliminary hearing. I presently do not have access to all the documents and data that I would need to review and prepare a defensible legal argument to the 5th Methodology Order.

8. Given the time limitations specified by the Director in his Scheduling Order, I must prepare for depositions of IDWR staff without having access to any of the documents that were relied upon by IDWR. Depositions will occur on May 10 and 12, 2023. I will be unable to adequately prepare effective questions for the deponents as I likely will not have access to any relevant documents or other information prior to these depositions.

9. As such, I will be unable to perform comprehensive review and consult with and prepare legal counsel for Bonneville-Jefferson prior to the scheduled hearing date. It is my opinion that I would need at least 6 months to adequately review and prepare myself and counsel for the hearing.

10. Based upon my knowledge and experience, not granting additional time for Bonneville-Jefferson to obtain review and evidence and legal arguments will cause prejudice to my client's real property interests and rights to due process.

11. Further your declarant saith not.

DATED this 5th day of May 2023.

OLSEN TAGGART PLLC

Attorneys for Bonneville-Jefferson Ground Water District

STATE OF IDAHO

DEPARTMENT OF WATER RESOURCES

IN THE MATTER OF THE DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY AND FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **DECLARATION OF THANE KINDRED IN SUPPORT OF MOTION FOR RECONSIDERATION OF DENIAL OF CONTINUANCE**

I, THANE KINDRED, under penalty of perjury, make this *Declaration in Support of Motion for Reconsideration of Denial of Continuance*.

1. I am over the age of eighteen (18) and competent to testify in this matter. I make this declaration based upon my own personal knowledge unless otherwise stated.

2. I am currently a staff geologist at Rocky Mountain Environmental Associates Inc. in Idaho Falls, Idaho (hereafter "Rocky Mountain"). Before starting at Rocky Mountain as a staff geologist, I received my Bachelor of Science degree in geology from Brigham Young University in Provo, Utah, and my master's degree from Idaho State University in Pocatello, Idaho.

3. Bonneville-Jefferson Ground Water District (hereafter "Bonneville-Jefferson") retained the services of Rocky Mountain to assist Bonneville-Jefferson and its legal counsel with technical matters affecting the litigation in the above-captioned matter. I consult frequently with the district and its legal counsel, and I have personal knowledge of the matters involved in the above-captioned matter.

4. I understand that the Director of the Idaho Department of Water Resources (hereafter "Director") changed the methodology used to calculate injury to the Surface Water Coalition (hereafter "SWC") in his 5th Amended Methodology Order issued on April 21, 2023. I also understand that the Director issues the April 2023 As-Applied Order on April 21, 2023, and that the new methodology used in the As-Applied Order calculated a material injury of 75,200-acre feet to SWC. I further understand that the Director intends to hold an evidentiary hearing on both these orders beginning on June 6, 2023.

5. In my professional opinion, I will not have time to fully understand the 5th Amended Methodology Order issued by the Director and perform a comprehensive technical review of it to be prepared for June 6th. I was not invited to any sort of Technical Working Group with IDWR concerning the Methodology Order. Similarly, I received no other indication (i.e., letter, email, etc.) that the Methodology Order would change prior to April 21 when it came out. As such, I do not currently have access to many of the documents and data that I would need to perform the analysis.

6. I understand that Depositions so far will be held in the middle of May 2023, but they will likely not produce documents until after the depositions occur, which only provides about two weeks for a technical review of all information before the date of the hearing.

7. As such, I will be unable to perform comprehensive review and consult with and

prepare legal counsel for Bonneville-Jefferson prior to the scheduled hearing date. It is my opinion that I would need at least two months to adequately review and prepare myself and counsel for the hearing.

8. Further your declarant saith not.

DATED this the 5th day of May 2023.

/s/ Thane Kindred

ATTORNEYS FOR THE CITY OF POCATELLO

IDAHO DEPARTMENT OF WATER RESOURCES

IN THE MATTER OF THE DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY AND FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **DECLARATION OF GREGORY K. SULLIVAN, P.E.**

I, Gregory K. Sullivan, P.E., being duly sworn do depose and state:

1. I make this affidavit based upon personal knowledge and expertise.

2. My professional resume is provided as **Attachment A** to this Declaration.

3. I have 37 years of experience in water resources engineering, water rights engineering, hydrologic analysis, groundwater and surface water modeling, conjunctive administration of groundwater and surface water, and other related disciplines.

4. I have worked on water resources, water rights, and conjunctive administration issues in the Snake River basin since the early 1990s.

5. My clients in the Snake River basin that are affected by the SWC Delivery Call include the City of Pocatello and the Coalition of Cities.

6. I have been a member of the Eastern Snake Plain Hydrologic Modeling Committee ("ESHMC") since its inception along with other stakeholders in Snake River basin issues. The ESHMC has provided guidance and peer review in the development of the Eastern Snake Plain Aquifer groundwater model ("ESPAM") since approximately 1999.

7. I have been involved in several water right delivery calls in the Snake River basin including the delivery calls by the Surface Water Coalition ("SWC"), the A&B Irrigation District, and the Rangen Fish Hatchery. My involvement has included preparation of expert reports and presentation of expert testimony at several administrative hearings.

8. My involvement in the SWC delivery calls began with the delivery call made in 2005. In response to that delivery call, I compiled extensive data and analyzed the operations of the SWC irrigation systems. This included several weeks in the field observing diversion and conveyance facilities, irrigated farms, and irrigation application methods. In addition, I was present at the depositions of managers and staff of each of the SWC members regarding irrigation system operations, system losses and efficiencies, record keeping, and other related matters. Based on this information, I prepared analyses of the historical irrigation operations of each SWC member over the period from 1990 – 2006. The results of my work were documented in several expert reports and presented at an IDWR hearing in February 2008.

9. Since the 2008 hearing regarding the SWC delivery call, I have reviewed the various amended methodology orders and the various as-applied orders concerning the SWC Methodology that have been issued over the years. In addition, I was involved in a May 2010 hearing on revisions to SWC Methodology proposed by IDWR based on experience in applying the methodology between 2005 and 2010, and based on recommendations from Hearing Officer Schroeder in his 2008 Order. Following the hearing, IDWR issued on June 23, 2010 the *Second Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* ("Second Methodology Order"). The Second Methodology Order contains the framework that forms the basis for the current SWC Methodology procedures.

10. In early 2015, IDWR convened a technical working group ("TWG") of experts to review proposed changes to the Second Methodology Order. I participated in the TWG on behalf of the City of Pocatello. Several meetings of the TWG were held to

solicit input from the TWG members regarding the SWC Methodology. Following the meetings, IDWR issued recommendations for changes in how the water supplies of the SWC members were forecast and how the crop mix of the SWC members was determined for purposes of estimating crop water need. Other proposed changes to the SWC Methodology were discussed but not implemented. These included determination of supplemental groundwater use by the SWC members, improvements in determination of the irrigated areas of the SWC members, and revisions to the Project Efficiencies used in determining the Reasonable In-Season Demand ("RISD") of the SWC members. IDWR's *Third Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* ("Third Methodology Order") was issued on April 16, 2015, shortly after completion of the TWG meetings.

11. On April 16, 2016, IDWR issued the *Fourth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* ("Fourth Methodology Order") that included some relatively minor revisions to the Third Methodology Order.

12. In late 2022, I actively participated in several meetings of another TWG that was convened by IDWR to consider potential changes to the Fourth Methodology Order. Given the approximate one-month period during which the TWG meetings took place, there was insufficient time to fully review and respond to the materials that IDWR distributed and the issues that were raised during the meetings. Nonetheless, I performed various preliminary analyses of the Baseline Year ("BLY") and the SWC Project Efficiencies that are used in the SWC Methodology. Results from these analyses were presented to the TWG during the meetings and written materials and spreadsheets were submitted to TWG members on December 12 and December 21.

13. On December 23, 2022, IDWR issued a one-page *Summary of Recommended Technical Revisions to the 4th Amended Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover for the Surface Water Coalition* ("IDWR Recommendation"). The following is a summary of the proposed recommendations:

    a. Update the BLY for Reasonable In-Season Demand and Reasonable Carryover from an average of diversions during 2006, 2008, 2012 to the diversions in 2018.

    b. Update the Project Efficiencies to use average of the computed efficiencies for the SWC members during the previous 15 years instead of the previous 8 years.

14. The IDWR Recommendation document explicitly stated there were no recommendations regarding the following:

    a. Use of near real-time METRIC for determining crop water need.

    b. Use of transient modeling to determine curtailment priority dates.

15. On January 16, 2023, I submitted written comments on the IDWR Recommendation including:

    a. Critique of the proposed changes to the BLY for projecting shortages to the SWC members.

    b. Critique of the updated Project Efficiencies for computing in-season demand shortages.

    c. Recommendation that the irrigated area data for the SWC members be updated to reflect the areas that are actually irrigated.

    d. Recommendation that the crop water needs for the SWC members be adjusted for the supplemental groundwater use on the SWC irrigated lands.

16. There was no acknowledgement and no response from IDWR regarding my comments. Nor was there any further interaction between IDWR and the TWG after receipt of the IDWR Recommendation on December 23, 2022.

17. On April 21, 2023, IDWR issued the *Fifth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* ("Fifth Methodology Order") and the *Final Order Regarding April 2023 Forecast Supply* ("April As-Applied Order"). There was no apparent consideration of my comments in either of these orders.

18. Also on April 21, 2023, IDWR issued a *Notice of Hearing, Notice of Prehearing Conference, and Order Authorizing Discovery*. A hearing in the matter is scheduled for June 6-10, 2023.

19. On May 2, 2023, IDWR issued a *Schedule Order and Order Authorizing Remote Appearance at Hearing*. Among the scheduled events are the following:

    a. <u>May 5, 2023</u>

        i. Deadline for the Department to identify materials Ms. Sukow and Mr. Anders may rely upon at the hearing.

        ii. Deadline for the Department to summarize topics Ms. Sukow and Mr. Anders will testify about at the hearing.

        iii. Deadline for the parties to submit to the Department a written statement of proposed issues for the hearing.

    b. <u>May 10, 2023</u>

        i. Deadline for the Department to augment its above-mentioned list of materials Ms. Sukow and Mr. Anders may rely on at the hearing, if needed.

    c. <u>7 Days Prior to Hearing Day 1</u>

        i. Deadline for the parties to complete all discovery.

ii. Deadline for the parties to deliver copies of their expert reports to the other parties.

iii. Deadline for the parties to exchange and file with the Department their proposed lay and expert witness lists. The parties should include a general summary of each witness' anticipated testimony.

20. The proposed schedule leaves less than four weeks before the due date for expert reports and only one week to review the expert reports of others before the hearing. In addition, I, along with some of the other experts, are involved in the consolidated matters of the Big Wood River and Snake River Moratoria for which expert reports are due on June 9, 2023, in the middle of the proposed SWC Methodology hearing. Finally, I have previously scheduled a non-refundable trip to Europe departing on May 17 and returning on June 3, and so, as a practical matter, this leaves less than two weeks for me to complete my expert report.

21. The short time available before my expert report is due is far too little time for me to adequately analyze the Fifth Methodology Order, the April As-Applied Order, review the supporting materials that will be submitted by the IDWR witnesses, assist legal counsel with written discovery and depositions, compile additional data, perform field work, perform the necessary technical analyses, and document my work in an expert report.

22. It has been over 15 years since the 2008 hearing and Hearing Officer Schroeder's ruling that resulted in the Second Methodology Order issued in 2010. This was the last time that the SWC Methodology was significantly scrutinized. We now have 15 years of actual operating experience under the SWC Methodology Orders. Given the substantive changes to the SWC Methodology reflected in the Fifth Methodology Order, now is an appropriate time to fully review those changes, develop a comprehensive record of the 15 years of operating experience under the prior Methodology Orders, and to use this experience to propose and vet potential additional modifications to the SWC Methodology that will protect the SWC members from injury, ensure that the SWC members are operating with efficiently and without waste, protect groundwater users from excessive curtailment and mitigation obligations, and to maximize the beneficial use of the interconnected surface water and groundwater resources of the Snake River and the ESPA.

23. Given sufficient time, I would analyze information and data from the past 15 years of operations under the SWC Methodology Orders to assess changes in the irrigation operations of the SWC members, the improved and expanded availability of hydrologic and water use data, including remote-sensed data. In addition, interviews and/or depositions of IDWR staff and SWC managers and personnel will be necessary to provide context for the past 15 years of operating experience. Thorough review and analysis of this information and data will give me the knowledge that is necessary to recommend and support potential changes to the SWC Methodology.

24. The following is a preliminary high-level overview of the work that should be performed to analyze the operation of the SWC Methodology and the operations of the SWC members during the past 15 years:

a. Compile, summarize, review, and analyze available hydrologic data and operational data related to the availability and use of water by the SWC members.

b. Interview and/or depose managers and staff of the SWC members regarding their irrigation operations, data collection practices, and water use records.

c. Perform site investigations of the SWC member facilities and service areas.

d. Assess the operations of the SWC members to determine whether they are operating with reasonable efficiencies and without excessive waste consistent with industry standards.

e. Review and analyze the elements of the SWC Methodology that involve determination of in-season demand shortfalls.

f. Review and analyze the elements of the SWC Methodology that involve determination of material injury to reasonable carryover.

g. Review and analyze the elements of the SWC Methodology that involve determination of the priority date for curtailment of junior ground water users in response to computed shortages to the in-season demands and reasonable carryover requirements of the SWC members. This includes the radical change in how the ESPAM is used to determine the curtailment date. Under the Fifth Methodology Order, IDWR is using transient runs of the ESPAM to determine the curtailment date rather than the steady-state runs that have been used in all prior methodology orders. This results in a substantially more senior curtailment date that affects many more groundwater users. The curtailment date in the April As-Applied Order is December 30, 1953, based on a projected combined shortage to the SWC members totaling 75,000 AF. Under the steady-state run procedure of the prior methodology order, the curtailment date would have been sometime in the mid-1980s for a 75,000 AF shortage.

25. I estimate that a minimum of 3 to 5 months will be necessary to adequately perform the work described above and to prepare an expert report to summarize the results of this work. In making this time estimate, I am considering the clear and convincing evidentiary standard that reportedly applies to changes in the SWC Methodology and the attendant need to fully develop the necessary evidence to support my opinions.

I hereby certify that the facts set forth above are true and correct to the best of my information and belief.

DATED this 7th day of May 2023.

Gregory K. Sullivan, P.E.

Attachment A

Gregory K. Sullivan, P.E.

President and Senior Water Resources Engineer

Education: M.S., Civil Engineering, 1990, University of Colorado - Denver
B.S., Civil Engineering, 1985, Colorado State University

Professional Registration: Professional Engineer in Colorado, Idaho, and New Mexico

Professional Experience:

1990 - Present: ***Spronk Water Engineers, Inc., President and Senior Water Resources Engineer***

Mr. Sullivan has over thirty-five years of experience completing a wide variety of water resources engineering projects. Mr. Sullivan has extensive experience performing historical consumptive use analyses, stream depletions analyses, and reservoir operations studies. Mr. Sullivan serves as the primary consultant to numerous water providers for water supply planning and water rights engineering. In that role, he has been responsible for technical analyses in supporting applications for adjudication of water rights, changes of water rights, exchanges, augmentation plans, and other water right matters. He has led the development of complex surface water operations models that simulate municipal water demands and how those demands maybe met by available water supplies and water rights. Mr. Sullivan has served on the Eastern Snake Hydrologic Modeling Committee that guides the development and use of a regional ground water model of the Eastern Snake River Plain Aquifer since 1996. Mr. Sullivan has provided expert testimony in the U.S. Supreme Court, Colorado Water Courts, Snake River Basin Adjudication Court (Idaho), and in administrative hearings before the Idaho Department of Water Resources.

Representative Projects:

Water Supply Modeling - Texas v. New Mexico and Colorado – Rio Grande Basin

Mr. Sullivan is the lead modeling expert for the State of New Mexico in an active lawsuit filed by the State of Texas in the U.S. Supreme Court concerning alleged violations of the 1938 Rio Grande Compact. Mr. Sullivan is leading a multidisciplinary team of renowned experts from across the country that is analyzing and modeling the historical operation of the Rio Grande Project and the effects of alleged compact violations asserted in the

claims and counterclaims of the parties. The ongoing work includes compilation and analysis of historical data from before the time of the compact to the present, and development of farm budget models of large irrigation systems in New Mexico, Texas, and Mexico. In addition, Mr. Sullivan is coordinating development and use of a linked surface water (RiverWare) and ground water (MODFLOW) models of the Lower Rio Grande area from Elephant Butte Reservoir in New Mexico to Fort Quitman, Texas. The Integrated Lower Rio Grande Model simulates the essential hydrologic and institutional/management processes associated with irrigation and municipal water systems in the study area, including the allocation, operation, and accounting mechanisms of the Rio Grande Project.

Water Supply Modeling - Kansas v. Colorado – Arkansas River Basin

Mr. Sullivan was involved in the refinement and use of the H-I Model of the Arkansas River system in Colorado that was developed to support claims by the State of Kansas that Colorado was violating the terms of the 1948 Arkansas River Compact. The model simulates daily operation of irrigation water uses under approximately two dozen canal systems along the Arkansas River in Colorado between the City of Pueblo and the Colorado-Kansas from 1950 to the present. In addition, the model simulates the operation of sole-source and supplemental irrigation wells, and the impact of those wells on the flow of the Arkansas River. Mr. Sullivan provided expert testimony before a Special Master appointed by the U.S. Supreme Court regarding the use of the H-I Model to evaluate the effects on state line flows resulting from post-compact well development in Colorado.

Injury Analysis - Kansas v. Colorado – Arkansas River Basin

Mr. Sullivan developed a model that was used as part of an analysis to compute the economic impacts and monetary damages to Kansas resulting from the compact violations by Colorado that were determined in the Kansas v. Colorado lawsuit. The model was used to translate monthly depletions to usable stateline flows over a 45-year period into impacts to (a) surface water users in Kansas, (b) to supplemental pumping demands in Kansas and (c) to recharge of the regional ground water system. Mr. Sullivan testified before the Special Master regarding the model development, operation, and results.

Analysis of Replacement Plans - Kansas v. Colorado – Arkansas River Basin

To continue use of post-compact Arkansas River alluvial wells, the well owners in Colorado were required to develop Replacement Plans to offset the impacts of pumping on senior surface water rights in Colorado and on usable stateline flows to Kansas. Mr. Sullivan analyzed the adequacy of these replacement plans through preparation of historical use analyses, water budgets, and other analyses. In addition, Mr. Sullivan used the H-I Model to simulate the effectiveness of the replacement plans in meeting Colorado's delivery obligations under the Arkansas River Compact. Mr. Sullivan provided expert testimony before the Special Master concerning his analyses of the Colorado Replacement Plans.

Change of Water Rights - City of Loveland, Colorado

Mr. Sullivan was the principal investigator for ditch-wide historical use analyses of the major Big Thompson River irrigation ditches that serve lands in and around the City of Loveland. These analyses served as the basis for successful changes of water rights that were approved by the Division 1 Water Court to allow the City to divert its ditch shares at the City's municipal water intakes to help meet its water supply needs. He also guided development of detailed water rights accounting for the City to Mr. Sullivan provided expert testimony in support of the changes of water rights in a contested trial.

Water Supply Yield Modeling - City of Loveland, Colorado

Mr. Sullivan led the development of a model to simulate the daily water supply and demand of the City of Loveland over a study period from 1950 - 2017. The water supplies that are simulated in the model include the ditch shares that have been changed to municipal use, Colorado-Big Thompson Project units, Windy Gap Project units, and the operation of the City's Green Ridge Glade Reservoir. The model is used by the City to evaluate the firm yield of its water supply, and how that yield can be increased through acquisition of additional supplies, development of additional storage, changes in water supply operations and other actions.

Water Supply Planning – ACWWA, Colorado

Mr. Sullivan has provided water resources and water rights consulting for the Arapahoe County Water and Wastewater Authority for over 30 years. ACWWA serves lands in the Cherry Creek basin south of Denver through a

combination of shallow alluvial wells and deep nontributary Denver Basin wells. Water use from these sources is integrated and optimized through operation of a complex plan for augmentation that provides for replacement of out-of-priority depletions to Cherry Creek to protect downstream senior water users. Mr. Sullivan has performed numerous analyses to evaluate the yield of ACWWA's water supplies, including completion of a raw water master plan in 2018.

Plan for Augmentation - Upper Cherry Creek Water Association, Colorado

Mr. Sullivan was instrumental in the development of an umbrella plan for augmentation for five major water users in the Cherry Creek Basin upstream of Cherry Creek Reservoir. The members have pooled their augmentation sources to replace the combined out-of-priority depletions resulting from alluvial well pumping and out-of-priority storage in Cherry Creek Reservoir. The plan includes an innovative method of computing depletions that considers times when Cherry Creek is dry in the vicinity of the member wells.

Cherry Creek Aquifer Modeling Project – Colorado

Mr. Sullivan led the development of a basin-wide simulation model of the hydrology and water use in the Cherry Creek basin upstream of Cherry Creek Reservoir. The model simulates the water supplies and water rights of all municipal water providers in the study area and optimizes the alluvial pumping of the water users and the use of Denver Basin ground water replacement supplies. The model also simulates the operation of Cherry Creek Reservoir and Rueter-Hess Reservoir. The model is used by the study participants to evaluate changes in water supply operations and acquisition of new water supplies.

Snake River Basin Adjudication - Idaho

Mr. Sullivan assisted the City of Pocatello in filing claims to adjudicate water rights as part of the SRBA. This work included historical research of facilities and water uses to document historical flow rates, volumes, and priority dates to assign to the claimed water rights. Mr. Sullivan provided expert testimony before the SRBA Court to help defend the City's claims that were disputed by others.

Snake River Delivery Calls - Idaho

Mr. Sullivan has provided technical analysis and expert testimony to the City of Pocatello in their participation in complex litigation involving water right delivery calls by senior surface water users on the Snake River in Idaho. Pocatello's water supply is derived primarily from junior priority wells that are tributary to the Snake River, and its water supply is threatened by the delivery calls. Mr. Sullivan analyzed the historical operation of seven major irrigation districts that placed the delivery calls to assess the extent of their claimed irrigation water shortages. The irrigation districts serve a combined area of 560,000 acres with annual diversions averaging 3.2 million acre-feet per year. Mr. Sullivan provide expert testimony is several hearings before the hearing officers in Idaho Depart of Water Resources.

ESPA Cities Mitigation Plan – Snake River Basin, Idaho

Mr. provided technical expertise and analysis in development of a mitigation plan for Pocatello, Idaho Falls, and more than a dozen other cities to mitigate the impacts of municipal groundwater pumping from the Eastern Snake Plain Aquifer in Idaho. The plan relies largely on aquifer recharge to mitigate the impacts of aquifer depletions from pumping that is projected to increase from about 60,000 acre-feet per year to over 120,000 acre-feet per year over the next 50 years.

Division 3 Rules Case - Rio Grande Basin, Colorado

Mr. Sullivan represented a group of surface water right owners that opposed the enactment of administrative rules governing the withdrawal and use of ground water in the Rio Grande Basin in Colorado (Water Division 3). The primary basis for their opposition was that the rules did not provide for mitigation of impacts to a large spring that was the source of their surface water rights and which dried up in conjunction with the large-scale development of ground water irrigation in the area. Mr. Sullivan's work included analysis of the historical irrigation water use by his clients, review of hydrologic data and records, and review of a ground water modeling of the San Luis Valley performed by the State of Colorado. Mr. Sullivan provided expert testimony on behalf of his clients in a trial before the Division 3 Water Court.

Ground Water Administrative Proceeding – Wood River Basin, Idaho

Mr. Sullivan represents the Sun Valley Company and the Cities of Ketchum, Hailey, and Bellevue in an administrative proceeding in the Wood River Valley in Idaho. Holders of senior surface water rights are seeking curtailment of junior ground water rights based on allegations of injury being suffered by the seniors, and the Idaho Department of Water Resources is proposing to implement conjunctive administration of groundwater rights and surface water rights to address the injury claims. A groundwater model of the Wood River Valley developed by IDWR with input from stakeholders is being used in the dispute to assess impacts from pumping on surface water supplies. Mr. Sullivan provided expert testimony on behalf of SVC and the Cities in a contested administrative hearing before the IDWR Director. Mr. Sullivan is also a member of a technical working group that has been assembled to develop a groundwater management plan that is hoped to settle the ongoing dispute.

1985 – 1990: ***J. W. Patterson & Associates, Inc., Water Resources Engineer***

Performed water supply, hydraulic and hydrologic analyses for agricultural, industrial, commercial, and municipal developments. Managed yield and impact analyses of water rights adjudications, transfers, exchanges and plans for augmentation. Conducted ground water studies including aquifer testing, project dewatering and water well design and construction monitoring.

Continuing Education:

Applied Ground-Water Flow Modeling. International Ground Water Modeling Center, Colorado School of Mines, Golden, CO. March 1993.

Introduction to Simulation Training in RiverWare, Center for Advanced Decision Support for Water and Environmental Systems, University of Colorado, May 2016.

IN THE MATTER OF THE DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY AND FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY

Docket No. CM-DC-2010-001

DECLARATION OF GREGORY K. SULLIVAN, P.E.

I, Gregory K. Sullivan, P.E., being duly sworn do depose and state:

1. I make this declaration based upon personal knowledge and expertise, in support of the Ground Water Users' May 5, 2023, *Motion for Reconsideration* regarding the irrigated acres of Twin Falls Canal Company ("TFCC").

2. My professional resume is provided as **Attachment A** to this Declaration.

3. In late 2022, I actively participated in several meetings of the Technical Working Group ("TWG") that was convened by the Idaho Department of Water Resources ("IDWR") to consider potential changes to the *Fourth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season*

Demand and Reasonable Carryover ("Fourth Methodology Order"). In the *Final Order Regarding April 2016 Forecast Supply (Methodology Steps 1-3)* that applied the Fourth Methodology Order, the irrigated acres for TFCC were calculated as 194,732 acres.

4. On April 21, 2023, the Director issued his *Fifth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand* ("Fifth Methodology Order") and *Reasonable Carryover* and *Final Order Regarding April 2023 Forecast Supply (Methodology Steps 1-3)* ("As-Applied Order"). The Fifth Methodology Order and As-Applied Order specify that TFCC is irrigating **194,732 acres**. *Fifth Methodology Order* at 10; *As-Applied Order* at 2.

5. During the 2008 IDWR hearing concerning the SWC Delivery Call that was filed in 2005, SPF Water Engineering, LLC ("SPF"), experts for the Idaho Ground Water Appropriators, Inc. ("IGWA"), submitted a March 20, 2007, expert report entitled *Estimate of Non-Irrigated Acres within the Twin Falls Canal Company Service Area* (Exhibit 4310). In that report, SPF found that of the total 198,632 acres that were adjudicated, 15,043 acres were not irrigated, leaving **183,589 acres** that were irrigated.

6. IDWR used **183,589 acres** as the irrigated area for TFCC for purposes of its reasonable in-season demand ("RISD") calculations in the 2013 and 2014 Methodology Orders. I have been unable to confirm the acreage figures that were used in 2010 – 2012, but I believe them to be the same 183,589 acres based on the following table pasted from the most recent RISD spreadsheet (DS RISD Calculator_2022_August 15.xlsx):

Summary of Irrigated Acres Utilized in Protocol Calculations

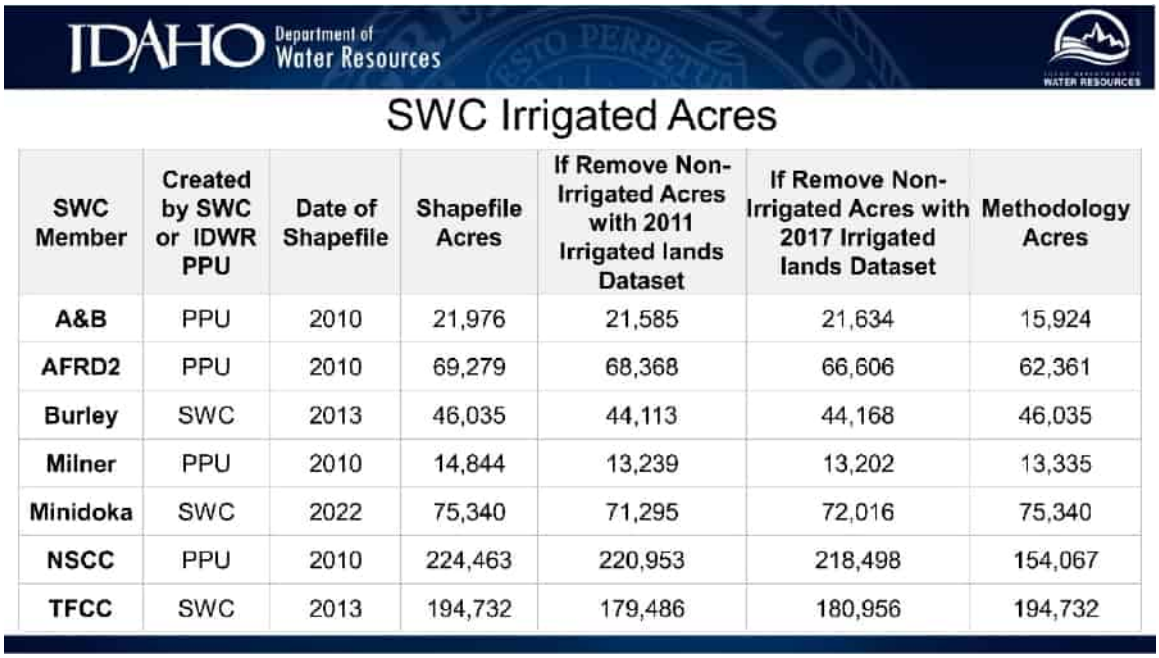
Year	Member ID	Area of Surface Water Irr (ac)	Year Acreage Established	Reference Document
2000-2014	AFRD2	62,361	5/11/2006	Director's Report
2000-2014	A&B*	15,924	5/11/2006	Director's Report
2000-2014	Milner	13,335	5/11/2006	Director's Report
2000-2014	Minidoka	70,144	12/29/2005	Exhibit 4300 Claimed POU Analysis (BID, TFCC, NSCC),Table 6 [15], SPF - 12/29/05
2000-2014	BID	44,715	12/29/2005	Exhibit 4300 Claimed POU Analysis (BID, TFCC, NSCC),Table 6 [15], SPF - 12/29/05
2000-2014	TFCC	183,589	3/20/2007	Exhibit 4310 Estimate of Non-irrigated acres w/in the TFCC Service Area, Table 10 [25], SPF - 3/20/07
2000-2014	NSCC	154,067	5/11/2006	Director's Report

7. During early 2015, IDWR convened another TWG to discuss modifications to the SWC Methodology. The irrigated area for the SWC members was among the topics discussed at these meetings. The table on the following page of acres was contained in a presentation given to the TWG on February 19, 2015, by Matt Anders of IDWR:

SWC Member	2005-2007 SPF	2012 Partial Decrees	2013 SWC Submitted Shapefiles	2013 RISD
A&B		14,637 (2006 PD = 15,924)		15,924
AFRD2		62,361		62,361
Burley	44,715	47,643	46,084	44,715
Milner		13,335		13,335
Minidoka	70,144	75,093	74,112	70,144
NSCC		154,067		154,067
TFCC	183,589	196,162	194,778	183,589

8. Travis Thompson, attorney for several of the SWC members, including TFCC, sent a letter to IDWR Director Spackman on April 8, 2015, requesting that the Director use the "authorized acres" for his client's natural flow water right for purposes of water rights administration. Mr. Thompson's letter states in part:

> With respect to the Step 1 requirement to confirm irrigated acreage for the year, our clients adopt and resubmit the letter that was delivered to you last year for purposes of 2014 administration. As noted last year, all of our clients' decreed natural flow water rights identify the number of authorized acres to irrigate within their respective project boundaries. Accordingly, the Director is required to use the elements of the partial decrees for purposes of water right administration. I.C. §§ 42-607; 1417.
>
> Moreover, all clients have confirmed that the expected irrigated area within each project this year has not varied by more than 5% from the existing information (electronic shape files) that have been submitted to you in prior years.
>
> The number of irrigated acres identified by existing shape files on file with the SRBA Court or as submitted to you in prior years is as follows: A&B - 15,924; BID -46,083; Milner-13,335; NSCC- 154,067; **TFCC - 194,778**.



Emphasis added.

9. Mr. Thompson had sent a similar letter to Director Spackman in 2014 with the same request to use a figure of 194,778 acres for the TFCC. However, IDWR continued to use the lower SPF figure of 183,589 acres in the 2014 SWC Methodology orders.

10. Beginning in 2015 and continuing through 2022, IDWR used **194,732 acres** as the irrigated area for the TFCC for purposes of the RISD calculations in the SWC Methodology Orders. This is 46 acres less than the TFCC acreage figure that was in Mr. Thompson's 2014 and 2015 letters. The reason for this slight difference is unknown.

11. In the TWG meetings that were convened by IDWR in late 2022, irrigated area was among the potential changes to the SWC Methodology that were discussed.

12. On December 1, 2023, a presentation was given by IDWR staff (Ethan Geisler, Kara Ferguson, & Matt Anders) entitled, *Proposed Modification to Method for Determining Reasonable In-Season Demand for the Surface Water Coalition: Use of the Near Real Time METRIC.* The presentation included the following slide listing the irrigated acres for the SWC members from various sources.

SWC Irrigated Acres

SWC Member	Created by SWC or IDWR PPU	Date of Shapefile	Shapefile Acres	If Remove Non-Irrigated Acres with 2011 Irrigated lands Dataset	If Remove Non-Irrigated Acres with 2017 Irrigated lands Dataset	Methodology Acres
A&B	PPU	2010	21,976	21,585	21,634	15,924
AFRD2	PPU	2010	69,279	68,368	66,606	62,361
Burley	SWC	2013	46,035	44,113	44,168	46,035
Milner	PPU	2010	14,844	13,239	13,202	13,335
Minidoka	SWC	2022	75,340	71,295	72,016	75,340
NSCC	PPU	2010	224,463	220,953	218,498	154,067
TFCC	SWC	2013	194,732	179,486	180,956	194,732

The table confirms that the **194,732 acres** used in recent SWC Methodology orders was from the 2013 SWC shapefile submitted by the SWC in 2013. Also of interest are the values determined by IDWR for the TFCC based on IDWR's 2011 and 2017 Irrigated Lands Datasets when the non-irrigated acres are removed. The resulting values are **179,486 acres** for 2011 and **180,956 acres** for 2017.

13. The irrigated acreage figures determined by IDWR for 2011 (179,486 acres) and 2017 (180,956 acres) are several thousand acres less than the value presented in the 2007 SPF report (183,589 acres) that IDWR used in the SWC Methodology Orders prior to 2015. The decline in acres is reasonable given the continued urbanization of parts of the TFCC service area.

14. In my comments submitted to the IDWR and TWG on January 16, 2023, I indicated that the irrigated acres in the shapefiles submitted by the SWC members should be verified to reasonably match the actual irrigated lands determined from aerial imaging, field verification, and/or remote sensing.

15. IGWA expert, Sophia Sigstedt, made more extensive observations about the TFCC irrigated area in her comments to IDWR and the TWG, also submitted on January 16, 2023:

> The IDWR staff presentation regarding near-real-time METRIC application identified a significant shortcoming in the current method for calculating CWN as the fact that the most up-to-date crop data is from the previous year and that SWC irrigated acre datasets sometimes represent service areas, not the actual irrigated land. Non-irrigated acres should not be considered in determining the irrigation supply necessary for SWC members. The METRIC data could first be used to create a standard review process for the Methodology Order Step 1 submittal of irrigated acres by the SWC entities. IDWR staff should use a precise determination of irrigated acreage irrespective of whether it uses METRIC in the calculation of CWN. With IDWR staff only checking against the total acres for the decreed place of use, there is little to no incentive to keep the spatial data for the irrigated acres up to date. The METRIC data would be available for the current irrigation season and can be used to assess actual irrigated land. Some of the preliminary analysis by IDWR staff using METRIC data illustrated that through processing they were able to identify about 15,000 acres within the TFCC irrigated acres dataset that should not qualify as irrigated. The mischaracterized acres were all minor areal corrections but over a large service area such as TFCC added up to a significant amount of erroneous total acres. This just highlights the importance of spending the time to get an accurate picture of irrigated acres for an accurate RISD calculation. As previously noted in Lynker's 2015 comment letter the 5% change standard for SWC submittals should be reconsidered in light of large districts like TFCC where a 5% error in the irrigated acres can result in calculation of tens of thousands of acre-feet of erroneous mitigation obligation. Liz Cresto an IDWR staff member on the TWG in 2015 also made a similar recommendation in her comment letter attached to the staff memorandum.

16. Based on the information presented by IDWR during the TWG meetings and the comments submitted by myself and Ms. Sigstedt on January 16, 2023, I expected the Director would use the irrigated acres for the TFCC that were discussed in the TWG meetings for purposes computing the RISD for the TFCC in 2023. However, the Fifth Methodology Order and the As-Applied Order continue to specify that TFCC is irrigating **194,732 acres**.

17. On May 5, 2023, the Director took official notice of the records of the TWG in his *Notice of Materials Department Witnesses May Rely upon at Hearing and Intent to Take Official Notice*.

18. The 2017 irrigated area determined by IDWR for the TFCC (180,956 acres) is **13,776 acres** less than the value proposed for 2023 (194,732 acres).

19. I computed the reduction in the annual TFCC demand that would occur if the TFCC acres were reduced by 13,776 acres using the average crop irrigation requirement for the TFCC for 2000-2021 (2.2 AF/ac) from the IDWR backup materials for the 2022 SWC Methodology and the average monthly Project Efficiency values from the Fifth Methodology Order (35%) as shown below:

TFCC Acres	
Methodology:	194,732 acres (Fifth Methodology Order at 10)
NRT Metric:	180,956 acres (12/1/2022 IDWR Presentation to TWG at 19)
Difference:	13,776 acres
TFCC Avg CIR:	2.2 AF/ac (DS RISD Calculator_2022_August 15.xslx)
TFCC Average PE:	35% (Fifth Methodology Order at 14)
Demand Reduction =	(13,776 acres x 2.2 AF/ac) / 0.35
Demand Reduction =	**86,600 AF**

20. The 86,600 AF reduction in the TFCC annual diversion demand that results from using the actual irrigated area for the TFCC in 2017 demonstrates the significance of the irrigated area input to the SWC Methodology. The **86,600 AF** reduction in annual TFCC diversion demand is less than the **75,000 AF** of shortage that is predicted for the TFCC in the April 2023 As-Applied Order.

I certify under penalty of perjury pursuant to the law of the State of Idaho that the foregoing is true and correct.

DATED this 7th day of May 2023.

Gregory K. Sullivan, P.E.

ATTACHMENT A

Attachment A

Gregory K. Sullivan, P.E.

President and Senior Water Resources Engineer

Education: M.S., Civil Engineering, 1990, University of Colorado - Denver
B.S., Civil Engineering, 1985, Colorado State University

Professional Registration: Professional Engineer in Colorado, Idaho, and New Mexico

Professional Experience:

1990 - Present: ***Spronk Water Engineers, Inc., President and Senior Water Resources Engineer***

Mr. Sullivan has over thirty-five years of experience completing a wide variety of water resources engineering projects. Mr. Sullivan has extensive experience performing historical consumptive use analyses, stream depletions analyses, and reservoir operations studies. Mr. Sullivan serves as the primary consultant to numerous water providers for water supply planning and water rights engineering. In that role, he has been responsible for technical analyses in supporting applications for adjudication of water rights, changes of water rights, exchanges, augmentation plans, and other water right matters. He has led the development of complex surface water operations models that simulate municipal water demands and how those demands maybe met by available water supplies and water rights. Mr. Sullivan has served on the Eastern Snake Hydrologic Modeling Committee that guides the development and use of a regional ground water model of the Eastern Snake River Plain Aquifer since 1996. Mr. Sullivan has provided expert testimony in the U.S. Supreme Court, Colorado Water Courts, Snake River Basin Adjudication Court (Idaho), and in administrative hearings before the Idaho Department of Water Resources.

Representative Projects:

Water Supply Modeling - Texas v. New Mexico and Colorado – Rio Grande Basin

Mr. Sullivan is the lead modeling expert for the State of New Mexico in an active lawsuit filed by the State of Texas in the U.S. Supreme Court concerning alleged violations of the 1938 Rio Grande Compact. Mr. Sullivan is leading a multidisciplinary team of renowned experts from across the country that is analyzing and modeling the historical operation of the Rio Grande Project and the effects of alleged compact violations asserted in the

claims and counterclaims of the parties. The ongoing work includes compilation and analysis of historical data from before the time of the compact to the present, and development of farm budget models of large irrigation systems in New Mexico, Texas, and Mexico. In addition, Mr. Sullivan is coordinating development and use of a linked surface water (RiverWare) and ground water (MODFLOW) models of the Lower Rio Grande area from Elephant Butte Reservoir in New Mexico to Fort Quitman, Texas. The Integrated Lower Rio Grande Model simulates the essential hydrologic and institutional/management processes associated with irrigation and municipal water systems in the study area, including the allocation, operation, and accounting mechanisms of the Rio Grande Project.

Water Supply Modeling - Kansas v. Colorado – Arkansas River Basin

Mr. Sullivan was involved in the refinement and use of the H-I Model of the Arkansas River system in Colorado that was developed to support claims by the State of Kansas that Colorado was violating the terms of the 1948 Arkansas River Compact. The model simulates daily operation of irrigation water uses under approximately two dozen canal systems along the Arkansas River in Colorado between the City of Pueblo and the Colorado-Kansas from 1950 to the present. In addition, the model simulates the operation of sole-source and supplemental irrigation wells, and the impact of those wells on the flow of the Arkansas River. Mr. Sullivan provided expert testimony before a Special Master appointed by the U.S. Supreme Court regarding the use of the H-I Model to evaluate the effects on state line flows resulting from post-compact well development in Colorado.

Injury Analysis - Kansas v. Colorado – Arkansas River Basin

Mr. Sullivan developed a model that was used as part of an analysis to compute the economic impacts and monetary damages to Kansas resulting from the compact violations by Colorado that were determined in the Kansas v. Colorado lawsuit. The model was used to translate monthly depletions to usable stateline flows over a 45-year period into impacts to (a) surface water users in Kansas, (b) to supplemental pumping demands in Kansas and (c) to recharge of the regional ground water system. Mr. Sullivan testified before the Special Master regarding the model development, operation, and results.

Analysis of Replacement Plans - Kansas v. Colorado – Arkansas River Basin

To continue use of post-compact Arkansas River alluvial wells, the well owners in Colorado were required to develop Replacement Plans to offset the impacts of pumping on senior surface water rights in Colorado and on usable stateline flows to Kansas. Mr. Sullivan analyzed the adequacy of these replacement plans through preparation of historical use analyses, water budgets, and other analyses. In addition, Mr. Sullivan used the H-I Model to simulate the effectiveness of the replacement plans in meeting Colorado's delivery obligations under the Arkansas River Compact. Mr. Sullivan provided expert testimony before the Special Master concerning his analyses of the Colorado Replacement Plans.

Change of Water Rights - City of Loveland, Colorado

Mr. Sullivan was the principal investigator for ditch-wide historical use analyses of the major Big Thompson River irrigation ditches that serve lands in and around the City of Loveland. These analyses served as the basis for successful changes of water rights that were approved by the Division 1 Water Court to allow the City to divert its ditch shares at the City's municipal water intakes to help meet its water supply needs. He also guided development of detailed water rights accounting for the City to Mr. Sullivan provided expert testimony in support of the changes of water rights in a contested trial.

Water Supply Yield Modeling - City of Loveland, Colorado

Mr. Sullivan led the development of a model to simulate the daily water supply and demand of the City of Loveland over a study period from 1950 - 2017. The water supplies that are simulated in the model include the ditch shares that have been changed to municipal use, Colorado-Big Thompson Project units, Windy Gap Project units, and the operation of the City's Green Ridge Glade Reservoir. The model is used by the City to evaluate the firm yield of its water supply, and how that yield can be increased through acquisition of additional supplies, development of additional storage, changes in water supply operations and other actions.

Water Supply Planning – ACWWA, Colorado

Mr. Sullivan has provided water resources and water rights consulting for the Arapahoe County Water and Wastewater Authority for over 30 years. ACWWA serves lands in the Cherry Creek basin south of Denver through a

combination of shallow alluvial wells and deep nontributary Denver Basin wells. Water use from these sources is integrated and optimized through operation of a complex plan for augmentation that provides for replacement of out-of-priority depletions to Cherry Creek to protect downstream senior water users. Mr. Sullivan has performed numerous analyses to evaluate the yield of ACWWA's water supplies, including completion of a raw water master plan in 2018.

Plan for Augmentation - Upper Cherry Creek Water Association, Colorado

Mr. Sullivan was instrumental in the development of an umbrella plan for augmentation for five major water users in the Cherry Creek Basin upstream of Cherry Creek Reservoir. The members have pooled their augmentation sources to replace the combined out-of-priority depletions resulting from alluvial well pumping and out-of-priority storage in Cherry Creek Reservoir. The plan includes an innovative method of computing depletions that considers times when Cherry Creek is dry in the vicinity of the member wells.

Cherry Creek Aquifer Modeling Project – Colorado

Mr. Sullivan led the development of a basin-wide simulation model of the hydrology and water use in the Cherry Creek basin upstream of Cherry Creek Reservoir. The model simulates the water supplies and water rights of all municipal water providers in the study area and optimizes the alluvial pumping of the water users and the use of Denver Basin ground water replacement supplies. The model also simulates the operation of Cherry Creek Reservoir and Rueter-Hess Reservoir. The model is used by the study participants to evaluate changes in water supply operations and acquisition of new water supplies.

Snake River Basin Adjudication - Idaho

Mr. Sullivan assisted the City of Pocatello in filing claims to adjudicate water rights as part of the SRBA. This work included historical research of facilities and water uses to document historical flow rates, volumes, and priority dates to assign to the claimed water rights. Mr. Sullivan provided expert testimony before the SRBA Court to help defend the City's claims that were disputed by others.

Snake River Delivery Calls - Idaho

Mr. Sullivan has provided technical analysis and expert testimony to the City of Pocatello in their participation in complex litigation involving water right delivery calls by senior surface water users on the Snake River in Idaho. Pocatello's water supply is derived primarily from junior priority wells that are tributary to the Snake River, and its water supply is threatened by the delivery calls. Mr. Sullivan analyzed the historical operation of seven major irrigation districts that placed the delivery calls to assess the extent of their claimed irrigation water shortages. The irrigation districts serve a combined area of 560,000 acres with annual diversions averaging 3.2 million acre-feet per year. Mr. Sullivan provide expert testimony is several hearings before the hearing officers in Idaho Depart of Water Resources.

ESPA Cities Mitigation Plan – Snake River Basin, Idaho

Mr. provided technical expertise and analysis in development of a mitigation plan for Pocatello, Idaho Falls, and more than a dozen other cities to mitigate the impacts of municipal groundwater pumping from the Eastern Snake Plain Aquifer in Idaho. The plan relies largely on aquifer recharge to mitigate the impacts of aquifer depletions from pumping that is projected to increase from about 60,000 acre-feet per year to over 120,000 acre-feet per year over the next 50 years.

Division 3 Rules Case - Rio Grande Basin, Colorado

Mr. Sullivan represented a group of surface water right owners that opposed the enactment of administrative rules governing the withdrawal and use of ground water in the Rio Grande Basin in Colorado (Water Division 3). The primary basis for their opposition was that the rules did not provide for mitigation of impacts to a large spring that was the source of their surface water rights and which dried up in conjunction with the large-scale development of ground water irrigation in the area. Mr. Sullivan's work included analysis of the historical irrigation water use by his clients, review of hydrologic data and records, and review of a ground water modeling of the San Luis Valley performed by the State of Colorado. Mr. Sullivan provided expert testimony on behalf of his clients in a trial before the Division 3 Water Court.

Ground Water Administrative Proceeding – Wood River Basin, Idaho

Mr. Sullivan represents the Sun Valley Company and the Cities of Ketchum, Hailey, and Bellevue in an administrative proceeding in the Wood River Valley in Idaho. Holders of senior surface water rights are seeking curtailment of junior ground water rights based on allegations of injury being suffered by the seniors, and the Idaho Department of Water Resources is proposing to implement conjunctive administration of groundwater rights and surface water rights to address the injury claims. A groundwater model of the Wood River Valley developed by IDWR with input from stakeholders is being used in the dispute to assess impacts from pumping on surface water supplies. Mr. Sullivan provided expert testimony on behalf of SVC and the Cities in a contested administrative hearing before the IDWR Director. Mr. Sullivan is also a member of a technical working group that has been assembled to develop a groundwater management plan that is hoped to settle the ongoing dispute.

1985 – 1990: ***J. W. Patterson & Associates, Inc., Water Resources Engineer***

Performed water supply, hydraulic and hydrologic analyses for agricultural, industrial, commercial, and municipal developments. Managed yield and impact analyses of water rights adjudications, transfers, exchanges and plans for augmentation. Conducted ground water studies including aquifer testing, project dewatering and water well design and construction monitoring.

Continuing Education:

Applied Ground-Water Flow Modeling. International Ground Water Modeling Center, Colorado School of Mines, Golden, CO. March 1993.

Introduction to Simulation Training in RiverWare, Center for Advanced Decision Support for Water and Environmental Systems, University of Colorado, May 2016.

Attorneys for American Falls Reservoir District #2 and Minidoka Irrigation District

BEFORE THE DEPARTMENT OF WATER RESOUCES

OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **SURFACE WATER COALITION'S OPPOSITION TO GROUNDWATER USERS' MOTION FOR RECONSIDERATION OF ORDER DENYING MOTION FOR CONTINUANCE**

COME NOW, A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, and TWIN FALLS CANAL COMPANY ("Surface Water Coalition," "Coalition," or "SWC"), by and through counsel of record, and pursuant to the Department's Rules of Procedure (IDAPA 37.01.01.220) hereby file the following response in opposition to the *Motion for Reconsideration*

of Denial of Continuance ("*Motion*") filed jointly by the Coalition of Cities, Cities of Idaho Falls and Pocatello, the Idaho Ground Water Appropriators, Inc. ("IGWA"), Bonneville-Jefferson Ground Water District, and Bingham Ground Water District (hereinafter collectively referred to as "Groundwater Users") on May 5, 2023. For the reasons set forth below, as well as those stated on the record at the April 28, 2023 pre-hearing conference, the Director should deny the motion for reconsideration.

STANDARD OF REVIEW

The Director denied the Groundwater Users' motion for a continuance. *See Order Denying the Appointment of an Independent Hearing Officer and Motion for Continuance and Limiting Scope of Depositions* (May 5, 2023) ("*May 5 Order*"). The Groundwater Users now ask the Director to reconsider that decision pursuant to Department Rule of Procedure 711 (IDAPA 37.01.01.711). *See Motion* at 2-3. The Director's review of the motion is governed by the same standard of review of the underlying motion. *See e.g. Fragnella v. Petrovich*, 153 Idaho 266, 276, 281 P.3d 103, 113 (2012).

The Department's rules authorize a presiding officer to "continue proceedings for further hearing." Rule 560. Although not stated, the decision to grant a motion for a continuance is presumably vested in the presiding officer's discretion. Idaho case law provides that the "decision to grant a motion for a continuance rests within the sound discretion of the trial court." *See State v. Labbee*, 2023 WL 1131212 at *2 (Idaho Ct. App., Jan. 31, 2023). The Coalition submits that the Director properly exercised his discretion in denying the Groundwater Users' motion given the unique circumstances of water right administration and the requirement to protect senior water rights during the irrigation season. The Director identified these reasons both at the pre-hearing conference and in his *May 5 Order*.

The Coalition offers the following points in support of the Director's decision and in opposition to the Groundwater Users' present request for reconsideration.

I. IGWA Has No Authority and Has Not Proposed to Mitigate for Non-Member Junior Ground Water Right Holders.

A fatal flaw in the Groundwater Users' request for a continuance is their erroneous claim that "IGWA has enough the [sic] water to mitigate for its 2021 breach and for the predicted demand shortfall for the upcoming 2023 season." *See* Motion at 6. The Groundwater Users also wrongly allege that the "other remaining junior users account a fractional percentage of the groundwater depletions which are allegedly causing injury" and "the Director should consider the junior water users 'as a whole' are complying with mitigation plans." *Id.* at 7.

IGWA's representative districts do not represent and have no authority to mitigate for any junior groundwater right holders who are not members of a groundwater district. *See* I.C. § 42-5224(6). This is also confirmed in IGWA's *Notice of Ground Water District Mitigation* ("*Notice*") wherein the districts represent they are only proposing to mitigate for their members.[1] *See Notice* at 2-3 ("These districts' proportionate shares of the 63,645 acre-feet demand shortfall predicted in the April 2023 As-Applied Order are as follows . . ."). Stated another way, the *Notice* does not indicate that the districts will mitigate for the entire predicted demand shortfall of 75,200 acre-feet.

[1] IGWA provided notice of mitigation for Bingham, Bonneville-Jefferson, and Jefferson Clark Ground Water Districts pursuant to its "storage water" mitigation plan (CM-MP-2009-007) and for Aberdeen-American Falls, Carey Valley, Henry's Fork/Madison, Magic Valley and North Snake Ground Water Districts pursuant to the 2016 stipulated mitigation plan (CM-MP-2016-001). The Districts mistakenly believe they pick and choose which mitigation plans to follow. The Coalition reserves all rights with respect to IGWA's *Notice* and any notion that the Districts are free to "mix and match" compliance with prior plans and orders. Further, contrary to the Groundwater Users' claim, nothing in the 2023 *Notice* applies to the parties' prior settlement concerning certain Districts' 2021 breach of their mitigation plan. *See* 2021 Settlement at 2 (Sept. 7, 2022) ("Such amounts will be in addition to the long-term obligations set forth in section 3 of the Settlement Agreement and approved mitigation plan") (emphasis added).

Nowhere in the *Notice* does IGWA claim to represent or mitigate for junior ground water rights represented in the difference between their proportionate share (63,645 af) and the predicted in-season demand shortfall (75,200 af), which is approximately 11,555 acre-feet (i.e. 15%).[2] The Groundwater Users' attempts to minimize this quantity or have it swept into considering junior users "as a whole" across the ESPA is contrary to law and the facts and should be rejected.

Whereas the Director has indicated he does not plan to issue a curtailment order until after the hearing in this matter, each day that passes is critical for purposes of water right administration during the 2023 irrigation season. Thus, any delay in the schedule would inevitably delay administration of any affected junior ground water rights not covered through an approved mitigation plan. Every day that passes furthers the potential that unmitigated pumping will continue to injure senior surface water rights without adequate mitigation as the irrigation season has already commenced throughout the various administrative basins across Eastern Snake Plain Aquifer ("ESPA").

Further exacerbating potential injury this year is a pending sentinel well index measurement for April 2023 that may be approaching the April 2015 level. The attached groundwater level data from one USGS monitoring well going back to early 1950s (2N35E35DCC1) shows a record low reading this spring. *See* **Ex. A**. The declining groundwater levels are likely reducing hydraulically connected reach gains in the Near Blackfoot to Minidoka reach of the Snake River this year, further reducing available water to the Coalition members. Contrary to the Groundwater Users' theory, just looking at the current snowpack does not tell the whole story on injury to the Coalition, the health and status of the ESPA, or trends in reach gains in the Snake River. *See Motion for Continuance* at 3, (Apr. 28, 2023).

[2] This number includes the proportionate share assigned to A&B (458 acre-feet).

II. The Requested Continuance Does Not Account for Non-Compliant Ground Water Districts and Continuing Injury from Out-of-Priority Diversions.

The Steering Committee for the SWC and IGWA held a meeting on April 12, 2023 concerning the Ground Water Districts' 2022 performance and their April 1st report. A joint letter was signed and submitted by counsel for IGWA and SWC to the Director stating that SWC asserts that in 2022 certain Districts breached the 2016 stipulated migration plan and order based upon information provided by IGWA. *See Travis L. Thompson April 13, 2023 Letter to Director Gary Spackman*. The Districts disagree that a breach occurred in 2022 and their counsel has indicated they intend to appeal the Director's *Amended Final Order Regarding Compliance with Approved Mitigation Plan* (April 24, 2023) to district court.

At the April 28th pre-hearing conference the Director appeared to indicate that he would not address the alleged 2022 breach until after a hearing was held on the Fifth Methodology Order. Based upon IGWA's recent *Notice of Ground Water District Mitigation*, several Districts indicated they intend to mitigate pursuant to the 2016 Stipulated Plan and Order, while Bingham, Bonneville-Jefferson, and Jefferson-Clark Ground Water Districts apparently propose to mitigate pursuant to a prior "storage only" mitigation plan.[3] *See Notice* at 2-3. Despite receiving "safe harbor" from 2015-2022 and not securing sufficient storage to mitigate predicted in-season injuries in certain years pursuant to the Director's order, these districts now believe they are free to "pick and choose" which plan to follow. Through this filing it is apparent that these three Districts that are parties to the 2015 Settlement Agreement and 2016 Stipulated Mitigation Plan no longer believe they are bound by the Director's orders approving that plan and subsequent addendums.

[3] The Coalition reserves the right to pursue all administrative and judicial remedies with respect to the Districts' breach of the 2015 Settlement Agreement, the 2016 Stipulated Mitigation Plan and final order approving the same.

Further, it is now known that Bingham, Bonneville-Jefferson, and Jefferson-Clark Ground Water Districts have each breached the 2016 Stipulated Mitigation Plan and Order again in 2022.[4] These Districts' continued non-compliance in 2022 will have impacts on the Coalition's water supply in 2023. To date, these districts have failed to present any viable proposals to cure the non-compliance despite receiving safe harbor from administration in 2022. The Director's 2016 Order approving the Stipulated Mitigation Plan requires the Ground Water Districts to take actions to restore groundwater levels on the ESPA and it is now obvious that the three named districts will not comply with that order again in 2023. *See Notice* at 2 ("The Districts identified in the following table will provide mitigation to the SWC under the Storage Water Plan").[5]

A delay in the hearing will presumably result in a delay of any required actions by the Districts that breached the 2016 Order in 2022 (according to the Director's indication at the April 28th pre-hearing conference), thus further depleting aquifer levels and the source of SWC's natural flow supplies. All the while, the three named Districts will no doubt claim "safe harbor" from administration and will pump their out-of-priority ground water rights unrestricted without taking actions to replenish the aquifer as they previously promised.

[4] Counsel for IGWA has represented they intend to appeal the Director's recent *Amended Final Order Regarding Compliance with Approved Mitigation Plan* (April 24, 2023). Given this position and the parties' impasse at the April 12, 2023 Steering Committee meeting as documented in the April 13, 2023 letter, the Director should address the Districts' failure to undertake the required conservation obligations in 2022 pursuant to the Second Addendum process and his order approving the same. *See Second Addendum* at 3, section 2.c.iv; *Final Order Approving Amendmetn to Stipulated Mitigation Plan* (May 9, 2017). The fact Bingham, Bonneville-Jefferson, and Jefferson-Clark Ground Water Districts are representing they will not comply with that mitigation plan at the outset of 2023 is further reason for the Director to address this matter as soon as possible.

[5] The Districts continued non-performance under the 2016 Stipulated Mitigation Plan exacerbates declining reach gains which were specifically acknowledged in that agreement. To the contrary, the Storage Water Plan does not address the long-term obligations the Districts committed to in 2015.

The blatant repeated failure by Bingham, Bonneville-Jefferson, and Jefferson-Clark Ground Water Districts to comply with the Director's orders approving the 2016 Stipulated Plan is yet another reason to deny the Groundwater Users' motion to reconsider the denial of their motion for continuance of the hearing in this matter.

III. IDWR Has Held Conjunctive Administration Hearings Under Similar Schedules / Virtual Participation Accommodation.

The bulk of the Groundwater Users' reason for asking for a continuance is the current schedules of certain consultants and counsel. *See Motion* at 3-5. Certainly participating in an administrative with numerous parties, counsel, and expert witnesses can be challenging. On April 21, 2023, cognizant of these challenges and proactively addressing likely petitions for hearing, the Director set a hearing for June 6-10, 2023. While individual schedules may need to be adjusted in order for a particular person to participate in this matter, all parties are subject to the same schedule and deadlines set by the Director, which gave the parties over six weeks to prepare for the hearing.[6] The Groundwater Users fail to recognize that the Surface Water Coalition and its consultants are all required to work within the same timeframe and will have to address their individual schedules as well.

Further, IDWR has previously scheduled and held hearings within similar timeframes, including in this very case. Accordingly, the Groundwater Users should not be surprised as to this type of scheduling in conjunctive administration matters occurring at the outset of an irrigation season.

[6] The Coalition opposes the Groundwater Users' theory that this hearing could be moved and replace an already scheduled hearing in another contested case. *See Motion* at 8. The consolidated Big Wood River / Snake River Moratorium matter involves a host of other parties, counsel, consultants, and IDWR staff that are not involved in this case. Given the difficulty in scheduling in that matter with the number of counsel involved, the Director had to delay a proposed hearing timeframe from August to October. Further, the moratorium case hearing was set over a month ago and the parties are subject to pending deadlines in that case. *See Notice of Hearing* (March 31, 2023). The Groundwater Users do not speak for the others involved in that matter and have no basis to suggest changing that schedule in the context of a wholly separate case.

In 2010 the Director issued the first methodology order on April 7th and held a hearing on both the methodology and the first April As Applied order (dated April 29, 2010) on May 24-26, 2010 (i.e. roughly a similar six-week schedule). On appeal Judge Wildman found that the process employed by IDWR did not violate IGWA's or the City of Pocatello's rights to due process. *See Memorandum Decision* at 35-36, 47 (Gooding County Dist. Ct., Fifth Jud. Dist. CV-2010-382 et al., Sept. 26, 2014). Clearly, water right administration, and any necessary administrative procedures must occur in a timely fashion in order to be effective. The Groundwater Users' requested continuance is the type of situation Judge Wood warned against that would inevitably harm senior rights. *See Order on Plaintiffs' Motion for Summary Judgment* at 97 (*AFRD#2 et al. v. IDWR*, Gooding County Dist. Ct., Fifth Jud. Dist., Case No. CV-2006-600, June 2, 2006) ("In practice, an untimely decision effectively becomes the decision; i.e. 'no decision is the decision.'")

In addition to the prior May hearings held in this case back in 2010, the Director recently initiated an administrative proceeding in Basin 37 in early May 2021 and then held an hearing in early June that year. Requests for continuance and injunctive relief were denied in that case, and the parties accommodated the schedule and presented evidence and exhibits during a five-day hearing held between June 8-12, 2021.

Although travel and participation by out-of-state consultants may pose further challenges in this case,[7] the Coalition would propose that consultants who cannot travel to Boise between June 6 and 10, be allowed to present testimony virtually (i.e. Zoom, Webex, etc.).[8] As virtual

[7] The City of Pocatello's consultant, Greg Sullivan, has a scheduled trip to Europe but will be back before the hearing and does not claim he cannot attend in person. *See Dec. of Greg Sullivan* at 5, ¶ 20.

[8] The Director has already approved allowing Candice McHugh to participate remotely to accommodate her travel to a college football event. *See Scheduling Order* (May 2, 2023); *see Dec. of Candice McHugh* at 2; *see also*, *May 5 Order* at 2, n. 1. In light of that accommodation, certainly IGWA's consultant Ms. Sigstedt should be allowed to

hearings have been routinely used in prior administrative and court proceedings around the State of Idaho (particularly during the COVID-19 epidemic), the Department has the technology and capability of handling such requests. A virtual participation accommodation will address the concerns raised by IGWA and the Cities regarding their consultants that may be located out-of-state during that time, or unable to travel to Boise for medical reasons.

The Coalition would agree to work with the parties and their consultants to accommodate such participation during the hearing timeframe and would request the same consideration if needed.

III. Bonneville-Jefferson Ground Water District's Decision to Hire New Counsel and Consultants at this Stage Does Not Justify a Continuance.

Finally, Bonneville-Jefferson Ground Water District makes a specific plea for continuance on the basis that the District recently hired new counsel and consultants. *See Motion* at 5-6. Although the District was previously represented by the law firm of Racine Olson and retained consultants Sophia Sigstedt and Jaxon Higgs, including through the technical working group process last fall and winter, the District has apparently substituted counsel and retained new consultants (Bryce Contor and Thane Kindred, Rocky Mountain Environmental Associates).[9]

While the District has the right to make such changes, those recent changes do not justify continuing a hearing that would inevitably delay conjunctive administration for the benefit of

---

participate virtually given her medical restriction that requires her to stay in Colorado until mid-July. *See Dec. of Sophia Sigstedt* at 5. The Coalition would stipulate to Ms. Sigstedt's virtual participation.

[9] Mr. Johns has attended meetings for Bonneville-Jefferson in the past, including the summer of 2022, and recently participated in the hearing on the Director's September 8, 2022 Order held on February 8, 2023. Given that background certainly Mr. Johns has some familiarity with the SWC delivery call and prior orders regarding conjunctive administration. It is not known when Bonneville-Jefferson retained its new consultants.

their members.[10] Moreover, the timing of Bonneville's change is at their own risk given the Director's intention to make adjustments to the methodology order that have been known for months, including by their prior consultants that participated in the technical working group. Such a request for delay is particularly troublesome given Bonneville-Jefferson's repeated failures to comply with its mitigation plan in 2021 and 2022, and its notice that it will not comply with the 2016 Stipulated Plan in 2023. *See Notice* at 2. Moreover, the Director's methodology in this case has been in the public record at IDWR for well over a decade. It is presumed that Bonneville-Jefferson has been fully apprised of the various methodology orders issued between 2010-2016 through its prior counsel and consultants.[11]

In sum, there is no prejudice to Bonneville-Jefferson where it has been aptly represented on these issues by prior counsel and consultants for years, including through the technical working group initiated by IDWR last fall. Changing counsel and consultants is not a valid reason for the Director to reconsider the denial of the motion for continuance.

CONCLUSION

In conclusion the Coalition submits the Director properly exercised his discretion in denying the Groundwater Users' motion for continuance. Time is of the essence for conjunctive administration this irrigation season, and given present aquifer levels and likely decreased reach gains this summer, any delay in the process stands to harm the Coalition's senior surface water rights. The Coalition therefore submits the Groundwater Users' motion for reconsideration should be denied.

---

[10] None of the declarations of Bonneville-Jefferson's new counsel or consultants indicate they would not be available to participate at the June 6-10, 2023.

[11] The Technical Working Group presentations and comments were all provided to Bonneville-Jefferson's prior consultants (Ms. Sigstedt and Mr. Higgs) and counsel (Mr. Budge). Further, while the Coalition has similarly retained additional consultants that did not participate in the workgroup, they will likewise be subject to the same timeframe and deadlines to respond and participate in this case.

DEPARTMENT OF WATER RESOURCES

IN THE MATTER OF THE DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY AND FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **I.R.C.P. 30(b)(6) NOTICE OF TAKING DEPOSITION DUCES TECUM OF IDWR**

To: Idaho Department of Water Resources and ITS counsel of record

PLEASE TAKE NOTICE that counsel for Idaho Ground Water Appropriators, Inc., Bingham Ground Water District, Bonneville-Jefferson Ground Water District, and the Cities of Idaho Falls, Pocatello, Jerome, Burley, Bliss, Carey, Declo, Dietrich, Gooding, Hazelton, Heyburn, Paul, Richfield, Rupert, Shoshone, and Wendell will take the deposition of Idaho Department of Water Resources ("Department") before M&M Court Reporting ("M&M") in accordance with the *Order Authorizing Discovery* issued April 21, 2023, IDAPA 37.01.01.520.01.a and 37.01.01.520.02, and Idaho Rules of Civil Procedure 26, 30(a), 34 and 30(b)(6). The deposition will commence on a trailing docket immediately following the deposition of Matthew Anders scheduled to begin at

9:00 a.m. on **May 12, 2023**, and continuing from day to day thereafter until completion, at the office of the **Idaho Department of Water Resources, 322 E. Front Street, Boise, Idaho 83702**. The deponent must be present in person. The court reporter will participate in person. Attorney may participate in person or via the Zoom video platform, hosted by M&M. Participants will receive a Zoom link via email from M&M the day before the deposition.

The Department is required to designate one or more persons to testify on its behalf, and may set forth, for each person designated, the matters on which the person will testify, regarding any information considered by Department staff and/or the Director in developing the *Fifth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* issued April 21, 2023 ("Fifth Methodology Order") and/or the *Final Order Regarding April 2023 Forecast Supply (Methodology Steps 1-3)* ("As-Applied Order") issued April 21, 2023, that is not included among the materials that Ms. Sukow and Mr. Anders may rely upon and the topics they may testify about pursuant to the *Notice of Materials Department Witnesses May Rely Upon at Hearing And Intent to Take Official Notice* issued May 5, 2023, including but not limited to the following:

1. The futile call doctrine pursuant to rules 10.08 and 20.04 of the Rules for Conjunctive Management of Surface and Ground Water Resources ("CM Rules").

2. The policy of full economic development of underground water resources pursuant to CM Rules 10.07 and 20.03.

3. The policy that an appropriator is not entitled to command the entirety of large volumes of water in a surface or ground water source to support his appropriation contrary to the public policy of reasonable use of water pursuant to CM Rule 20.03.

4. The reasonableness of the diversion and use of water by the Surface Water Coalition pursuant to CM Rules 20.03, 20.05, 40.03, and 42.

5. The extent to which the water needs of the Surface Water Coalition could be met with their existing facilities and water supplies by employing reasonable diversion and conveyance efficiency and conservation practices pursuant to CM Rule 42.

6. The change from a steady-state to a transient-state application of the ESPA Model in the Fifth Methodology Order.

7. The Department's review of comments submitted by outside consultants in response to the *Summary of Recommended Technical Revisions to the 4th Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover for the Surface Water Coalition* issued by Department staff dated December 23, 2023.

8. Any alleged non-compliance by groundwater users the so-called IGWA-Surface Water Coalition Settlement Agreement approved as a mitigation plan in IDWR Docket No. CM-MP-2016-001.

9. The documents identified below.

The deponent is required to bring with him or her true and correct copies of all documents reviewed by Department staff and/or the Director in connection with development of the Fifth Methodology Order or the As-Applied Order that relate, directly or indirectly, to the topics identified above, including but not limited to the following:

1. Documents relating to the implementation of a trim line or any other mechanism that could be used to implement the futile call doctrine, the policy of full economic development of underground water resources, and/or the policy that an appropriator is not entitled to command the entirety of large volumes of water in a surface or ground water source to support his appropriation contrary to the public policy of reasonable use of water.
2. Letters, emails, text messages and other correspondence sent by Department personnel to any person not employed by the Department, or received by Department personnel from any person not employed by the Department, concerning the Fifth Methodology Order and/or the April 2023 As-Applied Order, or the development of such orders, prior to 6:45 p.m. mountain daylight time, April 21, 2023.
3. Documents showing the actual or estimated total number of water rights that would be curtailed under the April 2023 As-Applied Order in the absence of approved mitigation plans; the total number of water rights by beneficial use (irrigation, municipal, industrial, commercial, etc.) that would be curtailed; and/or the total number of acres authorized for irrigation that would be curtailed.
4. Documents showing the actual or estimated total number of water rights that would be curtailed under the April 2023 As-Applied Order in the absence of approved mitigation plans.
5. Documents showing the number of water rights by beneficial use (irrigation, municipal, commercial, etc.) that would be curtailed under the April 2023 As-Applied Order in the absence of approved mitigation plans.
6. Documents showing the actual or estimated total number of acres authorized for irrigation that would be curtailed under the April 2023 As-Applied Order in the absence of approved mitigation plans.
7. Documents showing the actual or estimated total diversion rate (cubic feet per second) authorized for diversion under water rights that would be curtailed under the April 2023 As-Applied Order in the absence of approved mitigation plans.
8. Documents showing the actual or estimated total volume of water (acre-feet) authorized for diversion under water rights that would be curtailed under the April 2023 As-Applied Order in the absence of approved mitigation plans.

9. Documents relating to the extent, degree, or magnitude of beneficial use of water that would be curtailed under the April 2023 As-Applied Order in the absence of approved mitigation plans.
10. Documents relating to projected, estimated, or potential crop loss or any other impairment of beneficial use of water within Twin Falls Canal Company as a result of the 75,200 acre-feet Demand Shortfall predicted by the April 2023 As-Applied Order.
11. Documents comparing the adverse effects of curtailment under the Fifth Methodology Order and/or April 2023 As-Applied Order, in the absence of approved mitigation plan, on beneficial use of the ESPA versus the corresponding benefit to Twin Falls Canal Company.
12. Documents relating to the effect of the Fifth Methodology Order and/or the April 2023 As-Applied Order on ground water districts and/or their patrons who are not compliance with the so-called IGWA-Surface Water Coalition Settlement Agreement approved as a mitigation plan in IDWR Docket No. CM-MP-2016-001.

For purposes of this notice, the term "document" is to be interpreted as broadly as Idaho Rule of Civil Procedure 34 allows and includes all written or graphic matter, whether physical or electronic, however produced, including, but not limited to, letters, emails, text messages, notes, memoranda, meeting minutes, reports, directives, proposals, summaries, analyses, spreadsheets, internal communications, external communications, studies, surveys, working papers, and other physical or electronic data of any kind.

All parties and their counsel are invited to attend. The oral examination will continue from day to day until completed.

STATE OF IDAHO

DEPARTMENT OF WATER RESOURCES

IN THE MATTER OF THE DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY AND FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **Groundwater Users' First Set of Request for Production to IDWR; Or, Alternatively, Request for Public Records**

To: Idaho Department of Water Resources

Idaho Ground Water Appropriators, Inc., Bingham Ground Water District, Bonneville-Jefferson Ground Water District, and the Cities of Idaho Falls, Pocatello, Jerome, Burley, Bliss, Carey, Declo, Dietrich, Gooding, Hazelton, Heyburn, Paul, Richfield, Rupert, Shoshone, and Wendell; and Bingham Ground Water District and Bonneville-Jefferson Ground Water District (collectively, the "Groundwater Users"), hereby require you to produce the following documents pursuant to rules 520 and 521 of the Rules of Procedure of the Idaho Department of Water Resources (IDWR), Rules 26 and 34 of the Idaho Rules of Civil Procedure, and the *Order Authorizing Discovery* issued April 21, 2023, in this matter.

If the Department determines that the information requested below is not discoverable, the Department is requested to produce such documents pursuant to the Public Records Act, Chapter 1, Title 74, Idaho Code. If documents are produced under the Public Records Act, the Groundwater Users will promptly pay statutorily authorized fees upon request.

Given the compressed nature of the hearing schedule in this matter, the Groundwater Users respectfully request that such documents be produced as expeditiously as possible.

INSTRUCTIONS

1. When answering these discovery requests, you are required to furnish all information and documents known or available upon reasonable inquiry to you.

2. These discovery requests are deemed continuing, and your answers are to be supplemented as additional information become available or known to you.

3. If any requested document was at one time in existence but is no longer in existence, please state: (a) the date it ceased to exist; (b) the circumstances under which it ceased to exist; (c) the identity of all persons having knowledge of the circumstances under which it ceased to exist; and (d) the identity of all persons having knowledge of its contents.

4. If any requested information is withheld due to a claim of privilege, please state: (a) the request to which it is responsive; (b) its title and general subject matter; (c) its date; (d) the names and titles of its authors or preparers; (e) the names and titles of the persons for whom it was prepared and all persons to whom it was sent or shown; (f) the privilege claimed; and (g) sufficient description to enable IGWA to assess the applicability of the privilege as required by I.R.C.P. 26(b)(5)(A).

DEFINITIONS

1. April 2023 As-Applied Order means the *Final Order Regarding April 2023 Forecast Supply (Methodology Steps 1-3)* issued April 21, 2023, in this matter.

2. Fifth Methodology Order means the *Fifth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* issued in this matter on April 21, 2023

3. Fourth Methodology Order means the *Fourth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* issued April 19, 2016, in this matter.

4. Department means the Idaho Department of Water Resources.

5. Document means any tangible or electronic record, including but not limited to letters, emails, agreements, memoranda, notes, reports, minutes, books, ledgers, invoices, receipts, surveys, photographs, maps, drawings, diagrams, recordings, computer files or other form of data compilation, including duplicates, copies, substitutes, facsimiles, and summaries thereof.

6. ESPA means the Eastern Snake Plain Aquifer.

7. Person means any person or legal entity and its agents or employees.

8. You and your means the Department and its employees, officers, and staff.

REQUESTS FOR PRODUCTION OF DOCUMENTS

The Groundwater Users request that the following documents be provided in electronic format via email, thumb drive, or other digital medium. Alternatively, the documents shall be produced for inspection and copying at the office of the Department, 322 Front Street, Boise, Idaho.

Request for Production 1: Produce true and correct copies of all documents indicating when the Department first began considering a review and/or revision of the Fourth Methodology Order.

Request for Production 2: Produce true and correct copies of all documents indicated when the Department decided to proceed with a review and/or revision of the Fourth Methodology Order.

Request for Production 3: Produce true and correct copies of all documents relating to the Department's consideration of, in connection with the Fifth Methodology Order, the futile call doctrine, the policy of full economic development of underground water resources, the policy of reasonable use of water, or the policy of optimum development of water resources.

Request for Production 4: Produce true and correct copies of all documents relating to the Department's consideration of, in connection with the Fifth Methodology Order, the extent to which the water needs of the Surface Water Coalition or its members could be met with their existing facilities and water supplies by employing reasonable diversion and conveyance efficiency and conservation practices.

Request for Production 5: Produce true and correct copies of all documents generated, prepared, considered, discussed, utilized, reviewed, evaluated, analyzed, or relied upon by the Department in connection with development of the Fifth Methodology Order and/or the April 2023 As-Applied Order.

Request for Production 6: Produce true and correct copies of all letters, emails, text messages and other written correspondence sent by Department personnel to any person not employed by the Department, or received by Department personnel from any person not employed by the Department, prior to 6:45 p.m. mountain daylight time, April 21, 2023, concerning the Fifth Methodology Order, the April 2023 As-Applied Order, or the development, formulation, drafting, implication, application or effect of such orders.

Request for Production 7: Produce true and correct copies of all documents showing the actual or estimated total number of water rights that would be curtailed under the April 2023 As-Applied Order in the absence of approved mitigation plans.

Request for Production 8: Produce true and correct copies of all documents showing the number of water rights by beneficial use (irrigation, municipal, commercial, etc.) that would be curtailed under the April 2023 As-Applied Order in the absence of approved mitigation plans.

Request for Production 9: Produce true and correct copies of all documents showing the actual or estimated total number of acres authorized for irrigation that would be curtailed under the April 2023 As-Applied Order in the absence of approved mitigation plans.

Request for Production 10: Produce true and correct copies of all documents showing the actual or estimated total diversion rate (cubic feet per second) authorized for diversion under water rights that would be curtailed under the April 2023 As-Applied Order in the absence of approved mitigation plans.

Request for Production 11: Produce true and correct copies of all documents showing the actual or estimated total volume of water (acre-feet) authorized for diversion under water rights that would be curtailed under the April 2023 As-Applied Order in the absence of approved mitigation plans.

Request for Production 12: Produce true and correct copies of all documents relating to the extent, degree, or magnitude of beneficial use of water that would be curtailed under the April 2023 As-Applied Order in the absence of approved mitigation plans.

Request for Production 13: Produce true and correct copies of all documents relating to projected, estimated, or potential crop loss or any other impairment of beneficial use of water within Twin Falls Canal Company as a result of the 75,200 acre-feet Demand Shortfall predicted by the April 2023 As-Applied Order.

Request for Production 14: Produce true and correct copies of all documents comparing the adverse effects of curtailment under the Fifth Methodology Order and/or April 2023 As-Applied Order, in the absence of approved mitigation plan, on beneficial use of the ESPA versus the benefits of curtailment to Twin Falls Canal Company.

Request for Production 15: Produce true and correct copies of all documents that reference or reflect the Department's review or consideration, in connection with the Fifth Methodology Order and/or the As-Applied Order, of any alleged non-compliance with, or breach of, the so-called IGWA-Surface Water Coalition Settlement Agreement approved as a mitigation plan in IDWR Docket No. CM-MP-2016-001.

Request for Production 16: Produce true and correct copies of all documents showing the proportionate shares of the projected demand shortfall of 75,200 acre-feet set forth in the April 2023 As-Applied Orde attributable to, respectively, North Snake Ground Water District, Magic Valley Ground Water District, Carey Valley Ground Water District, Aberdeen-American Falls Area Ground Water District, Bingham Ground Water District, Bonneville-Jefferson Ground Water District, Jefferson-Clark Ground Water District, Madison Ground Water District, and Henry's Fork Ground Water District, and all documents showing the calculation of their proportionate shares.

Attorneys for the Idaho Department of Water Resources

BEFORE THE DEPARTMENT OF WATER RESOURCES

OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **DEPARTMENT'S RESPONSE TO GROUNDWATER USERS' REQUEST FOR PRODUCTION AND REQUEST FOR PUBLIC RECORDS**

This document contains the Idaho Department of Water Resources' ("Department") responses to the *Groundwater Users' First Set of Request for Production to IDWR; Or, Alternatively, Request for Public Records.*

GENERAL OBJECTIONS

1. The Department has not completed its own investigation. Accordingly, the responses that follow are based upon the best knowledge, information, and belief of the Department at this time. The Department reserves the right to make any further responses if it appears that any omission or error has been made in connection with these responses or that more accurate information has become available. These responses are made without prejudice to the Department's right to use such evidence as may later be discovered or evaluated.

2. The Department objects to any and all definitions, instructions and requests, or any part thereof, to the extent they call for material subject to the attorney-client privilege, the work product doctrine, investigative privilege or any other privilege, immunity or statutory prohibition. This objection applies to all production requests that seek such information. This objection is intended to apply to all of the requests that seek such information and will not be repeated for each request to which it applies. The Department has, to the extent possible, construed each request as requesting only information and/or documents not subject to any applicable protection.

3. The Department objects to any and all requests, or any part thereof, to the extent that they require identification of facts or information not relevant to the *Fifth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* ("Methodology Order") or the *Final Order Regarding April 2023 Forecast Supply* ("As-Applied Order") and are outside the scope of discovery. The responses are made subject to all objections as to competence, relevance, materiality, and admissibility.

4. The Department objects to any and all requests, or any part thereof, to the extent they purport to impose burdens on the Department in excess of those allowed by the Idaho Rules of Civil Procedure.

RESPONSES TO REQUESTS FOR PRODUCTION

Request for Production No. 1: Produce true and correct copies of all documents indicating when the Department first began considering a review and/or revision of the Fourth Methodology Order.

Response to Request for Production No. 1: Objection. The request calls for the production of documents protected by the attorney-client privilege and/or work product doctrine. Without waiving any objections, including the General Objections, the Department responds that documents the Department determines to be responsive will be posted to the Department's publicly available website. To access please visit: https://idwr.idaho.gov/legal-actions/delivery-call-actions/SWC/.

Request for Production 2: Produce true and correct copies of all documents indicated when the Department decided to proceed with a review and/or revision of the Fourth Methodology Order.

Response to Request for Production No. 2: Objection. The request calls for the production of documents protected by the attorney-client privilege and/or work product doctrine. Without waiving any objections, including the General Objections, the Department responds that documents the Department determines to be responsive will be posted to the Department's publicly available website. To access please visit: https://idwr.idaho.gov/legal-actions/delivery-call-actions/SWC/.

Request for Production 3: Produce true and correct copies of all documents relating to the Department's consideration of, in connection with the Fifth Methodology Order, the futile call doctrine, the policy of full economic development of underground water resources, the policy of reasonable use of water, or the policy of optimum development of water resources.

Response to Request for Production No. 3: The Department has no such documents at this time.

Request for Production 4: Produce true and correct copies of all documents relating to the Department's consideration of, in connection with the Fifth Methodology Order, the extent to which the water needs of the Surface Water Coalition or its members could be met with their existing facilities and water supplies by employing reasonable diversion and conveyance efficiency and conservation practices.

Response to Request for Production No. 4: The Department has no such documents at this time.

Request for Production 5: Produce true and correct copies of all documents generated, prepared, considered, discussed, utilized, reviewed, evaluated, analyzed, or relied upon by the Department in connection with development of the Fifth Methodology Order and/or the April 2023 As-Applied Order.

Response to Request for Production No. 5: Objection. The request calls for the production of documents protected by the attorney-client privilege and/or work product doctrine. The Department objects to this document request as overly broad and unduly burdensome. Without waiving any objections, including the General Objections, the Department responds that it already provided responsive documents when the Department posted technical analysis documents to the Department's publicly available website on May 5 and May 15, 2023. Additional documents the Department determines to be responsive will be posted to the Department's publicly available website. To access please visit: https://idwr.idaho.gov/legal-actions/delivery-call-actions/SWC/.

Request for Production 6: Produce true and correct copies of all letters, emails, text messages and other written correspondence sent by Department personnel to any person not employed by the Department, or received by Department personnel from any person not employed by the Department, prior to 6:45 p.m. mountain daylight time, April 21, 2023, concerning the Fifth Methodology Order, the April 2023 As-Applied Order, or the development, formulation, drafting, implication, application or effect of such orders.

Response to Request for Production No. 6: All documents the Department determines to be responsive will be posted to the Department's publicly available website. To access, please visit: https://idwr.idaho.gov/legal-actions/delivery-call-actions/SWC/.

Request for Production 7: Produce true and correct copies of all documents showing the actual or estimated total number of water rights that would be curtailed under the April 2023 As-Applied Order in the absence of approved mitigation plans.

Response to Request for Production No. 7: All documents the Department determines to be responsive will be posted to the Department's publicly available website. To access, please visit: https://idwr.idaho.gov/legal-actions/delivery-call-actions/SWC/.

Request for Production 8: Produce true and correct copies of all documents showing the number of water rights by beneficial use (irrigation, municipal, commercial, etc.) that would be curtailed under the April 2023 As-Applied Order in the absence of approved mitigation plans.

Response to Request for Production No. 8: All documents the Department determines to be responsive will be posted to the Department's publicly available website. To access, please visit: https://idwr.idaho.gov/legal-actions/delivery-call-actions/SWC/.

Request for Production 9: Produce true and correct copies of all documents showing the actual or estimated total number of acres authorized for irrigation that would be curtailed under the April 2023 As-Applied Order in the absence of approved mitigation plans.

Response to Request for Production No. 9: All documents the Department determines to be responsive will be posted to the Department's publicly available website. To access, please visit: https://idwr.idaho.gov/legal-actions/delivery-call-actions/SWC/.

Request for Production 10: Produce true and correct copies of all documents showing the actual or estimated total diversion rate (cubic feet per second) authorized for diversion under water rights that would be curtailed under the April 2023 As-Applied Order in the absence of approved mitigation plans.

Response to Request for Production No. 10: All documents the Department determines to be responsive will be posted to the Department's publicly available website. To access, please visit: https://idwr.idaho.gov/legal-actions/delivery-call-actions/SWC/.

Request for Production 11: Produce true and correct copies of all documents showing the actual or estimated total volume of water (acre-feet) authorized for diversion under water rights that would be curtailed under the April 2023 As-Applied Order in the absence of approved mitigation plans.

Response to Request for Production No. 11: All documents the Department determines to be responsive will be posted to the Department's publicly available website. To access, please visit: https://idwr.idaho.gov/legal-actions/delivery-call-actions/SWC/.

Request for Production 12: Produce true and correct copies of all documents relating to the extent, degree, or magnitude of beneficial use of water that would be curtailed under the April 2023 As-Applied Order in the absence of approved mitigation plans.

Response to Request for Production No. 12: All documents the Department determines to be responsive will be posted to the Department's publicly available website. To access, please visit: https://idwr.idaho.gov/legal-actions/delivery-call-actions/SWC/.

Request for Production 13: Produce true and correct copies of all documents relating to projected, estimated, or potential crop loss or any other impairment of beneficial use of water within Twin Falls Canal Company as a result of the 75,200 acre-feet Demand Shortfall predicted by the April 2023 As-Applied Order.

Response to Request for Production No. 13: The Department has no such documents at this time.

Request for Production 14: Produce true and correct copies of all documents comparing the adverse effects of curtailment under the Fifth Methodology Order and/or April 2023 As-Applied Order, in the absence of approved mitigation plan, on beneficial use of the ESPA versus the benefits of curtailment to Twin Falls Canal Company.

Response to Request for Production No. 14: The Department has no such documents at this time.

Request for Production 15: Produce true and correct copies of all documents that reference or reflect the Department's review or consideration, in connection with the Fifth Methodology Order and/or the As-Applied Order, of any alleged non-compliance with, or breach of, the so-called IGWA-Surface Water Coalition Settlement Agreement approved as a mitigation plan in IDWR Docket No. CM-MP-2016-001.

Response to Request for Production No. 15: Objection. Issues pertaining to IGWA's non-compliance with the Settlement Agreement are outside the scope of this proceeding. IGWA's compliance is a separate administrative proceeding in a separate docket – Docket No. CM MP 2016-001. Without waiving any objections, including the General Objections, the Department responds that it has no such documents at this time.

Request for Production 16: Produce true and correct copies of all documents showing the proportionate shares of the projected demand shortfall of 75,200 acre-feet set forth in the April 2023 As-Applied Orde[r] attributable to, respectively, North Snake Ground Water District, Magic Valley Ground Water District, Carey Valley Ground Water District, Aberdeen-American Falls Area Ground Water District, Bingham Ground Water District, Bonneville-Jefferson Ground Water District, Jefferson-Clark Ground Water District, Madison Ground Water District, and Henry's Fork Ground Water District, and all documents showing the calculation of their proportionate shares.

Response to Request for Production No. 16: The documents relevant to the calculation of IGWA's proportionate share of the predicted demand shortfall were posted to the Department's publicly available website on May 5, 2023. To access, please visit: https://idwr.idaho.gov/legal-actions/delivery-call-actions/SWC/. Regarding each Ground Water District's estimated distribution of proportionate shares, a table summarizing the results was provided to the parties in this case by email on May 5, 2023, at 4:14 pm. The supporting model files will be posted to the Department's publicly available website. To access, please visit: https://idwr.idaho.gov/legal-actions/delivery-call-actions/SWC/.

RESPONSE TO PUBLIC RECORDS REQUEST

Because the Department is providing the documents pursuant to the Groundwater Users' request for production, the Department will not be responding to the public records request. Moreover, public records requests are unavailable "to supplement, augment, substitute or supplant discovery procedures… ." Idaho Code § 74-115(3).

DATED this 18th day of May 2023.

GARRICK L. BAXTER
Deputy Attorney General
Idaho Department of Water Resources

BEFORE THE DEPARTMENT OF WATER RESOURCES

OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **CITIES' I.R.C.P 30(b)(6) NOTICE OF TAKING DEPOSITION DUCES TECUM OF TWIN FALLS CANAL COMPANY**

TO: Twin Falls Canal Company and its counsel of record:

PLEASE TAKE NOTICE that counsel for the Cities of Bliss, Burley, Carey, Declo, Dietrich, Gooding, Hazelton, Heyburn, Jerome, Paul, Richfield, Rupert, Shoshone, and Wendell ("Coalition of Cities"), by and through their attorneys of record, Candice M. McHugh and

Chris M. Bromley, the City of Idaho Falls, by and through its attorney of record, Robert L. Harris, and the City of Pocatello by and through its attorney of record Sarah A. Klahn (collectively the "Cities"), will take the deposition of the Twin Falls Canal Company ("TFCC") before M&M Court Reporting ("M&M") in accordance with the *Order Authorizing Discovery* issued on April 21, 2023, IDAPA 37.01.01.520.01.a and 37.01.01.520.02, and IRCP 26, 30(a), 30(b)(6), and 34. The deposition will commence at 10:00 a.m. on May 26, 2023, and continuing from day to day thereafter until completion, at the office of TFCC, 357 6th Ave. W., Twin Falls, Idaho. The deponent must be present in person. The court reporter will participate in person. Attorney may participate in person or via the Zoom video platform, hosted by M&M. Participants will receive a Zoom link via email from M&M the day before the deposition.

TFCC is required to designate one or more persons to testify on its behalf, and may set forth, for each person designated, the matters on which the person will testify, including but not limited to the following:

1. TFCC project efficiencies and how they have changed over time;
2. TFCC irrigation water distribution system, including how it has changed over time;
3. TFCC irrigation water delivery records including collection and maintenance of such records;
4. Identification of any and all acres within the TFCC service area that have been "hardened", i.e., can no longer produce crops due to the construction of permanent structures and/or acres that are enrolled in government programs, including but not limited to Conservation Reserve Program and/or Conservation Reserve Enhancement Program, thus foreclosing irrigation;
5. Information associated with TFCC farmer's reliance on sources of irrigation water other than deliveries from TFCC, including but not limited to supplemental and/or primary ground water wells;

6. Records related to releases at Spring Creek and other releases of water below Milner dam from the TFCC system;

7. Discharge data and information including points of discharge and volume records, NDPES documents and reports;

8. Records maintained by TFCC ditch riders and/or other TFCC employees engaged in distributing water to TFCC farmers;

9. Records related to private leases of storage water from TFCC to entities other than TFCC;

10. Records related to leases of storage water from TFCC to Water District 01;

11. Identification of and records related to installed hydropower projects within the TFCC service area that use water diverted by TFCC to generate power;

12. Records of TFCC board meetings;

13. Records of TFCC-related revenues associated with hydro-power generation; and

14. Information related to discussions with IDWR staff, attorneys or the Director regarding the SWC delivery call, IGWA's "breach", need to update the methodology and use of modelling to address injury to TFCC, and TFCC's need for water.

In addition to making a deponent(s) available to answer questions on these topics, the Cities request that the deponent(s) provide any and all supporting documentary materials related to the above topics in electronic format **three (3) days prior** to the scheduled deposition to facilitate efficient examination. To the extent this request is not practical for some reason, the Deponent must bring such documents to the deposition. Electronic format is preferred.

For purposes of this notice, the term "document" is to be interpreted as broadly as Idaho Rule of Civil Procedure 34 allows and includes all written or graphic matter, whether physical or electronic, however produced, including, but not limited to, letters, emails, text messages, notes, memoranda, meeting minutes, reports, directives, proposals, summaries, analyses, spreadsheets, internal communications, external communications, studies, surveys, working papers, and other

physical or electronic data of any kind. All parties and their counsel are invited to attend. The oral examination will continue from day to day until completed.

BEFORE THE DEPARTMENT OF WATER RESOURCES

OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **ORDER DENYING MOTION FOR RECONSIDERATION OF DENIAL OF CONTINUANCE**

BACKGROUND

On April 21, 2023, the Director of the Idaho Department of Water Resources ("Department") issued his *Fifth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* ("Methodology Order") and his *Final Order Regarding April 2023 Forecast Supply* ("As-Applied Order"). The Methodology Order revises the nine steps used to determine material injury to members of the Surface Water Coalition ("SWC"). The As-Applied Order predicts a shortfall for the 2023 irrigation season, which will result in mitigation requirements or curtailment for ground water rights with priority dates junior to December 30, 1953.

Anticipating that one or more parties would request a hearing pursuant to Idaho Code § 42-1701A(3) in response to one or both of the orders, the Director also issued a *Notice of Hearing, Notice of Prehearing Conference, and Order Authorizing Discovery* ("Notice of Hearing") on April 21, 2023. The Notice of Hearing scheduled a prehearing conference for April 28, 2023, and an in-person evidentiary hearing on the Methodology Order and As-Applied Order for June 6–10, 2023.

Immediately before the April 28, 2023 prehearing conference, the Cities of Bliss, Burley, Carey, Declo, Dietrich, Gooding, Hazelton, Heyburn, Idaho Falls, Jerome, Paul, Pocatello, Richfield, Rupert, Shoshone, and Wendell (collectively the "Cities") filed a *Motion for Continuance* requesting that the Director continue the June 6-10 evidentiary hearing "until a date in December or January 2024 . . . ." Mot. for Continuance at 8.

During the April 28, 2023 prehearing conference, the Cities presented argument in support of their *Motion for Continuance*. The Idaho Ground Water Appropriators, Inc. ("IGWA"), Bonneville-Jefferson Groundwater District ("BJGD"), and McCain Foods orally moved to join the Cities' *Motion for Continuance*. The Cities requested that the hearing be delayed approximately six months. *Id*. The Cities asserted that additional time is needed to conduct discovery, prepare witnesses, properly evaluate the updated Methodology Order and As-Applied Order, and because one of its attorneys (Ms. Candice McHugh) will be unable to appear in person June 6–10. *Id*. at 4–6. The Cities further asserted the Director should grant their

request because no exigency exists given the above-average snowfall this year. *Id*. at 6–8. The SWC opposed the Cities' motion, arguing the hearing should remain as scheduled on June 6–10, 2023.

The Director orally denied the Cities' request to delay the hearing until December or January 2024. The Director stated he was, however, willing to move the hearing anytime within the first three weeks of June 2023 if all the parties agreed to move the hearing. In denying the Cities' request, the Director emphasized his court-ordered obligation to timely predict water supplies and issue orders timely to ensure senior water right holders are protected.

On May 5, 2023, the Director issued an *Order Denying the Cities' Motion for Appointment of Independent Hearing Officer and Motion for Continuance and Limiting Scope of Depositions* ("Order Denying Motion to Continue"). In the order, the Director memorialized his oral denial of the Motion for Continuance but advised that he was willing to move the hearing within the first three weeks of June 2023 if the parties filed a stipulated motion requesting the change. *Order Denying Motion to Continue* at 2. By separate order, the Director authorized Ms. McHugh to appear at the hearing remotely. Scheduling Order and Order Authorizing Remote Appearance at Hr'g at 3.

On May 5, 2023, the Cities of Bliss, Burley, Carey, Declo, Dietrich, Gooding, Hazelton, Heyburn, Idaho Falls, Jerome, Paul, Pocatello, Richfield, Rupert, Shoshone, and Wendell along with IGWA, BJGD, and Bingham Groundwater District (collectively the "Groundwater Users") filed a *Motion for Reconsideration of Denial of Continuance* ("Motion for Reconsideration") asking the Director to reconsider his order denying the request to continue the hearing. In support of its Motion for Reconsideration, the Groundwater Users filed declarations from the following individuals: Candice McHugh, counsel for the Coalition of Cities, Amalgamated Sugar Company, and McCain Foods; Skyler Johns, Counsel for BJGD; Thane Kindred and Bryce Contor, experts for BJGD; and Sophia Sigstedt and Jaxon Higgs, experts for IGWA.

On May 8, 2023, the SWC filed *Surface Water Coalition's Opposition to Groundwater Users' Motion for Reconsideration of Order Denying Motion for Continuance* ("Objection").

ANALYSIS

Rule 560 of the Department's Rules of Procedure grants the presiding officer the discretion to continue a proceeding. IDAPA 37.01.01.560. Rules 710 and 711 advise that scheduling orders are interlocutory orders, and that the presiding officer has the discretion to "rescind, alter or amend any interlocutory order…". IDAPA 37.01.01.710–711.

A. Unavailability of Counsel and Experts.

The Groundwater Users contend the June 6–10 hearing should be continued due to the unavailability of numerous witnesses and an attorney. *Motion for Reconsideration* at 3–5. The Groundwater Users further contend that a failure to continue the hearing will result in prejudice to the Groundwater Users. *Id.* at 5. To support their unavailability argument, the Groundwater Users submitted declarations from the following individuals:

Jaxon Higgs. Mr. Higgs is a hydrogeologist who provides technical analysis to IGWA. Decl. of Jaxon Higgs ¶¶ 3, 4. Mr. Higgs advises that he will be on a road trip vacation in Mexico from May 27–June 10 and will be unavailable to attend the hearing on June 6-10. *Id*. ¶ 7.

Sophia Sigstedt. Ms. Sigstedt is a hydrogeologist who provides technical analysis to IGWA. Decl. of Sophia Sigstedt ¶¶ 2, 3. Ms. Sigstedt advises she is dealing with a medical condition that prohibits her from leaving her home state of Colorado until July 10, 2023, and limits the amount of work she can perform during this time. *Id*. ¶ 15.

Candice McHugh. Ms. McHugh is an attorney representing the Coalition of Cities, Amalgamated Sugar, and McCain Foods. Decl. of Candice McHugh ¶ 2. Ms. McHugh advises that her partner Chris Bromley has an argument before the Idaho Supreme Court on June 5, and will need the week of May 29 to prepare for that argument. *Id*. Ms. McHugh advises that she will be out of state from June 4–8, and that she will be flying "virtually all day" on June 4 and June 8. *Id*. ¶ 6. Ms. McHugh contends that, given their schedules, she and Mr. Bromley will be unable to fully and fairly represent their clients if the hearing is held on June 6–10. Decl. of Candice McHugh ¶ 7.

In response, the SWC points out that the Department has already authorized Ms. McHugh to appear remotely to accommodate her travel, and that the SWC would stipulate to Ms. Sigstedt's appearing remotely to accommodate her medical condition. *Objection* at 8–9 n.8.

The Director recognizes that some flexibility with witnesses and attorneys is necessary. Ms. McHugh has already been granted the ability to appear remotely. Mr. Bromley, Ms. McHugh's law partner, will be available to attend on the one day that Ms. McHugh will be traveling and unavailable. Clients of the McHugh Bromley law firm will have representation during all days of the hearing. Regarding the participation by experts, the Director will authorize Ms. Sigstedt and Mr. Higgs to participate in the hearing remotely.

B. Insufficient time to prepare.

The Groundwater Users next assert that the June 6–10 hearing should be continued because they are without sufficient time to prepare, resulting in prejudice. *Motion for Reconsideration* at 5–6. To support this claim, the Groundwater Users submitted declarations from the following individuals:

Greg Sullivan. Mr. Sullivan is an expert for the Coalition of Cities and the City of Pocatello. Decl. of Greg Sullivan ¶¶ 3–5. Mr. Sullivan asserts he will be on a trip in Europe from May 17–June 3, leaving him an insufficient amount of time to prepare for a hearing. *Id*. ¶¶ 20–21.

Mr. Sullivan estimates he needs 3–5 months to prepare for the hearing. *Id*. ¶ 25.

Bryce Contor. Mr. Contor is a hydrologist who consults for BJGWD. Decl. of Bryce Contor ¶¶ 2, 6. Mr. Contor asserts he does not have time to perform an adequate technical review of the information prior to the hearing. *Id*. ¶¶ 8, 10.

Thane Kindred. Mr. Kindred is a geologist hired by BJGWD to provide technical advice and conduct a comprehensive review of the Methodology Order. Decl. of Thane Kindred ¶¶ 3, 5. Mr. Kindred advises he will not have sufficient time to conduct his review prior to the June 6–10 hearing. *Id*. ¶¶ 5, 7. Mr. Kindred further advises he does not have all the information he needs and will need at least two months to conduct his analysis. *Id*. ¶¶ 5, 7.

Sophia Sigstedt. Ms. Sigstedt is a hydrogeologist who provides technical analysis to IGWA. Decl. of Sophia Sigstedt ¶¶ 2, 3. Ms. Sigsted advises she would like to analyze *inter alia* the number of acres irrigated by the Twin Falls Canal Company, the Forecast Supply Predictors from 1900–2022, and whether the data supports the Director's decision to use 2018 as the Baseline Year. *Id*. ¶¶ 8–10. Ms. Sigstedt advises she lacks sufficient time to conduct her analysis prior to the hearing on June 6–10, and further advises she will need until October of 2023 to complete her work. *Id*. ¶ 14.

Skyler Johns. Mr. Johns is an attorney for BJGWD. Decl. of Skyler Johns ¶¶ 2. Mr. Johns asserts he did not receive "formal notice" from the Department that it would transition from steady-state to transient-state analysis. *Id*. ¶ 5. Mr. Johns advises that neither himself nor his experts were part of the technical working group. *Id*. Mr. Johns further advises that as of the date he signed his declaration (May 5, 2023), he did not have access to all the documents he needs to conduct a review and prepare his legal arguments. *Id*. ¶ 7. Mr. Johns contends he will need at least 6 months to prepare for the hearing, and that without such time his clients will be prejudiced. *Id*. ¶¶ 8–10.

Candice McHugh. Ms. McHugh is an attorney representing the Coalition of Cities, Amalgamated Sugar, and McCain Foods. Decl. of Candice McHugh ¶ 2. Ms. McHugh further advises that "[t]he hearing as currently set will not allow me to assist or attend the hearing in any meaningful manner and prejudices the interest of McHugh Bromley, PLCC's clients." *Id*. ¶ 9.

The SWC responds that six weeks is plenty of time to prepare for a hearing, as evidenced by the fact that the First Methodology Order in this exact case was issued on April 7, 2010, with

an evidentiary hearing held on May 24, 2010. *Objection* at 7–8. The SWC further advises that this type of scheduling in a conjunctive management administration should surprise no one. *Id*.

While the Director recognizes that the current schedule may be a burden on the parties, it is a burden being born by all parties, both the senior water users and the junior ground water users. Plus, an accelerated schedule is not unheard of in water administrative proceedings. Furthermore, while Bonneville- Jefferson Groundwater District has decided to hire new counsel and hire its own new experts, this does not justify a continuance. BJGD has long been a party to this proceeding. The Director will not allow a junior ground water user that has long been a party to the proceeding to delay administration because new counsel and experts are hired.

The ground water users claim being surprised by changes to the Methodology Order. In the fall of 2022, the Department conducted multiple presentations regarding possible amendments to the *Fourth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* ("Fourth Methodology Order"). The Director also publicly expressed his intention to update the Fourth Methodology Order. The parties were notified that the Director was considering changes and the issues being considered by the Director. The Department distributed data, technical analysis, and recommendations to the parties' technical experts. For some of the Department presentations, the experts submitted comments to the Department on the proposed changes. As the declarations show, the experts for IGWA and the Cities have represented those entities for many years. The experts have a familiarity with the methodology order. After considering the need of the senior water user to have timely administration versus the ground water users desire to have more time to prepare for hearing, the Director will adhere to the current schedule.

C. Current Conditions and Lack of prejudice to Groundwater Users.

In both their Motion for Continuance and Motion for Reconsideration, the Groundwater Users argue that there will be no prejudice to the senior surface water users this year because of high snowpack. The Director disagrees that high snowpack means the SWC will not be injured. While there is a good snowpack in the hills above the ESPA, snowpack is only part of the SWC's water supply, and recharge from the aquifer is at a record low. Additionally, southern Idaho is emerging from a two-year drought, and the existing storage supply going into this irrigation season is low. Forecasters are uncertain whether the storage supply system will fill this year. The Director agrees with the SWC that the "current snowpack does not tell the whole story." *Objection* at 9–10.

The Groundwater Users also contend that they have provided "sufficient mitigation this season so little to no injury will occur to the senior users." *Motion for Reconsideration* at 3. Citing to IGWA's *Notice of Ground Water District Mitigation* ("Notice of Mitigation"), the Groundwater Users argue that IGWA has "enough water to mitigate for its 2021 breach and for the predicted shortfall for the upcoming 2023 season." *Id*. at 6. The Groundwater Users state, "[G]iven the fact that IGWA has enough water for this season to offset the entire injury forecasted to [Twin Falls Canal Company] … the Director should consider that the junior water users 'as a whole' are complying with mitigation plans." *Id*. at 7.

The problem with this argument is that IGWA's Notice of Mitigation does not say that it is agreeing to provide storage water "to offset the entire injury forecasted to [Twin Falls Canal Company]." IGWA's Notice of Mitigation states that it is acting on behalf of its member ground water districts and that IGWA is mitigating for its districts' "proportionate share" of the demand shortfall. *Notice of Mitigation* at 1–3.

But even more important, the Director is currently reviewing IGWA's Notice of Mitigation to determine whether the proposal would mitigate for the 2023 demand shortfall to the SWC. The Notice of Mitigation has several potential shortcomings:(1) Instead of relying on one single mitigation plan for all members, individual ground water districts are seeking to mitigate under different mitigation plans. This "hybridization" of mitigation plans presents serious questions about whether mixing of mitigation plans is allowable and whether there is compliance with a mitigation plan at all. (2) One of the mitigation plans, proposed in 2009 and approved in 2010, could be read to require IGWA, not individual ground water districts, to supply the entire demand shortfall to the SWC from rented storage water. The 2010 order approving the mitigation plan does not recognize a reduced mitigation obligation for IGWA based on IGWA's share of the mitigation obligation. Furthermore, the approved 2010 mitigation plan does not recognize an additional division of IGWA's obligation into fractional mitigation components for each of IGWA's members. (3) The ground water districts wanting to mitigate pursuant to the 2016 Stipulated Mitigation Plan have proportionately determined their individual obligations. But the mitigation plan does not recognize proportionate sharing of the storage water component. Further, the ground water districts are ignoring the additional requirement of an additional 30,000 acre-feet of storage to be rented for mitigation that was a component of an agreement to cure a breach of the 2016 Stipulated Mitigation Plan. (4) Jefferson-Clark Groundwater District is claiming to mitigate with storage water but none of the storage water agreements presented to the Director are in the name of Jefferson-Clark Groundwater District. (5) The Notice of Mitigation was filed by Thomas Budge on behalf of all IGWA members and purports to provide storage agreements for BJGWD and BGWD. Yet both BJWD and BGWD have recently hired independent counsel. It is unclear therefore whether IGWA's Notice of Mitigation would bind BJGWD and BGWD. Moreover, as the SWC observes, there are concerns about whether IGWA breached the 2016 Stipulated Mitigation Plan. In conclusion, it is far from clear that the IGWA's Notice of Mitigation complies with the requirements of an approved mitigation plan.

The Director has a responsibility to timely respond to injury incurred by senior water users and there should be no unnecessary delays in that process. *Am. Falls Reservoir Dist. No. 2 v. Idaho Dep't of Water Res.*, 143 Idaho 862, 874, 154 P.3d 433, 445 (2007). "Clearly, a timely response is required when a delivery call is made and water is necessary to respond to that call." *Id*. The Department also agrees with the SWC that "[i]n practice, an untimely decision effectively becomes the decision; i.e. no decision is the decision." *Objection* at 3 (citing *Order on Plaintiffs' Motion for Summary Judgment* at 97 (*AFRD#2 et al. v. IDWR*, No. CV-2006-600 (Gooding County Dist. Ct. Idaho June 2, 2006)). The Director will not be issuing a curtailment order until after a hearing in this matter so that junior ground water users have the opportunity for a hearing before being curtailed. To ensure timely administration for predicted material injury in this current irrigation season, the Director cannot agree to continue the hearing beyond

June. The Director reiterates that he is willing to work with the parties to move the hearing to any time within the first three weeks of June 2023.[1]

ORDER

Based on the forgoing discussion, IT IS HEREBY ORDERED that the Groundwater Users' *Motion for Reconsideration of Denial of Continuance* is DENIED.

IT IS FURTHER ORDERED that Sophia Sigstedt and Jaxon Higgs may appear virtually by video link on June 6–10, 2023. Sarah Tschohl, on behalf of the Department, will email the remote participation link to Ms. Sigstedt and Mr. Higgs no later than May 30, 2023.

DATED this 19th day of May 2023.

Gary Spackman
Director

[1] The Groundwater Users allege that the Director has "delegated to the SWC the ability to veto a continuance to a reasonable hearing date." *Motion for Reconsideration* at 7. This is inaccurate. Consistent with the obligation to timely respond, the Director settled on a hearing date that would provide the parties time to prepare for hearing but also allow for curtailment during this irrigation season if necessary. The Director has repeatedly expressed his willingness reset the hearing within the first three weeks of June.

CERTIFICATE OF SERVICE

BEFORE THE DEPARTMENT OF WATER RESOURCES

OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **CITIES' AMENDED I.R.C.P 30(b)(6) NOTICE OF TAKING DEPOSITION DUCES TECUM OF TWIN FALLS CANAL COMPANY**

TO: Twin Falls Canal Company and its counsel of record:

PLEASE TAKE NOTICE that counsel for the Cities of Bliss, Burley, Carey, Declo, Dietrich, Gooding, Hazelton, Heyburn, Jerome, Paul, Richfield, Rupert, Shoshone, and Wendell ("Coalition of Cities"), by and through their attorneys of record, Candice M. McHugh and

Chris M. Bromley, the City of Idaho Falls, by and through its attorney of record, Robert L. Harris, and the City of Pocatello by and through its attorney of record Sarah A. Klahn (collectively the "Cities"), will take the deposition of the Twin Falls Canal Company ("TFCC") before M&M Court Reporting ("M&M") in accordance with the *Order Authorizing Discovery* issued on April 21, 2023, IDAPA 37.01.01.520.01.a and 37.01.01.520.02, and IRCP 26, 30(a), 30(b)(6), and 34. The deposition will commence at 10:00 a.m. on May 25, 2023, and continuing from day to day thereafter until completion, at the office of TFCC, 357 6th Ave. W., Twin Falls, Idaho. The deponent must be present in person. The court reporter will participate in person. Attorney may participate in person or via the Zoom video platform, hosted by M&M. Participants will receive a Zoom link via email from M&M the day before the deposition.

TFCC is required to designate one or more persons to testify on its behalf, and may set forth, for each person designated, the matters on which the person will testify, including but not limited to the following:

1. TFCC project efficiencies and how they have changed over time;
2. TFCC irrigation water distribution system, including how it has changed over time;
3. TFCC irrigation water delivery records including collection and maintenance of such records;
4. Identification of any and all acres within the TFCC service area that have been "hardened", i.e., can no longer produce crops due to the construction of permanent structures and/or acres that are enrolled in government programs, including but not limited to Conservation Reserve Program and/or Conservation Reserve Enhancement Program, thus foreclosing irrigation;
5. Information associated with TFCC farmer's reliance on sources of irrigation water other than deliveries from TFCC, including but not limited to supplemental and/or primary ground water wells;

6. Records related to releases at Spring Creek and other releases of water below Milner dam from the TFCC system;

7. Discharge data and information including points of discharge and volume records, NDPES documents and reports;

8. Records maintained by TFCC ditch riders and/or other TFCC employees engaged in distributing water to TFCC farmers;

9. Records related to private leases of storage water from TFCC to entities other than TFCC;

10. Records related to leases of storage water from TFCC to Water District 01;

11. Identification of and records related to installed hydropower projects within the TFCC service area that use water diverted by TFCC to generate power;

12. Records of TFCC board meetings;

13. Records of TFCC-related revenues associated with hydro-power generation; and

14. Information related to discussions with IDWR staff, attorneys or the Director regarding the SWC delivery call, IGWA's "breach", need to update the methodology and use of modelling to address injury to TFCC, and TFCC's need for water.

In addition to making a deponent(s) available to answer questions on these topics, the Cities request that the deponent(s) provide any and all supporting documentary materials related to the above topics in electronic format **three (3) days prior** to the scheduled deposition to facilitate efficient examination. To the extent this request is not practical for some reason, the Deponent must bring such documents to the deposition. Electronic format is preferred.

For purposes of this notice, the term "document" is to be interpreted as broadly as Idaho Rule of Civil Procedure 34 allows and includes all written or graphic matter, whether physical or electronic, however produced, including, but not limited to, letters, emails, text messages, notes, memoranda, meeting minutes, reports, directives, proposals, summaries, analyses, spreadsheets, internal communications, external communications, studies, surveys, working papers, and other

physical or electronic data of any kind. All parties and their counsel are invited to attend. The oral examination will continue from day to day until completed.

DATED this 22nd day of May, 2023.

BEFORE THE DEPARTMENT OF WATER RESOURCES

OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **MOTION TO RE-SET HEARING DATES**

COME NOW, the Cities of Bliss, Burley, Carey, Declo, Dietrich, Gooding, Hazelton, Heyburn, Jerome, Paul, Richfield, Rupert, Shoshone, and Wendell ("Coalition of Cities"), by and through their attorneys of record, Candice M. McHugh and Chris M. Bromley, the City of Idaho Falls, by and through its attorney of record, Robert L. Harris, and the City of Pocatello by and through its attorney of record Sarah A. Klahn (collectively the "Cities"), Idaho Ground Water Appropriators ("IGWA") by and through its attorney of record Thomas J. Budge,

Bingham Ground Water District by and through its attorney, Dylan Anderson and Bonneville-Jefferson Ground Water District, by and through its attorney Skyler Jones, (collectively the "Parties') and request the hearing dates for the above captioned matter be moved to June 19-23, 2023..

As stated in his recent *Order Denying Motion for Reconsideration of Denial of Continuance*, ("Order Denying Reconsideration") the Director states that "he is willing to work with the parties to move the hearing to anytime within the first three weeks of June 2023." Id. at 6.[1] The Director stated that a hearing within the month of June will "ensure timely administration for predicted material injury in this current irrigation season." *Id.* While the Parties to this Motion do not believe that moving the hearing dates back comport with the necessary due process this case requires and do not hereby waive any arguments relative to the process, the Parties believe that moving the hearing date back is needed and necessary for them to better prepare and accommodate their experts. The Parties conferred with counsel for the Surface Water Coalition but could not reach agreement on a continuance.

The bases for Parties' request to re-set the hearing to June 19-23 are as follows:

1. IGWA's expert, Jaxon Higgs will be available for hearing, whereas currently he will be out of the country. See previously filed Declaration of Higgs. Re-setting the dates will at least allow one of IGWA's experts to attend the hearing in-person which is vital to effectively assist at hearing and evenings. Currently, none of IGWA's experts can attend the hearing in person. Id. See too previously filed Declaration of Sigstedt.

2. The Cities' expert, Greg Sullivan returns on June 2 from an overseas trip. By

[1] To be clear, counsel for IGWA and counsel for the Cities on multiple separate occasions tried to get the SWC to agree to move the hearing to a more reasonable time period but were met with either outright denials or other requests that impeded the ability to reach agreement among all the parties.

resetting the hearing to June 19, Mr. Sullivan will be available to assist the Cities with trial preparation. In addition, Mr. Sullivan's expert report would be due June 12 which gives him 10 days to finalize such report upon his return, whereas currently his report is due when he is out of the country. See previously filed Declaration of Sullivan.

3. The Cities' counsel, Candice McHugh will be available to both assist in witness preparation and to attend the hearing in person. See previously filed Declaration of McHugh.[2]

4. The Cities have filed a *Petition for Judicial Review* and *Motion for Stay Based on IDWR's Interference with Lawful Discovery* and *Complaint for Declaratory Relief and Writ of Prohibition and Petition for Writ of Mandamus*. Resetting the hearing to June 19 will allow due consideration of the pending Complaint and Writ Action.

5. IGWA and the GWDS have filed a *Petition for Judicial Review* and have also filed: Ground Water Districts' *Motion to Compel, Ground Water Districts' Motion for Order to Show Cause, Ground Water Districts' Motion for Stay, Ground Water Districts' Motion for Injunctive Relief, Ground Water Districts' Motion for Expedited Decision*. Moving the hearing dates back will allow due consideration of the various Motions.

CONCLUSION

Based on the foregoing, the Parties to this Motion request that the Director re-set the hearing dates as requested.

In addition, the Parties to this Motion recognize that the Surface Water Coalition has a right to respond to this motion but given the compressed hearing schedule, the Parties request

[2] The resetting will also facilitate Mr. Bromley's preparation for the Supreme Court argument on June 5 in the Basin 37 matter.

that the Director order them to respond by the end of business Wednesday, May 23, 2023, and issue an order on this Motion by Friday, May 26, 2023.

Submitted this 22nd day of May, 2023.

IN THE MATTER OF THE DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY AND FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **GROUND WATER DISTRICTS' I.R.C.P. 30(b)(6) NOTICE OF TAKING DEPOSITION DUCES TECUM OF TWIN FALLS CANAL COMPANY**

To: Twin Falls Canal Company and its counsel of record:

PLEASE TAKE NOTICE that counsel for Idaho Ground Water Appropriators, Inc., Bingham Ground Water District, and Bonneville-Jefferson Ground Water District will join in taking the deposition of Twin Falls Canal Company ("TFCC") as set forth in the *Cities' I.R.C.P. 30(b)(6) Notice of Taking Deposition Duces Tecum of Twin Falls Canal Company* served May 19, 2023, in this matter. Please provide to said counsel via email by 12:00 p.m. May 24, 2023, copies of all documents requested in the Cities' deposition notice. In addition to documents responsive to Cities' deposition notice, please provide the following:

A. A map, image, schematic, diagram, survey, or other such illustrative document of TFCC's water storage and delivery system;
B. Copies of any document reporting or cataloging TFCC's spill sites and the measurements relating to TFCC's spill sites;
C. An Idaho Department of Water Resources ("IDWR") water report and map for each water right owned by TFCC;
D. An IDWR water report and map for each water right delivered through TFCC's water storage and delivery system that is not owned by TFCC;
E. Copies of TFCC's bylaws and any other company governing guidelines, rules, articles, or documents;
F. Copies of all water delivery agreements, wheeling agreements, and other agreements by which TFCC delivers water under water rights not owned by TFCC;
G. A copy of the 2006 Settlement Agreement among the canal companies;
H. Copies of all letters, agreements, memoranda, and other documents between TFCC and Idaho Power Company, or any other power company, relating directly or indirectly to the delivery of water through TFCC's water storage and delivery system, the discharge of water from TFCC's water storage and delivery system, or the generation of hydropower using TFCC's water storage and delivery system.

For the purposes of this notice, the term "document" is the same as that described in the Cities' deposition notice.

Attorneys for American Falls Reservoir District #2 and Minidoka Irrigation District

BEFORE THE DEPARTMENT OF WATER RESOUCES

OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **SURFACE WATER COALITION'S OPPOSITION TO GROUNDWATER USERS' MOTION TO RE-SET HEARING DATES**

COME NOW, A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, and TWIN FALLS CANAL COMPANY ("Surface Water Coalition," "Coalition," or "SWC"), by and through counsel of record, and pursuant to the Department's Rules of Procedure (IDAPA 37.01.01.220) hereby file the following response in opposition to the *Motion to Re-set Hearing*

Dates ("*Motion*") filed jointly by the Coalition of Cities, Cities of Idaho Falls and Pocatello, the Idaho Ground Water Appropriators, Inc. ("IGWA"), Bonneville-Jefferson Ground Water District, and Bingham Ground Water District (hereinafter collectively referred to as "Groundwater Users") on May 22, 2023. This response is supported by the attached exhibits and the *Declaration of David Colvin* filed together herewith. For the reasons set forth below, the Director should deny the Groundwater Users' motion, again.

BACKGROUND / APPLICABLE RULE

The Groundwater Users identify no basis or applicable rule for their present "motion." Presumably it is a second motion for reconsideration of the Director's denial of their original motion for continuance. As indicated in the *Order Denying Motion for Reconsideration of Denial of Continuance* ("*Reconsideration Order*"), the Director has discretion to "rescind, alter or amend any interlocutory order" pursuant to Rules 710 and 711. *See* IDAPA 37.01.01.560. For the reasons contained in that *Order* and as set forth below, the Director should again deny the present effort to delay the hearing in this case.

The Surface Water Coalition submits the Director properly exercised his discretion in denying the Groundwater Users' repeated requests and that there is nothing in the present *Motion* that would warrant reconsidering the prior reasoning or decisions.

ARGUMENT

I. The Groundwater Users Offer No New Facts or Argument Warranting a Delay in this Hearing and Ultimately Conjunctive Administration of Junior Priority Ground Water Rights During the 2023 Irrigation Season.

The Groundwater Users offer no new facts that would justify any further delay in this case. Instead, they repeat the same claims the Director fully considered and addressed in the *Reconsideration Order*. *See generally*, *Motion* at 2-3. While the Director provided for remote

participation for consultants that cannot travel to Idaho or will be voluntarily out-of-state at that time, that accommodation is overlooked.[1] *See Order* at 7. The Groundwater Users are familiar with remote participation as evidenced by their counsel's participation in the depositions of IDWR staff last week as well as their consultants full participation in the Technical Work Group meetings hosted by the Department over a six-week period beginning in November of 2022. In fact, it was at those meetings where information was presented that ultimately resulted in the modifications to the Methodology in the *Fifth Order*.

The Groundwater Users ask the Director to move the hearing presently set for June 6-10 to June 19-23.[2] *Motion* at 2. However, even with this delay they "do not believe that moving the hearing dates back comport with necessary due process this case requires and do not hereby waive any arguments relative to the process." *Id.* In other words, the Groundwater Users admittedly really don't believe moving the hearing two weeks matters or addresses the concerns alleged. Perhaps if the requested "re-set" acknowledged satisfaction of alleged due process concerns, the motion and its basis would look differently. However, they make no such claim. The reality is as pointed out in the Groundwater Users' briefing is that they want the delay, not to prepare for hearing, <u>but to primarily provide more time for the processing of their district court filings</u>.

[1] The Groundwater Users' request to move the hearing to June 19th would still require Ms. Sigstedt to participate remotely as she indicated she could not travel out-of-state until mid-July. *See Sigstedt Dec.* Accordingly, that is not a reason to reconsider the Director's order. Moreover, IGWA admits that "Jaxon Higgs will be available for hearing." *Motion* at 2. Even though Mr. Higgs "will be out of the country," the Director's remote accommodation addresses that concern. *See Order* at 7. Mr. Higgs does not indicate where he will be in Mexico but presumably he would be located in either the Mountain or Central time zone, i.e. a one hour difference from Boise, Idaho.

[2] The Coalition disputes the Groundwater Users' characterization of their discussions concerning moving the hearing date. *See Motion* at 2, n. 1. Each time the Groundwater Users' counsel requested moving the hearing, counsel for the Coalition advised of the problems with delaying administration to their clients' senior water rights and the fact that IGWA's *Notice of Mitigation* did not cover all affected junior ground water rights. As acknowledged by the Director, senior water right holders are entitled to timely administration and the schedules of counsel and consultants do not trump that statutory duty.

Since the denial of their original motion for reconsideration the Groundwater Users have filed three separate lawsuits against the Director and the Department in Ada County District Court. *See generally, IGWA et al. v. IDWR*, Case No. CV01-23-8187; *City of Pocatello et al. v. IDWR*, Case No. CV01-23-8258; *City of Pocatello et al. v. IDWR*, Case No. CV01-23-8306. In those actions the Groundwater Users seek among other relief, a stay, injunctive relief, and writs of mandamus and prohibition. Despite exercising their statutory rights and requesting an administrative hearing on the Director's *Fifth Order* pursuant to Idaho law, the Groundwater Users now ask the Director to delay that hearing in order to accommodate their lawsuits against the State of Idaho. *Motion* at 3 ("[r]esetting the hearing to June 19 will allow due consideration of the pending Complaint and Writ Action"). Stated another way, the Groundwater Users are not declaring the two-week delay would satisfy their due process claims, but instead are effectively asking the Director to voluntarily delay the administrative case proceeding so that the district court might enjoin it altogether. Whereas the State of Idaho and all parties involved will likely spend significant time and resources on these cases and the multitude of motions, it is likely such matters will be dismissed as a matter of law. *See e.g. Order Denying Application for Temporary Restraining Order* (*SVGWD v. IDWR*, Blaine County Dist. Ct., Fifth Jud. Dist., Case No. CV07-21-243, May 27, 2021); *Order Granting Motion to Dismiss* (*IGWA v. IDWR*, Jerome County Dist. Ct., Fifth Jud. Dist., Case No. CV27-22-945, Dec. 8, 2022) ("Since IGWA has an adequate administrative remedy available to it which has not been exhausted under Idaho Code § 42-1701A(3), its *Petition* must be dismissed"). The Director should see through the Groundwater Users' requested "re-set" for what it is, a delay tactic that will cost all parties substantial resources and attorneys fees, and deny it accordingly.

Most importantly, as noted before, any delay in the hearing would effectively delay conjunctive administration during the 2023 irrigation season. *See generally*, *SWC Opposition to Groundwater Users' Motion for Reconsideration* (May 8, 2023). Whereas the Ground Water Districts' breach of the 2021 Stipulated Mitigation Plan took several months to address, it created great concern for potential curtailment at the end of the growing season. Any additional delay in this hearing has the potential to re-create that same situation, including for groundwater users that do not have an approved mitigation plan.

Indeed, the Director has stated that he "will not be issuing a curtailment order until after a hearing in this matter so that junior ground water users have the opportunity for a hearing before being curtailed." *Order* at 6. This may include addressing the Ground Water Districts' 2022 breach of the Stipulated Mitigation Plan. Although over-pumping by certain Districts last year will have continuing impacts on the Snake River into this irrigation season, any delay in administration could reduce the effectiveness of any curtailment remedy if necessary.

For example, even if the Director issued a final order within a week of the close of the scheduled hearing, any actual curtailment could be delayed beyond that timeframe. For example, in 2022, after issuing the Steps 1-3 As Applied Order on April 20, 2022 forecasting a projected injury of 162,000 acre-feet, the Director stated that junior ground water users who did not establish their ability to mitigate by May 1, 2022 would be curtailed effective at 12:01 a.m. on May 20, 2022. *See Final Order Curtailing Ground Water Rights Junior to December 25, 1979* (CM-DC-2010-001; May 5, 2022). In other words, the actual curtailment was ordered to occur approximately two (2) weeks after the order was issued.[3] If a similar schedule were to apply here, delaying the hearing to June 19-23 could foreseeably forestall any required curtailment to

[3] The Director has ordered curtailment to occur sooner within the issuance of an order following hearing as evidenced in the Basin 37 administration case. *See Final Order* (Docket No. AA-WRA-2021-001, June 28, 2021).

the middle of July. This sort of delay in administration is unacceptable to the Coalition and their landowners and shareholders, particularly for entities like TFCC that typically rely solely on reach gains from ESPA aquifer discharges for the source of their natural flow water rights. Given the trends over the last several years, it is likely that natural flow declines will continue and would not satisfy increasing irrigation demands throughout the summer.

Further, the Director aptly highlighted the problems and issues with IGWA's *Notice of Mitigation*. *See Order* at 6. Again, IGWA's representative districts do not represent and have no authority to mitigate for any junior groundwater right holders who are not members of a groundwater district. *See* I.C. § 42-5224(6). This is also confirmed in IGWA's filing wherein the districts represent they are only proposing to mitigate for their members. *See Notice* at 2-3 ("These districts' proportionate shares of the 63,645 acre-feet demand shortfall predicted in the April 2023 As-Applied Order are as follows . . ."). Stated another way, the *Notice* does not indicate that the districts will mitigate for the entire predicted demand shortfall of 75,200 acre-feet.

Any delay in the schedule would inevitably delay administration of any affected junior ground water rights not covered through an approved any effectively operating mitigation plan. Every day that passes furthers the potential that unmitigated pumping will continue to injure the Coalition's senior surface water rights without adequate mitigation as the irrigation season has already commenced throughout the various administrative basins across the ESPA.

Further exacerbating potential injury this year is the deteriorating water supply evidenced by the U.S. Bureau of Reclamation's revised May 1st streamflow forecast and the recently released 2023 aquifer sentinel well index. *See* Ex. A; *see also,* Ex. A to *Dec. of David Colvin*. The reduced surface water supply forecast due to increased temperatures and lack of spring

precipitation, as well as declining groundwater levels are likely reducing hydraulically connected reach gains in the Near Blackfoot to Minidoka reach of the Snake River this year. Moreover, it is still uncertain at this time whether storage water supplies will completely fill. *See* Ex. B. Delaying administration under such worsening conditions is not warranted and is contrary to Idaho law.

The Coalition submits the Director properly found that after "considering the need of the senior water user to have timely administration versus the ground water users desire to have more time to prepare for hearing, the Director will adhere to the current schedule." *Order* at 5 (emphasis added). The Coalition requests the Director to deny the Groundwater Users' motion to re-set the hearing accordingly and confirm that the hearing is still scheduled for June 6-10, 2023 as previously ordered.

II. Coalition Consultant Conflict.

In addition to the reasons explained above, delaying the hearing until June 19th would create a conflict for one of the Coalition's primary consultants, David Colvin, who will be out of the country and unavailable from June 8-21, 2023. *See Dec. of David Colvin*. Mr. Colvin has been assisting the Coalition for several years, including through the Technical Working Group process last fall and winter. Mr. Colvin is traveling to Vietnam, which would have an extreme time difference (13 hours ahead) making remote participation problematic. *See id.* Mr. Colvin has made travel arraignments and is planning on attending the hearing June 6-7. *See id.* Whereas moving the hearing would conflict with this schedule which has been set for weeks, the Coalition opposes the Groundwater Users' *Motion* on this basis as well.

CONCLUSION

In conclusion, the Coalition submits the Director properly exercised his discretion in denying the Groundwater Users' motion for continuance the first two times. The administrative hearing requested by the Groundwater Users and the Coalition was set over four weeks ago on April 21st and is set to begin two weeks from today. Since the parties have already been preparing for the current schedule, including deadlines set for May 30th and the June 6-10 hearing, there is no new reason to delay that schedule, particularly when the Groundwater Users are seeking that delay to accommodate their lawsuits against the State.

Time is still of the essence for conjunctive administration this irrigation season and given present aquifer levels and likely decreased reach gains this summer, any delay in the process stands to further harm the Coalition's senior surface water rights. The Coalition therefore submits the Groundwater Users' motion to re-set the hearing should be denied.

DATED this 23rd day of May, 2023.

Exhibit B

WATER REPORT – May 16, 2023

Total system natural flow continues to be sufficient to fill irrigation rights currently diverting water that are senior to the American Falls Reservoir 1921 priority storage right while continuing to accrue new storage into the 1917-priority Henrys Lake and 1913-priority Jackson Lake storage rights. It appears the American Falls storage right will reach 100% accrual near the end of this week, at which time the 1935-priority Island Park, 1936-priority Grassy Lake, 1939-priority Palisades, and perhaps the 1969-priority Ririe Reservoir space will begin accruing additional storage under their priorities.

All system natural flow is expected to be delivered to senior canal rights or stored to reservoir storage rights without spilling past Milner for at least the next few weeks. Whether the natural flow will be sufficient to fill the entire reservoir system and spill excess water past Milner probably won't be known for certain until mid-June.

BEFORE THE DEPARTMENT OF WATER RESOUCES

OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **DECLARATION OF DAVID COLVIN**

I, David Colvin, P.G., hereby declare and state as follows:

1. I am over the age of 18 and state the following based upon my own personal knowledge.

2. I am licensed as a Professional Geologist in the State of Idaho (#PGL-1453). I have a Bachelor of Science degree in Geology from Syracuse University. I have a Master of

Science degree in Environmental Science and Engineering from the Colorado School of Mines.

3. I am a Principal Hydrogeologist and the Groundwater Team Leader for LRE Water, located at 1221 Auraria Pkwy, Denver, CO 80204. I provide groundwater resource management and planning services.
4. I have been a member of the Eastern Snake Hydrologic Modeling Committee since 2011.
5. I have been retained by the Surface Water Coalition to provide Eastern Snake Plain Aquifer water resources support, including a review of the annual well measurement data that is part of the sentinel well index. Attached hereto as Exhibit A is a true and correct copy of the index graph and table that includes the most recent data gathered in the spring of 2023.
6. In November and December of 2022, I participated in Technical Work Group meetings related to Idaho Department of Water Resources (IDWR) staff considerations for methodology updates related to the *Fourth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover*.
7. I have reviewed the IDWR staff recommendations and materials related to the *Fifth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* and the *April As Applied Order*.
8. I have previously planned international travel to Vietnam from June 8 to June 21. The time difference between Boise, Idaho and Vietnam is 13 hours. I will be unable to attend

an administrative hearing concerning the above-referenced orders in person during this timeframe. I have made travel arrangements and am planning on attending the hearing on June 6 and 7, 2023.

I declare under penalty of perjury under the laws of the State of Idaho that the foregoing is true and correct.

Dated this 23rd day of May, 2023.

BEFORE THE DEPARTMENT OF WATER RESOURCES

OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **ORDER DETERMINING DEFICIENCY IN IGWA'S NOTICE OF SECURED WATER**

BACKGROUND

On April 21, 2023, the Director of the Idaho Department of Water Resources ("Department") issued his *Fifth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* ("Methodology Order"). The Methodology Order revised the nine steps used to determine material injury to members of the Surface Water Coalition ("SWC").

Step 3 of the Methodology Order states that by May 1, or within fourteen days from issuance of a final order predicting a shortfall, "whichever is later in time, junior ground water users with approved mitigation plans for delivery of water must secure, to the satisfaction of the Director, a volume of water equal to their proportionate share" of any predicted shortfall unless the forecast is revised. *Methodology Order* at 40. Step 3 further states that "[t]he secured water will not be required to be delivered to the injured members of the SWC until the Time of Need." *Id*.

On April 21, 2023, the Director also issued his *Final Order Regarding April 2023 Forecast Supply* ("As-Applied Order") in which the Director determined the predicted shortfall obligation for junior ground water users for 2023. The Director concluded that Twin Falls Canal Company ("TFCC") is the only entity with a predicted shortfall for 2023 and the shortfall value is 75,200 acre-feet. The Director ordered:

> On or before May 5, 2023, ground water users holding consumptive water rights bearing priority dates junior to December 30, 1953, within the Eastern Snake Plain Aquifer area of common ground water supply shall establish, to the satisfaction of the Director, that they can mitigate for their proportionate share of the predicted [demand shortfall] of 75,200 acre-feet in accordance with an approved mitigation plan. If a junior ground water user cannot establish, to the satisfaction of the Director, that they can mitigate for their proportionate share of the predicted [demand shortfall] of 75,200 acre-feet in accordance with an approved mitigation

plan, the Director will issue an order curtailing the junior-priority ground water user.

As-Applied Order at 6.

On May 5, 2023, the Idaho Ground Water Appropriators, Inc. ("IGWA"), acting on behalf of certain water districts[1] (collectively "Districts"), filed with the Department a *Notice of Ground Water District Mitigation* ("Notice of Mitigation"). The Notice explains that "IGWA has three approved mitigation plans." *Notice of Mitigation* at 2. IGWA states the first plan (the "2009 Storage Water Mitigation Plan") "authorizes the Districts to provide mitigation via the delivery of storage water to the SWC." *Id*. IGWA states that the second plan "authorizes the Districts to obtain mitigation credit" for various activities. *Id*. IGWA states the third plan (known as the "2015 Settlement Agreement Mitigation Plan") authorizes the Districts to "obtain mitigation protection by complying with a settlement agreement entered into between the Districts and the SWC in 2015." *Id*. IGWA recognizes that "[u]nder this plan, the Districts are required to conserve 240,000 acre-feet of water and deliver 50,000 acre-feet of storge annually to the SWC . . . ." *Id*.

Since the 2015 Settlement Agreement Mitigation Plan was approved by the Department, IGWA has only mitigated under that plan. This year, IGWA is proposing something new. Certain ground water district members are seeking to mitigate under the 2009 Storage Water Mitigation Plan and other ground water district members are seeking to mitigate under the 2015 Settlement Agreement Mitigation Plan. Instead of relying on one or two mitigation plans for all members, individual ground water districts are seeking to mitigate under different mitigation plans. IGWA states Bingham Ground Water District, Bonneville-Jefferson Ground Water District and Jefferson-Clark Ground Water District will provide mitigation under the 2009 Storage Water Mitigation Plan. *Notice* at 2. IGWA includes the following table to identify what it believes each district's proportionate share of the shortfall is:

District	Proportionate Share
Bingham GWD	13,384
Bonneville-Jefferson GWD	8,469
Jefferson-Clark GWD	6,939
Total	28,792

Id.

IGWA states "Attached hereto as Appendix A are copies of storage water leases totaling 38,714 acre-feet, submitted on behalf of the above-identified Districts." *Id*. at 3.

[1] IGWA's submitted the Notice of Mitigation on behalf of: North Snake Ground Water District, Carey Valley Ground Water District, Magic Valley Ground Water District, Aberdeen-American Falls Ground Water District, Bingham Ground Water District, Bonneville-Jefferson Ground Water District, Jefferson-Clark Ground Water District, Madison Ground Water District, and Henry's Fork Ground Water District. *Notice of Mitigation* at 1.

IGWA includes the following table to identify the districts planning to mitigate under the 2015 Settlement Agreement Mitigation Plan and each district's proportionate shares of the reduction obligation and the storage water obligation:

District	240,000 AF	50,000 AF
Aberdeen-American Falls GWD	39,395	8,705
Carey Valley GWD	821	173
Henry's Fork GWD + Madison GWD	6,299	0
Magic Valley GWD	37,931	8,000
North Snake GWD	29,765	6,410
Total	114,211	23,288

Id.

IGWA states:

> Each District's proportionate share of 240,000 is based on the Director's allocation set forth in the *Amended Final Order Regarding Compliance with Approved Mitigation Plan* issued April 24, 2023, in this matter. Each District's proportionate share of 50,000 is based on the allocation IGWA has utilized since the Settlement Agreement Plan was implemented in 2016.

Id.

FINDINGS OF FACT AND CONCLUSIONS OF LAW

1. Idaho Code § 42-602, addressing the authority of the Director over the supervision of water distribution within water districts, states:

> The director of the department of water resources shall have direction and control of the distribution of water from all natural water sources within a water district to the canals, ditches, pumps and other facilities diverting therefrom. Distribution of water within water districts created pursuant to section 42-604, Idaho Code, shall be accomplished by watermasters as provided in this chapter and supervised by the director. The director of the department of water resources shall distribute water in water districts in accordance with the prior appropriation doctrine. The provisions of chapter 6, title 42, Idaho Code, shall apply only to distribution of water within a water district.

2. The first question that must be answered is whether the ground water districts can mix the mitigation plans in the way they are proposing. IGWA's "hybridization" of mitigation plans presents serious questions about whether mixing of mitigation plans is allowable.

2009 Storage Water Mitigation Plan

3. The 2009 Storage Water Mitigation Plan was submitted to the Department on November 9, 2010. IGWA's Mitigation Plan for the Surface Water Coalition Delivery Call at 7, *In re Idaho Ground Water Appropriators, Inc.'s Mitigation Plan in Response to the Surface Water Coalition's Water Delivery Call*, No. CM-MP-2009-007 (Idaho Dep't of Water Res. Nov. 9, 2009) [hereinafter "2009 Storage Water Mitigation Plan"]. The plan was submitted by IGWA "on behalf of its Ground Water District Members and its other water user members …, for and on behalf of their respective members and those groundwater users who are non-member participants in their mitigation activities…." *2009 Storage Water Mitigation Plan* at 1.

4. The mitigation plan proposes supplying water stored in Snake River reservoirs to the SWC "that will be available on an annual basis for delivery to SWC entities as may be required by the Director's orders." *Id*. at 3. While the plan was submitted for the benefit of IGWA's members and non-member participants, the plan clearly states that IGWA will mitigate for all ground water users, not just its members and non-member participants:

> This Mitigation Plan will mitigate *any and all* material injury by guaranteeing and underwriting the senior water user's water supply. If the Director projects material injury for a senior water user, then the Ground Water Users will provide water for mitigation in accordance with this Mitigation Plan for that mitigation year. . . .This Mitigation Plan will *fully mitigate and compensate* the senior water user for material injury by making water available for direct delivery of replacement water by the Water District 1 Watermaster when necessary during the irrigation season.
> . . . .
>
> [T]he Ground Water Users will supply sufficient water to eliminate the resulting water debt ("excess use") of Twin Falls Canal Company on the books of Water District 1."

Id. at 3–4 (emphasis added).

5. The *Order Approving Mitigation Plan* issued on June 3, 2010, makes clear that any obligation determined will be set based on the amount of shortfall determined through the methodology order process: "IGWA's obligation to provide storage water shall be determined as set forth in the Methodology Order"; "IGWA's obligation for mitigation shall be determined as set forth in the Methodology Order." Order Approving Mitigation Plan at 10, *In re Idaho Ground Water Appropriators, Inc.'s Mitigation Plan in Response to the Surface Water Coalition's Water Delivery Call*, No. CM-MP-2009-007 (Idaho Dep't of Water Res. Nov. 9, 2009).

6. The *Order Approving Mitigation Plan* makes clear that if IGWA does not provide the required storage, all ground water rights are subject to curtailment: "[I]f IGWA does not provide proof of acquisition of storage water and commitment of storage water as set forth above, ground water rights pumping from the Eastern Snake Plain Aquifer will be curtailed according to the Methodology Order to provide water to the SWC." *Id.* at 11.

7. Pursuant to the plain language of the 2009 Storage Water Mitigation Plan and *Order Approving Mitigation Plan*, IGWA cannot pick and choose who gets the benefit of storage water if IGWA is not providing storage water amounts equal to the shortfall obligation. If IGWA submits to the Director adequate contracts to establish it has secured storage water and the amount secured is less than the shortfall obligation, the Director will credit the contracted volume against the overall obligation, thus reducing the overall obligation for all ground water users. This approach is consistent with the plain language of the plan and the order approving the plan.

8. Furthermore, IGWA is required to provide the Director with legally enforceable contracts, options or similar documentation to establish that it has secured the water necessary to meet the carryover obligation. *See* Order on Petition for Judicial Review at 19, *A&B Irrigation Dist. v. Tuthill*, No. CV-2008-551 (Gooding Cnty. Dist. Ct. Idaho July 24, 2009). The Director concludes that IGWA has failed to provide documentation that satisfies this standard. Before the Notice of Mitigation was filed, the two entities listed on the contracts, Bingham Groundwater District and Bonneville-Jefferson Groundwater District, hired independent counsel. See *Notice of Substitution of Counsel for Bingham Ground Water District* at 1 (May 2, 2023) ("Pursuant to this substitution of counsel, Bingham Ground Water District will forthwith be represented independently of IGWA."); *Substitution of Counsel* at 1 (Jan. 4, 2023) ("COMES NOW Skyler C. Johns, of Olsen Taggart PLLC, and hereby substitutes as counsel on behalf of Intervenor, Bonneville-Jefferson Ground Water District.") Because the Notice of Mitigation was filed by counsel for IGWA, it is unclear whether IGWA has the authority to submit the ground water districts contracts to the Director for consideration. Second, even if IGWA had authority to submit the agreements, a review of the Departments records indicate that most of the leases have not been approved by Water District 01 due to a lack of payment of fees. Without payment of the required fees, the Districts have not yet secured the required water.

9. Because IGWA failed to provide appropriate contracts, ground water users are not in compliance with the 2009 Storage Water Mitigation Plan and will not be entitled to curtailment protection under the plan. If IGWA subsequently submits documentation establishing that it has authority to submit contracts on behalf of Bingham and Bonneville-Jefferson Groundwater Districts and pays the required Water District 01 fees, but the amount of water secured is less than the shortfall obligation, then the Director will credit the contracted volume against the overall shortfall obligation, thus reducing the overall obligation for all ground water users.

2015 Settlement Agreement Mitigation Plan

10. In 2015, the SWC and certain members of IGWA[2] entered into the *Settlement Agreement Entered into June 30, 2015 Between Participating Members of the Surface Water*

[2] The following eight ground water districts and one irrigation district are signatories to the SWC-IGWA Agreement: Aberdeen-American Falls Ground Water District, Bingham Ground Water District, Bonneville-Jefferson Ground Water District, Carey Valley Ground Water District, Fremont Madison Irrigation District, Jefferson Clark Ground Water District, Madison Ground Water District, Magic Valley Ground Water District, and North Snake Ground Water District.

Coalition and Participating Members of the Idaho Ground Water Appropriators, Inc. ("SWC-IGWA Agreement").

11. In October of 2015, the SWC and IGWA entered into an *Addendum to Settlement Agreement* ("First Addendum").

12. On March 9, 2016, the SWC and IGWA submitted the *Surface Water Coalition's and IGWA's Stipulated Mitigation Plan and Request for Order* ("Request for Order") to the Director. *In re IGWA's Settlement Agreement Mitigation Plan*, No. CM-MP-2016-001 (Idaho Dept. of Water Res. Mar. 9, 2016). Attached to the Request for Order as Exhibits B, and C were the SWC-IGWA Agreement, the First Addendum. These documents were submitted as a stipulated mitigation plan in response to the SWC's delivery call. *Request for Order* at 3.

13. On May 2, 2016, the Director issued the *Final Order Approving Stipulated Mitigation Plan* ("Order Approving Mitigation Plan"), which approved the parties' mitigation plan subject to conditions. *In re IGWA's Settlement Agreement Mitigation Plan*, No. CM-MP-2016-001 (Idaho Dept. of Water Res.).

14. On December 14, 2016, the SWC and IGWA entered into the *Second Addendum to Settlement Agreement* ("Second Addendum"). *In re IGWA's Settlement Agreement Mitigation Plan*, No. CM-MP-2016-001 (Idaho Dept. of Water Res.). The *Second Addendum* amended the *SWC-IGWA Agreement* by providing additional details concerning the implementation of certain sections, most notably sections 3.a (Consumptive Use Volume Reduction); 3.e (Ground Water Level Goal and Benchmarks), 3.m (Steering Committee), and 4.a. (Adaptive Water Management). *Compare SWC-IGWA Agreement* §§ 3–4, *with Second Addendum* § 2.

15. On February 7, 2017, the SWC and IGWA submitted the *Surface Water Coalition's and IGWA's Stipulated Amended Mitigation Plan and Request for Order* ("Second Request for Order"). *In re IGWA's Settlement Agreement Mitigation Plan*, No. CM-MP-2016-001 (Idaho Dept. of Water Res.). The SWC and IGWA requested that the Director issue an order approving the Second Addendum as an amendment to the mitigation plan. *Second Request for Order* ¶ 6.

16. On May 9, 2017, the Director issued the *Final Order Approving Amendment to Stipulated Mitigation Plan* ("Order Approving Amendment to Mitigation Plan"), approving the Second Addendum as an amendment to the parties' mitigation plan subject to conditions. *Order Approving Amendment to Mitigation Plan* at 5, *In re IGWA's Settlement Agreement Mitigation Plan*, No. CM-MP-2016-001 (Idaho Dept. of Water Res.).

17. In the SWC-IGWA Agreement, the SWC and IGWA members agreed, among other things, that "[t]otal ground water diversion shall be reduced by 240,000 ac-ft annually." *SWC-IGWA Agreement* § 3.a.i. The SWC and IGWA stipulated that "[e]ach Ground Water and Irrigation District with members pumping from the ESPA shall be responsible for reducing their proportionate share of the total annual ground water reduction or in conducting an equivalent private recharge activity." *SWC-IGWA Agreement* § 3.a.ii.

18. The parties also agreed that "IGWA will provide 50,000 ac-ft of storage water though private lease(s) of water from the Upper Snake Reservoir system, delivered to the SWC 21 days after the date of allocation, for the use to the extent needed to meet irrigation requirements." *SWC-IGWA Agreement* § 3.b.i.

19. The SWC and IGWA also stipulated "that the mitigation provided by participating IGWA members under the [2015] Agreements is, provided the [2015] Agreements are implemented, sufficient to mitigate for any material injury caused by the groundwater users who belong to, and are in good standing with, a participating IGWA member." *Request for Order* ¶ 8. The SWC and IGWA agreed "[n]o ground water user participating in this [SWC-IGWA] Agreement will be subject to a delivery call by the SWC members as long as the provisions of the [SWC-IGWA] Agreement are being implemented." *SWC-IGWA Agreement* § 5.

20. In the Notice of Mitigation, the ground water districts wanting to mitigate pursuant to the 2015 Settlement Agreement Mitigation Plan have proportionately determined their individual obligations for both reduction obligations and storage obligations. While the 2015 Settlement Agreement Mitigation Plan allows for determining the proportionate share of the reduction obligation of the parties, it does not authorize the 50,000 acre-foot storage volume to be shared proportionately by the parties. To be in compliance with the plan, the entire 50,000 acre-feet must be provided.

21. Moreover, in response to a breach of the mitigation plan in 2021, the Director approved a one-year settlement agreement to remedy the 2021 breach. *Amended Final Order Regarding Compliance with Approved Mitigation Plan* at 20, *In re IGWA's Settlement Agreement Mitigation Plan*, No. CM-MP-2016-001 (Idaho Dept. of Water Res. Apr. 24, 2023). In the settlement agreement, the parties agreed that "IGWA will collectively provide to the SWC an additional 30,000 acre-feet of storage water in 2023 and an additional 15,000 acre-feet of storage water in 2024 within 10 days after the Date of Allocation of such year. Such amounts will be in addition to the long-term obligations set forth in section 3 of the Settlement Agreement and approved Mitigation Plan." *Settlement Agreement* at 2. While we are not yet to the day of allocation, the Director wants to ensure that it is clear to the parties that, as with the 50,000 acre-foot obligation, this additional amount of storage water is not subject to proportional sharing.

ORDER

Based upon and consistent with the foregoing, IT IS HEREBY ORDERED that IGWA's *Notice of Ground Water District Mitigation* is deficient and fails to demonstrate that IGWA is operating in accordance with an approved mitigation plan. If the Director issues an order of curtailment after the June 6–10, 2023 hearing, IGWA's members and non-member participants will not be entitled to curtailment protection under either the 2009 Storage Water Mitigation Plan or 2015 Settlement Agreement Mitigation Plan.

Dated this 23rd day of May 2023.

GARY SPACKMAN
Director

BEFORE THE DEPARTMENT OF WATER RESOURCES
OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **ORDER GRANTING REQUESTS FOR HEARING**

BACKGROUND

On April 21, 2023, the Director of the Idaho Department of Water Resources ("Department") issued his *Fifth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* ("Methodology Order") as well as his *Final Order Regarding April 2023 Forecast Supply* ("As-Applied Order"). The Methodology Order revises the nine steps used to determine material injury to members of the Surface Water Coalition ("SWC"). The As-Applied Order predicts a shortfall for the 2023 irrigation season, which will result in mitigation requirements or curtailment for ground water rights with priority dates junior to December 30, 1953.

Anticipating that one or more parties would request a hearing in response to one or both of the orders, the Director also issued a *Notice of Hearing, Notice of Prehearing Conference, and Order Authorizing Discovery* ("Notice of Hearing") on April 21, 2023. The Notice of Hearing set the hearing for the Methodology Order and As-Applied Order for June 6–10, 2023, at the Department's State Office, located at 322 E. Front Street, 6th Floor, Conference Rooms 602A–D, Boise, Idaho.

On April 28, 2023, the Department received the following filings:

- *The Coalition of Cities' Request for Hearing*; [1]
- *McCain Foods USA, Inc.'s Request for Hearing and Objection*;
- *The Coalition of Cities' Amended Request for Hearing*; and
- *Pocatello's Request for Hearing*.

On May 2, 2023, the Department received *IGWA's Petition for Reconsideration and Request for Hearing*.[2]

[1] For purposes of the request for hearing, the "Coalition of Cities" refers to the Idaho cities of Bliss, Burley, Carey, Declo, Dietrich, Gooding, Hazelton, Heyburn, Jerome, Paul, Richfield, Rupert, Shoshone, and Wendell.

[2] For purposes of the request for hearing, ("IGWA") refers to the following ground water districts: North Snake Ground Water District, Magic Valley Ground Water District, Carey Valley Ground Water District, Aberdeen-

On May 4, 2023, the Department received the following filings:

- *Amalgamated Sugar Company's Request for Hearing, Objection, Identification of Issues and Notice of Mitigation*;
- *City of Idaho Falls Challenge and Request for Hearing*;
- *Bonneville-Jefferson Ground Water District's Request for Hearing*; and
- *Bingham Ground Water District's Request for Hearing*.

On May 5, 2023, the Department received the *Surface Water Coalition's Request for Hearing and Statement of Issues*.

ANALYSIS AND CONCLUSIONS OF LAW

Idaho Code § 42-1701A(3) provides in relevant part:

> Unless the right to a hearing before the director . . . is otherwise provided in by statute, any person aggrieved by any action of the director, including any decision, determination, order or other action . . . who is aggrieved by the action of the director, and who has not previously been afforded an opportunity for a hearing on the matter shall be entitled to a hearing before the director to contest the action.

The parties have not previously been afforded an opportunity for hearing on the Methodology Order or the As-Applied Order and are entitled to a hearing pursuant to Idaho Code § 42-1701A(3). As described above, the Director has already set a hearing on the Methodology Order and the As-Applied Order for June 6–10, 2023. To resolve any question regarding the status of the pending requests for hearing, the Director will grant the requests and will hold the hearing as previously set in the Notice of Hearing.

ORDER

IT IS HEREBY ORDERED that the parties' requests for hearing are GRANTED. The hearing will be held as previously noticed in the *Notice of Hearing, Notice of Prehearing Conference, and Order Authorizing Discovery*: June 6–10, 2023, at the Department's State Office, located at 322 E. Front Street, 6th Floor, Conference Rooms 602A–D, Boise, Idaho.

DATED this 23rd day of May 2023.

GARY SPACKMAN
Director

American Falls Area Ground Water District, Jefferson-Clark Ground Water District, Madison Ground Water District, and Henry's Fork Ground Water District.

BEFORE THE DEPARTMENT OF WATER RESOURCES

OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **ORDER DENYING MOTION TO RE-SET HEARING**

BACKGROUND

On May 22, 2023, the Cities of Bliss, Burley, Carey, Declo, Dietrich, Gooding, Hazelton, Heyburn, Idaho Falls, Jerome, Paul, Pocatello, Richfield, Rupert, Shoshone, and Wendell (collectively the "Cities"), the Idaho Ground Water Appropriators, Inc. ("IGWA"), Bonneville-Jefferson Groundwater District ("BJGWD"), and Bingham Groundwater District ("BGWD") (collectively "Groundwater Users"), filed a *Motion to Re-Set Hearing* ("Motion to Re-Set"), wherein the Groundwater Users requested that the hearing be re-set from June 6–10 to June 19–23. *Motion to Re-Set* at 2.

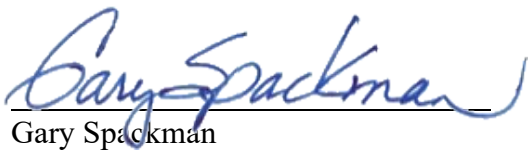
On May 23, 2023, the Surface Water Coalition ("SWC") filed *Surface Water Coalition's Opposition to Groundwater Users' Motion to Re-Set Hearing Dates* ("Objection to Motion to Re-Set Hearing").

ANALYSIS

Rule 560 of the Department's Rules of Procedure grants the presiding officer the discretion to continue a proceeding. IDAPA 37.01.01.560. Rules 710 and 711 advise that scheduling orders are interlocutory orders, and that the presiding officer has the discretion to "rescind, alter or amend any interlocutory order…". IDAPA 37.01.01.710–711.

The Groundwater Users contend that resetting the hearing for June 19–23 will allow IGWA's expert Jaxon Higgs and counsel for the Cities Candice McHugh to attend the hearing in person. *Motion to Re-Set* at 2–3. The Groundwater Users further contend that resetting the hearing will allow the Cities' expert Greg Sullivan and Ms. McHugh more time for preparation. *Id*. The Groundwater Users also point out that the Groundwater Users have filed various district court actions and associated motions and resetting the hearing date would allow "due consideration" to the various motions. *Id*. at 3.

The SWC opposes the motion, arguing the Groundwater Users "offer no new facts that would justify any further delay in this case. Instead, they repeat the same claims the Director fully considered and addressed" in his order responding to the Groundwater Users' previous



request to move the hearing dates. *Objection to Motion to Re-Set Hearing* at 2. The SWC argues that "[w]hile the Director provided for remote participation for consultants that cannot travel to Idaho or will be voluntarily out-of-state at that time, that accommodation is overlooked." *Id.* The SWC characterizes the Groundwater Users' motion to reset as nothing more than a delay tactic to buy time for their various district court lawsuits. *Objection to Motion to Re-Set Hearing* at 3–4. The SWC argues that any delay in hearing will unreasonably delay water administration and that worsening water supply conditions justify moving forward promptly. *Id*. 5–7. The SWC also asserts its expert David Colvin will be traveling to Vietnam from June 8–21, and that Mr. Colvin has already made arrangements to appear in person at the hearing on June 6–7. *Id*. at 7; *see also* Colvin Decl. ¶¶ 4, 8.

Unfortunately, it appears that given the number of parties involved, there will not be a time later in June that will be free of conflicts. The Groundwater Users do not provide any new or additional information that would justify moving the hearing date. The Director has already authorized remote participation for the Groundwater Users' experts and counsel. The Director previously stated that he would "consider moving the hearing to other dates within the first three weeks of June 2023 if the parties file[d] a stipulated motion requesting the change." *Order Denying Second Motion to Continue* at 4. Because the parties failed to stipulate to resetting the hearing, the Director concludes it is best to keep the current hearing dates of June 6–10, 2023.

ORDER

Based on the forgoing discussion, IT IS HEREBY ORDERED that the Groundwater Users' *Motion to Re-Set Hearing Dates* is DENIED.

DATED this 26th day of May 2023.

Gary Spackman
Director

Attorneys for American Falls Reservoir District #2 and Minidoka Irrigation District

BEFORE THE DEPARTMENT OF WATER RESOUCES

OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **SURFACE WATER COALITION'S WITNESS LIST**

COME NOW, A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, and TWIN FALLS CANAL COMPANY ("Surface Water Coalition" or "Coalition"), by and through counsel of record, and hereby submits the following list of witnesses for the June 6-10, 2023

hearing pursuant to the *Scheduling Order and Order Authorizing Remote Appearance at Hearing* (May 2, 2023).

Lay Witnesses

The Coalition may call any of the of the following managers for the respective irrigation districts and canal companies.

Jay Barlogi, Twin Falls Canal Company

Mr. Barlogi is expected to testify on the subjects covered in his pre-filed testimony (SWC Ex. 1) and any other matters related to the operations and water delivery by the canal company.

Justin Temple, A&B Irrigation District

Mr. Temple is expected to testify about the operations and water delivery by the irrigation district, including the delivery of surface water to certain lands within the district (SWC Ex. 2).

Kevin Lakey, American Falls Reservoir District #2

Mr. Lakey is expected to testify about the operations and water delivery by the reservoir district.

Don Terry, Burley Irrigation District

Mr. Terry is expected to testify about the operations and water delivery by the irrigation district.

Jeff Warr, Milner Irrigation District

Mr. Warr is expected to testify about the operations and water delivery by the irrigation district.

Dan Davidson, Minidoka Irrigation District

Mr. Davidson is expected to testify about the operations and water delivery by the

irrigation district.

Alan Hansten, North Side Canal Company

Mr. Hansten is expected to testify about the operations and water delivery by the canal company.

Expert Witnesses:

Dave Colvin (LRE Water)

Mr. Colvin is expected to testify about the subjects covered in the expert report he participated in (SWC Ex. 3). Mr. Colvin may also provide testimony about the Technical Working Group process related to the methodology updates that occurred during the fall/winter of 2022.

Dave Shaw (ERO Resources)

Mr. Shaw is expected to testify about the subjects covered in the expert report he participated in (SWC Ex. 4). Mr. Shaw may also provide testimony about the Technical Working Group process related to the methodology updates that occurred during the fall/winter of 2022.

Charles G. Brockway (Brockway Engineering PLLC)

Dr. Brockway is expected to testify about the subjects covered in his expert report that he participated in (SWC Ex. 4).

G. Erick Powell (Brockway Engineering PLLC)

Dr. Powell is expected to testify about the subjects covered in the expert reports that he participated in (SWC Exs. 3, 4).

The Coalition reserves the right to examine and call all individuals disclosed in other parties' disclosures of witnesses, including the Department witnesses Jennifer Sukow and Matt

Anders. The Coalition also reserves the right to call any witnesses necessary for rebuttal testimony.

DATED this 30th day of May, 2023.

The City of Idaho Falls, the City of Pocatello, and the Coalition of Cities[1] (collectively, "Cities") submit this *Joint Disclosure of Proposed Witnesses for Hearing* in compliance with the *Scheduling Order*.

[1] The Coalition of Cities includes the Cities of Bliss, Burley, Carey, Declo, Dietrich, Gooding, Hazelton, Heyburn, Jerome, Paul, Richfield, Rupert, Shoshone, and Wendell

I. IDENTIFICATION OF POSSIBLE WITNESSES AND SCOPE OF TESTIMONY

a. Greg Sullivan, P.E.

Spronk Water Engineers, Inc.
1000 Logan Street
Denver, CO 80203
303-861-9700

Mr. Sullivan may testify as an expert on matters related to crop evapotranspiration, irrigation methods and practices, water distribution systems, project efficiencies, projecting water demands, forecasting water supplies, conjunctive water management, groundwater modeling, the Eastern Snake Plain Aquifer, and hydraulic engineering. His expert report has been timely disclosed under the *Scheduling Order*.

b. Matthew Anders, P.G.

Idaho Department of Water Resources, Hydrology Section
322 E. Front Street
Boise, ID 83702

Mr. Anders may testify as a lay witness on matters related to the Department's preparation and issuance of the *Fifth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* ("Fifth Methodology Order"), and the preparation, issuance, and application of the *Final Order Regarding April 2023 Forecast Supply (Methodology Steps 1-3)* ("As-Applied Order").

c. Jennifer Sukow, P.E., P.G.

Idaho Department of Water Resources, Hydrology Section
322 E. Front Street
Boise, ID 83702

Ms. Sukow may testify as a lay witness on matters related to the Department's preparation and issuance of the *Fifth Methodology Order*, and preparation, issuance, and application of the *As-Applied Order*.

d. Mathew Weaver, P.E.

Deputy Director
Idaho Department of Water Resources
322 E. Front Street
Boise, ID 83702

Mr. Weaver may testify as a lay witness on matters related to the Department's preparation and issuance of the *Fifth Methodology Order*, and preparation, issuance, and application of the *As-Applied Order*.

e. Jay Barlogi

General Manager
Twin Falls Canal Company
357 6th Avenue W.
Twin Falls, ID 83301

Mr. Barlogi may testify as a lay witness on matters related to the Twin Falls Canal Company's ("TFCC") water supplies, water demands, irrigated acres, water distribution system, operations, the irrigation methods and practices of the shareholders thereof, and the *Fifth Methodology Order* and *As-Applied Order* as they pertain to TFCC.

f. Anthony Olenichak

Water Master
Water District 01
900 North Skyline Drive
Idaho Falls, ID 83402

Mr. Olenichak may testify as a lay witness on matters related to water supply forecasting and the distribution of water supplies to water users in Water District 01.

g. Persons identified in other parties' disclosures made pursuant to the *Scheduling Order* in this case.

h. Any witness necessary for rebuttal.

STATE OF IDAHO

DEPARTMENT OF WATER RESOURCES

IN THE MATTER OF THE DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY AND FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **IGWA's Witness and Exhibit Lists**

Idaho Ground Water Appropriators, Inc., ("IGWA"), acting for and on behalf of North Snake Ground Water District, Magic Valley Ground Water District, Carey Valley Ground Water District, American Falls-Aberdeen Ground Water District, Jefferson-Clark Ground Water District, Madison Ground Water District, and Henry's Fork Ground Water District, submits the following witness and exhibit lists.

WITNESSES

1. **Sofia Sigstedt.** Sofia Sigstedt is expected to testify as to her expert report, technical aspects of the Fifth Methodology Order and the April 2023 As-Applied Order, communications with the Department's technical working group, and other matters involving the Fifth Methodology Order and the April 2023 As-Applied Order.

2. **Jaxon Higgs.** Jaxon Higgs intended to testify as to his expert report, the proportionate mitigation obligations of IGWA's member ground water districts under the April 2023 As-Applied Order, irrigated acreage within Twin Falls Canal Company, conveyance efficiency of Twin Falls Canal Company, and other matters involving the Fifth Methodology Order and the April 2023 As-Applied Order. Mr. Higgs is not able to participate in the hearing scheduled June 6-10, 2023, due to a previously scheduled

family vacation out of the country.

3. **Mathew Weaver.** Mathew Weaver is expected to testify regarding information considered by Department personnel in developing the Fifth Methodology Order and the April 2023 As-Applied Order, the Department's application of the futile call doctrine, and other matters involving the Fifth Methodology Order and the April 2023 As-Applied Order.

4. **Tony Olenichak.** Tony Olenichak is expected to testify regarding the Department's distribution of water to members of the Surface Water Coalition and the Department's application of the futile call doctrine.

5. **Jennifer Sukow.** Jennifer Sukow is expected to testify regarding information considered and technical analyses performed by Department personnel in developing the Fifth Methodology Order and the April 2023 As-Applied Order.

6. **Matt Anders.** Matt Anders is expected to testify regarding information considered and technical analyses performed by Department personnel in developing the Fifth Methodology Order and the April 2023 As-Applied Order.

7. **Kara Ferguson.** Kara Ferguson is expected to testify regarding information considered and technical analyses performed by Department personnel in developing the Fifth Methodology Order and the April 2023 As-Applied Order.

8. **Other Department Staff.** IGWA reserves the right to call any other Department staff having information considered and technical analyses performed in connection with the development of the Fifth Methodology Order and the April 2023 As-Applied Order.

9. **Jay Barlogi.** Jay Barlogi is expected to testify regarding Twin Falls Canal Company's water delivery system, conveyance efficiencies, hydropower plants served by the Company's delivery system, Company policies, and others matters involving the Company.

10. **Lynn Carlquist.** Lynn Carlquist is expected to testify regarding the consequences for IGWA member districts and their patrons of the Fifth Methodology Order and the April 2023 As-Applied Order, and other matters involving the administration of water rights under the SWC delivery call related to the Fifth Methodology Order and the April 2023 As-Applied Order.

11. **Tim Deeg.** Tim Deeg is expected to testify regarding the consequences for IGWA member districts and their patrons due to the decisions contained within the Fifth Methodology Order and the April 2023 As-Applied Order, and other matters involving the administration of water rights under the SWC delivery call related to the Fifth Methodology Order and the April 2023 As-Applied Order.

12. **Kirk Jacobs.** Kirk Jacobs is expected to testify regarding the consequences for IGWA member districts and their patrons due to the decisions contained within the Fifth Methodology Order and the April 2023 As-Applied Order, and other matters involving the administration of water rights under the SWC delivery call related to the Fifth

Methodology Order and the April 2023 As-Applied Order.

13. Any witness identified by any other party.

14. Any witness needed to authenticate any exhibit.

15. Any witness needed for rebuttal purposes.

EXHIBITS

Attached herewith as ***Appendix A*** is IGWA's Exhibit List. In addition, IGWA reserves the right to utilize as exhibits (a) any document listed in the exhibit list of any other party to this proceeding; (b) water right records kept by the Department in its ordinary course of business; (c) any exhibit, pleading, or order filed previously with the Department in this matter; (d) transcripts of testimony proffered previously in this matter; (e) exhibits created for illustrative purposes; (f) exhibits utilized for rebuttal purposes; (g) subsequently disclosed exhibits for which the Director approves late disclosure; and (h) documents of which the Director takes official notice per IDAPA 30.01.01.602.

DATED this 30th day of May, 2023.

Attorney for Bingham Ground Water District

BEFORE THE DEPARTMENT OF WATER RESOURCES
OF THE STATE OF IDAHO

IN THE MATTER OF THE DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY AND FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **BINGHAM GROUND WATER DISTRICT'S DISCLOSURE OF PROPOSED EXHIBITS, PROPOSED WITNESSES, AND EXPERT REPORT OF DARRYLL OLSEN Ph.D.**

Bingham Ground Water District (BGWD), submits this DISCLOSURE OF PROPOSED EXHIBITS, PROPOSED WITNESSES, AND EXPERT REPORT OF DARRYLL OLSEN Ph.D. in accordance with the Director's Scheduling Order dated May 2nd, 2023.

EXHIBIT LIST

At this time, Bingham Ground Water District does not expect exhibits that have not been identified by other parties, but reserves the right to provide rebuttal exhibits as needed.

POSSIBLE WITNESS LIST AND SCOPE OF TESTIMONY

1. Darryll Olsen, Ph.D
   Pacific Northwest Project
   3030 W. Clearwater, Ste. 205-A
   Kennewick, WA
   509-783-1623

Mr. Olsen may testify regarding the economic impacts of possible curtailment within a specific 5 county area covered by groundwater districts. These impacts include micro and macro impacts as outlined by his white

paper prepared in January 2023 for Bingham Ground Water District, and his updated memo created May 30, 2023 for these proceedings. Bothe the memo and white paper are attached as his expert report at the end of this document.

2. Alan Jackson
   Bingham Ground Water District
   1725 Riverton Rd,
   Blackfoot ID, 83221
   208 684-9634

Mr. Jackson may testify regarding groundwater operations, as well as past experience with canal companies and Rubicon Water systems. He may testify regarding Bingham Ground Water District's participation in proceedings, settlements, meetings, or other relevant information.

Bingham Ground Water District, reserves the right to call rebuttal witnesses as needed.

EXPERT REPORTS

Attached to this document is a Memo and White Paper, both constituting the report from Darryll Olsen Ph.D, prepared for Bingham Ground Water District.

Dated May 30, 2023

Dylan Anderson Law, PLLC

Pacific Northwest Project
Technical Information Memorandum

DATE: May 30, 2023

TO: Mr. Gary Spackman, Director, IDWR
SE Idaho Groundwater District Boards-Managers

FROM: Darryll Olsen, Ph.D., Pacific NW Project*

SUBJECT: Supplemental Technical Memorandum for:
Policy White Paper Review for Economic Impacts Surrounding Water Right-Water Supply Restrictions to Groundwater Appropriators, Irrigation Sector Operations

---

Given the pending decisions affecting groundwater and surface-water irrigation allocations in South-East Idaho, the Pacific NW Project is providing supplemental information to the initial Policy White Paper (January 2023), further highlighting key economic impacts associated with water right-water supply curtailments/regulations affecting groundwater irrigators (see attached Table 1).

This information should better inform water managers. the IWRD Director, Gov. Brad Little, Idaho legislators, and other key parties (including the media/press) about the probable economic impacts affecting water supply curtailments to South-East Idaho groundwater pumpers with junior appropriation water rights. At best, the economic impacts should be viewed as the assets at risk to Idaho and the five-county study area.

The IDWR is taking a very cautious approach to protecting surface water right allocations;[1] so being, an equally cautious approach to recognizing, and appreciating, probable economic impacts to groundwater allocations restrictions should be employed as well. The regional/state economic impacts are very real, and they provoke the need to call for a workable course of action to deal with both groundwater and surface-water irrigation needs.

This Technical Memorandum raises the following questions:

1. <u>What is the significance of Irrigated Agriculture or the Irrigated Agriculture Industry in Idaho and the primary project area?</u>

3030 W. Clearwater, Ste. 205-A, Kennewick, WA
509-783-1623, DOlsenEcon@aol.com

---

[1] The IDWR relies on judicial/cultural review of definitions for "material injury" and "reasonable use" to formulate its initial 2023 water allocation rule. While the approach retains justification, it does not bar discretionary decisions by the IDWR Director. Current above average flow conditions could be given greater deference in determining the difference between a "material injury" versus an "empirical injury," where reduced water supply impacts cannot be physically observed on the ground.

2. What does the current water supply situation in SE Idaho suggest (per Table 2 attached)?

3. How is "material injury" to senior water rights considered versus "empirical injury?" What does this mean for the current decision-making situation?

4. What types of economic impact measures and methods are used in this Technical Memorandum and the White Paper?

5. How are irrigated acreage impacts derived? What does this mean in terms of curtailed groundwater acres relative to surface supplies, acre-ft. and acres?

6. What does the economic impact analysis indicate affecting household income, revealed as direct and secondary (regional impacts)?

7. How should near-term versus long-term economic impacts be best understood?

8. What about water resources policy? What can the director do or consider given legal and conventional water resources management rules?

9. If *empirical impacts* are highly improbable, or difficult to measure, should that factor be given consideration by the IDWR director in determining reasonable protection for senior appropriator water rights? Does the weight of the probable economic impacts further support a "do no harm" approach?

10. The White Paper speaks to "internal" and "external" factors affecting groundwater and surface-water allocation conflicts in SE Idaho. What does this mean?

*Principal Investigator:

Darryll Olsen, Ph.D., Regional Planner/Resource Economist.

- About 35 years of experience preparing/directing all types of water resources economic impact projects and policy issues (Western U.S.).
- Principal economist for Argonne National Laboratory-FERC water resources project evaluations—hydro power, NED and RED impacts.
- Extensive economic evaluation work with Utah Dept. of Water Resources, water supply delivery projects; including water right change/transfers.
- Board Representative for Columbia-Snake River Irrigators Association; lead economic, technical, legislative, and litigation projects.
- Board Director, Badger Mt. Irrigation District (Ag. Irrigation, Domestic Irrigation-Household Water Service).
- Principal Author, RCW 90.80, Water Conservancy Boards in WA State; evaluated and/or approved hundreds of water right changes/transfers.
- Contributing Author, RCW 90.90, Columbia R. Basin Water Supply Act.

Table 1. Estimated Household Income Impacts--State and Subject Area for Irrigated Agriculture, 2021$, with Junior Water Rights Curtailment, At Risk Acres in Primary Southeast Idaho Area

Economic Sector	Direct Impacts	Estimated Irrigated Ag. %	Adjusted Direct Sector Values	Secondary* Income Adjusted Multiplier**	Direct & Secondary Total Impact Area

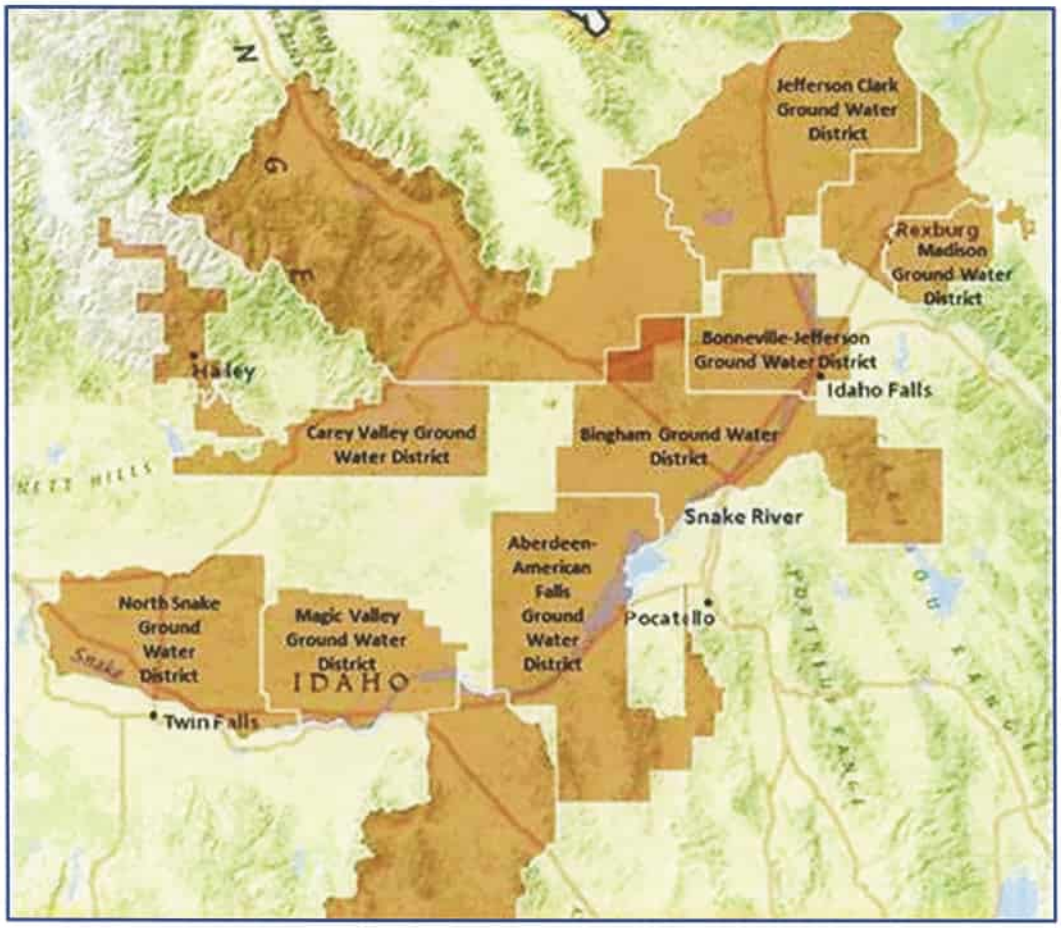
*** Estimated volume flows Near Heise at 4,107, for the April-Sept period, 107% of average flows are estimated.**

Sources: NOAA, Northwest River Forecast Center, Water Supply Forecast Listing, 5-27-2023; IDWR, Flows Forecast April 1, 2023.

Observations:



1) The estimated acre-ft./acre water demand/use for the Twin Fall Canal Company at 5.76 act-ft./acre, Total Supply, with forecast supply at 5.37 acre-ft./acre. Total irrigated acres are about 194,732.

This suggests that 3.5 acre-ft./acre could be net crop consumptive use, with 2.26 acre-ft./acre applied to carriage use/loss with some return flows; or about 40% of total dedicated supply demand.

2) For conversion to groundwater curtailment levels, it requires approximately 3 acre-ft./acre to supply 1 acre-ft. at TFCC. Conversion/impact rate is still under review for the Snake River Plain Acquifer.

Southeastern Idaho Water Resources Management Impacts

Surface-Groundwater Irrigation Demands

A Policy White Paper Review

Prepared By
Darryll Olsen, Ph.D.
Pacific Northwest Project

Prepared For:
Bingham Groundwater District
January 2023

In Summary

1. Idaho's Irrigated Agriculture Industry—Cannot be Replaced.

Idaho's Irrigated Agriculture Industry—composed of direct agricultural production, agricultural services, and food processing—sustains valuable regional, national, and international markets. It is a benchmark for agricultural producers throughout the world. State political leaders should appreciate that loss of any part of it cannot be replaced.

2. Irrigation Water Supply—the Big Picture.

Idaho's Irrigated Agriculture Industry does not exist in a geographical vacuum. Western Industry assets and the Irrigated Agriculture Industry are facing unprecedented water supply challenges. This is being exacerbated by climate change impacts, turning important Industry producers into *climate change refugees*. The Pacific Northwest retains a relatively stable water supply.

3. Surface and Groundwater Conflicts in Southeastern Idaho.

The water supply conflicts in Southeastern Idaho have evolved after decades of successful Industry growth. Conflict has revolved around changing conjunctive surface and groundwater supplies strained by increasing demands, and long-term drought. Without implementing new water management options, 150,000 acres of irrigated land will be in jeopardy.

4. Idaho's Irrigated Agriculture Industry—How Valuable Are We?

a. Idaho's Irrigated Agriculture Industry relies on about 3.4 million acres, with a farmgate value of about $6.4 billion.

b. The five-county Focus Area (Bingham, Bonneville, Clark, Jefferson, and Power counties), consists of about 843,000 acres, with a farmgate value of about $1.1 billion. "Target acres" within the Focus Area represents about 150,000 acres.

c. The statewide Industry provides about $8.8 billion in total, annual household income.

d. The Focus Area creates about $1.1 to $1.6 billion in total household income (regional-statewide impacts).

e. The irrigated land market value for 150,000 acres is about $862,000,000 to $1.7 billion, generating about $15-30 million in property tax revenues.

f. The loss of 150,000 acres would reduce household income by about $268 million.

5. Reducing Conflict—Action Items for the Idaho Legislature and Executive Office.

a. Pragmatic institutional, operational, and infrastructure measures—do exist.

b. State funding role—provide a 10-year "fixed" program for $175 million, for enhanced water management in the Focus Area.

6. Final Thoughts.

Southeastern Idaho's long-standing surface-groundwater conflict is best resolved by the state's Irrigated Agriculture Industry. Otherwise, less sympathetic interests will enter the picture.

In Summary

1. Idaho's Irrigated Agriculture Industry—Cannot be Replaced.

Idaho's Irrigated Agriculture Industry—composed of direct agricultural production, agricultural services, and food processing—sustains valuable regional, national, and international markets. It is a benchmark for agricultural producers throughout the world. State political leaders should appreciate that loss of any part of it cannot be replaced.

2. Irrigation Water Supply—the Big Picture.

Idaho's Irrigated Agriculture Industry does not exist in a geographical vacuum. Western Industry assets and the Irrigated Agriculture Industry are facing unprecedented water supply challenges. This is being exacerbated by climate change impacts, turning important Industry producers into *climate change refugees*. The Pacific Northwest retains a relatively stable water supply.

3. Surface and Groundwater Conflicts in Southeastern Idaho.

The water supply conflicts in Southeastern Idaho have evolved after decades of successful Industry growth. Conflict has revolved around changing conjunctive surface and groundwater supplies strained by increasing demands, and long-term drought. Without implementing new water management options, 150,000 acres of irrigated land will be in jeopardy.

4. Idaho's Irrigated Agriculture Industry—How Valuable Are We?

a. Idaho's Irrigated Agriculture Industry relies on about 3.4 million acres, with a farmgate value of about $6.4 billion.

b. The five-county Focus Area (Bingham, Bonneville, Clark, Jefferson, and Power counties), consists of about 843,000 acres, with a farmgate value of about $1.1 billion. "Target acres" within the Focus Area represents about 150,000 acres.

c. The statewide Industry provides about $8.8 billion in total, annual household income.

d. The Focus Area creates about $1.1 to $1.6 billion in total household income (regional-statewide impacts).

e. The irrigated land market value for 150,000 acres is about $862,000,000 to $1.7 billion, generating about $15-30 million in property tax revenues.

f. The loss of 150,000 acres would reduce household income by about $268 million.

5. Reducing Conflict—Action Items for the Idaho Legislature and Executive Office.

a. Pragmatic institutional, operational, and infrastructure measures—do exist.

b. State funding role—provide a 10-year "fixed" program for $175 million, for enhanced water management in the Focus Area.

6. Final Thoughts.

Southeastern Idaho's long-standing surface-groundwater conflict is best resolved by the state's Irrigated Agriculture Industry. Otherwise, less sympathetic interests will enter the picture.

In Summary

1. Idaho's Irrigated Agriculture Industry—Cannot be Replaced.

Idaho's Irrigated Agriculture Industry—composed of direct agricultural production, agricultural services, and food processing—sustains valuable regional, national, and international markets. It is a benchmark for agricultural producers throughout the world. State political leaders should appreciate that loss of any part of it cannot be replaced.

2. Irrigation Water Supply—the Big Picture.

Idaho's Irrigated Agriculture Industry does not exist in a geographical vacuum. Western Industry assets and the Irrigated Agriculture Industry are facing unprecedented water supply challenges. This is being exacerbated by climate change impacts, turning important Industry producers into *climate change refugees*. The Pacific Northwest retains a relatively stable water supply.

3. Surface and Groundwater Conflicts in Southeastern Idaho.

The water supply conflicts in Southeastern Idaho have evolved after decades of successful Industry growth. Conflict has revolved around changing conjunctive surface and groundwater supplies strained by increasing demands, and long-term drought. Without implementing new water management options, 150,000 acres of irrigated land will be in jeopardy.

4. Idaho's Irrigated Agriculture Industry—How Valuable Are We?

a. Idaho's Irrigated Agriculture Industry relies on about 3.4 million acres, with a farmgate value of about $6.4 billion.

b. The five-county Focus Area (Bingham, Bonneville, Clark, Jefferson, and Power counties), consists of about 843,000 acres, with a farmgate value of about $1.1 billion. "Target acres" within the Focus Area represents about 150,000 acres.

c. The statewide Industry provides about $8.8 billion in total, annual household income.

d. The Focus Area creates about $1.1 to $1.6 billion in total household income (regional-statewide impacts).

e. The irrigated land market value for 150,000 acres is about $862,000,000 to $1.7 billion, generating about $15-30 million in property tax revenues.

f. The loss of 150,000 acres would reduce household income by about $268 million.

5. Reducing Conflict—Action Items for the Idaho Legislature and Executive Office.

a. Pragmatic institutional, operational, and infrastructure measures—do exist.

b. State funding role—provide a 10-year "fixed" program for $175 million, for enhanced water management in the Focus Area.

6. Final Thoughts.

Southeastern Idaho's long-standing surface-groundwater conflict is best resolved by the state's Irrigated Agriculture Industry. Otherwise, less sympathetic interests will enter the picture.

6. Final Thoughts.

Southeastern Idaho's long-standing surface-groundwater conflict is best resolved by the state's Irrigated Agriculture Industry. Otherwise, less sympathetic interests will enter the picture.

Western water law is under siege by interests that are unsympathetic to irrigated agriculture. Across the Western U.S., cries for greater regulatory intervention are being made by frustrated or bias state regulators, environmental groups, and Tribes. Even some irrigators are turning to courts to comply with, or modify, earlier vintage water supply agreements that can no longer survive under the effects of climate change or sustained irrigation water demands. And Idaho is no stranger to calls for added fish flows from Endangered Species Act (BiOp) inriver, fish flow targets.

Some of the regulatory and statutory proposals call for a complete overhaul of state water rights, management, and regulation. Even from the University of Utah College of Law, comes a call for re-adjudicating existing water rights, to give priority to socio-ecological "needs." In Washington, the state's water management authority has proposed legislative recommendations, to restrict measures for water right change/transfers and marketing that do not address environmental justice and social equity issues (as defined by the state). This has been coined "Critical Water Theory," where all state administrative actions constrict or uncritically control water rights, particularly those in private sector hands.[7]

Idaho is unique in that junior and senior water right holders have usually sought a high level of collaboration, and they are working with a state water management agency that clearly wants to resolve problems for the Irrigated Agriculture Industry.[8] This period of grace may be short-lived, and a reasoned mindset may fade away or be disrupted by others.

[7] University of Utah, S.J. Quinney College of Law, "Climate Change and Water Law Scholarship," Utah Law Digital Commons, 2020; Water Resources Program, Ecology, "Trust, Transfers, and Water Banking Legislative Report," Draft Recommendations, August-September 2022, Olympia, WA.

[8] Some point to the Yakima River Basin, WA, Yakima Integrated Plan (YIP), as a "model" of collaboration. But most improvements to date are "ecological" in nature, and the most significant water supply mitigation for irrigators has come from direct irrigator development of access to "dead storage" in the upper basin. The overall YIP is multidecadal in structure and costs billions of dollars.

In Summary

1. Idaho's Irrigated Agriculture Industry—Cannot be Replaced.

Idaho's Irrigated Agriculture Industry—composed of direct agricultural production, agricultural services, and food processing—sustains valuable regional, national, and international markets. It is a benchmark for agricultural producers throughout the world. State political leaders should appreciate that loss of any part of it cannot be replaced.

2. Irrigation Water Supply—the Big Picture.

Idaho's Irrigated Agriculture Industry does not exist in a geographical vacuum. Western Industry assets and the Irrigated Agriculture Industry are facing unprecedented water supply challenges. This is being exacerbated by climate change impacts, turning important Industry producers into *climate change refugees*. The Pacific Northwest retains a relatively stable water supply.

3. Surface and Groundwater Conflicts in Southeastern Idaho.

The water supply conflicts in Southeastern Idaho have evolved after decades of successful Industry growth. Conflict has revolved around changing conjunctive surface and groundwater supplies strained by increasing demands, and long-term drought. Without implementing new water management options, 150,000 acres of irrigated land will be in jeopardy.

4. Idaho's Irrigated Agriculture Industry—How Valuable Are We?

a. Idaho's Irrigated Agriculture Industry relies on about 3.4 million acres, with a farmgate value of about $6.4 billion.

b. The five-county Focus Area (Bingham, Bonneville, Clark, Jefferson, and Power counties), consists of about 843,000 acres, with a farmgate value of about $1.1 billion. "Target acres" within the Focus Area represents about 150,000 acres.

c. The statewide Industry provides about $8.8 billion in total, annual household income.

d. The Focus Area creates about $1.1 to $1.6 billion in total household income (regional-statewide impacts).

e. The irrigated land market value for 150,000 acres is about $862,000,000 to $1.7 billion, generating about $15-30 million in property tax revenues.

f. The loss of 150,000 acres would reduce household income by about $268 million.

5. Reducing Conflict—Action Items for the Idaho Legislature and Executive Office.

a. Pragmatic institutional, operational, and infrastructure measures—do exist.

b. State funding role—provide a 10-year "fixed" program for $175 million, for enhanced water management in the Focus Area.

6. Final Thoughts.

Southeastern Idaho's long-standing surface-groundwater conflict is best resolved by the state's Irrigated Agriculture Industry. Otherwise, less sympathetic interests will enter the picture.

direct irrigation production data to make precise estimates, so qualitative or judgment-based assumptions must be applied, taking into account state-regional production data and conditions. The estimated irrigation-production allocations are presented in Table 1.

- An estimated percent of production value allocated to irrigated agriculture then can be applied to household income created by agricultural production, agricultural services, and food processing sectors (see Table 2). The allocations are combined to derive direct household income to the state and region (counties). These estimates are highly reliable, based on BEA 2020 income data.

- Economic sector linkages among the agricultural production, agricultural services, and food processing sectors are relatively direct and uniform; as such, the application of the production value estimates to direct household income among the sectors is considered a reasonable estimate as well. In particular, higher levels of income derived from irrigated agriculture (versus non-irrigated agriculture) are expected, and the impacts to agricultural services and food processing are usually higher as well.

- Using input-output model (IMPLAN and state sources where available) multipliers for the state and select region, value added (and income) multipliers have been calculated for the combined economic sectors of the Irrigated Agriculture Industry. The multipliers are then applied to the direct income estimates (see Table 2 and discussion therein). In previous studies the multipliers used here reflect several years of estimation and review, and the overall approach has been previously discussed with IMPLAN modelers and other conversant with I/O applications.

- The direct and secondary linkages among the economic sectors are relatively stable over time, although efficiencies in production and newly developed production products will increase the multipliers impacts. As such, it could be assumed that the multiplier levels considered here (VA multipliers and household income estimates) may be conservative. Future estimates would benefit from new IMPLAN modeling work that may marginally change the impact estimates.

Table 1. Estimated Farmgate Production Value--Total and for Irrigated Agriculture, 2018

Estimated annual household income impact for Multi-County Area: $1,550/irrigated acre, crop and pasture.
Estimated annual household income impact for Statewide Area: $1,940/irrigated acre, crop and pasture.
Estimated annual household income for impact of 150,000 acres multi-county impacts: $232,500,000.
Estimated annual household income for impact of 150,000 acres state-wide impacts: $291,000,000.

U.S. Bureau of Economic Analysis (BEA), Regional and Local Data Bases and Apps, multiple data bases for state and county NAICS sector data, for 2020 (2022). Household income data includes farm proprietor, labor income, agricultural services, and food processing. Generally cited as "BEAR Facts" data bases and apps (multiple BEA web site locations, updated annually..

NOTE: Food processing sector for Power County is a "place holder" estimate to avoid IRS disclosure issues; some corporate income is included in the state-county areas. Main access site initiated at: https://apps.bea.gov/regional/bearfacts/, and sites referenced therein (includes state GDP and household income).

NOTE: Regional-state household income multipliers based on IMPLAN and state input-output modeling for multiple areas, including WA-ID-CA and the Columbia Basin areas focusing on Production Irrigated Agriculture industry (production agriculture, agricultural services, and food processing combined sectors). Multiple analyses where considered. The modeling runs were relying on 1998-2013 data; the intersector linkages remain relatively stable over time, as such the multiplier estimates used here are deemed reasonable for the needs of this Policy White Paper. We note that the concentration of food processing for the counties is high, and this sector retains higher multiplier values, than the production irrigated agriculture sector alone. We note as well that more recent impact analyses for irrigation manufacturing and services suggest higher range multipliers.

For IMPLAN modeling purposes, the above sectors are combined (direct impact), with indirect-induced impacts calculated from the joint sector modeling (Pacific Northwest Project approach). Previously working with IMPLAN group modeling staff and regional IMPLAN modeling economists, this review considered both income and value added (VA) multiplier use, recognizing structural differences. Nevertheless, the VA multiplier is applied here in an attempt to reflect the full household income impacts associated with labor income, all forms of proprietary income, and associated land income (rent), and taxes contributed to additional statewide income. In effect, all income. The U.S. BEA Regional Input-Output Modeling System, RIM II Guidebook, defines value added income as generated from compensation, payments to government (taxes), and investment returns--essentially all income impacts.

Regional impact sources include: Pacific Northwest Project, "The Economic Importance of Western Irrigated Agriculture, 2015," White Paper Review, Prepared for the Family Farm Alliance, Kennewick WA (available at CSRIA.org and FFA web site). Statewide VA multipliers in the 2.0 to 2.5 range.

Office of Financial Management/UW, "The 2012 Washington Input-Output Study," OFM-Olympia-WA, Forecasting & Research, 2021. Used by State of Washington for estimating biennial budget impacts, multipliers for agriculture and food processing (employment multipliers at 1.5-3.3, often associated with income multipliers).

Entrix, Inc., "Economic Contribution of Agriculture Irrigated by the Columbia Basin Project," Prepared for the Columbia Basin Irrigation Dists., 2010, Entrix, Inc, Vancouver, WA. Multi-County and Statewide VA multipliers in the 1.8 to 2.4 range (some multi-state "linkage" indicated).

Columbia-Snake River Irrigators Association/IRZ Consulting, "Economic Impacts from Irrigation Development, East-Low Canal, Columbia Basin Project," Prepared for Office of Columbia River-Adams County, CSRIA, Kennewick WA 2013. (Regional and Statewide VA multipliers in the 1.5 to 2.0 range.

Congressional Research Service, "California Agricultural Production and Water Use, CRS, WA-DC, 2015. Statewide employment multipliers estimated at 2.2, usually associated with income multipliers.

Minnesota IMPLAN Group, Inc., "2004-2007 WA State IMPLAN Modeling Data Multipliers Reports," MIG, Stillwater, MN, 2007. Agriculture and food processing VA multipliers in the 1.4 to 2.4 range, not including dairy processing.

Numerous technical articles on I/O Model multipliers, such as Irrigation Association, "Economic Impact of the Irrigation Services Industry," 2021, IA. National employment multipliers in the 2.3 range (usually associated with income multipliers).

Table 3. Estimated Market Irrigated Land Values and Benchmark County Property Tax Values

County Area	Market Values for 2018-2022 Sales, $/Acre Estimated Range $	Est. Index Value	Focus Area Acres	Total Est. Value	Land Value 50% Impaired Use Value	Est. Tax Rate Per $100 Taxable Value	Est. County Tax Revenue @ 100%	Est. County Tax Revenue @ 50%
Multi-County Area	$10,500-16,500	$11,500	150,000	$1,725,000,000	$862,500,000	1.75%	$30,187,500	$15,093,750
		(weighted est.)					------	------
Bigham						2.16%	------	------
Bonneville						4.60%	------	------
Clark						1.03%	------	------
Jefferson						1.63%	------	------
Power						2.21%	------	------
TOTAL:	$10,500-16,500	$11,500	150,000	$1,725,000,000	$862,500,000	1.75%	$30,187,500	$15,093,750
		(weighted est.)						

Estimated market value range indicates $10,150-16,500 per acre. Approximately 50 market transactions reviewed for the 2018-2022 period.
Irrigated transactions reviewed as land with some infrastructure included (irrigation, farm buildings), no residential structures.
Irrigated transactions reviewed as land not in development path of existing communities and commercial development (location proximity considered).
Estimated irrigated land values above assume adequate crop water duties; index value should be considered relatively conservative estimate, given active demand for agricultural lands (for various production needs).

DEPARTMENT OF WATER RESOURCES

IN THE MATTER OF THE DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY AND FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **BONNEVILLE-JEFFERSON'S WITNESS AND EXHIBIT LIST**

The Bonneville-Jefferson Ground Water District (hereafter "Bonneville-Jefferson"), acting for and on behalf of its respective members, through counsel, submits its *Proposed Witness and Exhibit List* pursuant to the Director's S*cheduling Order and Order Authorizing Remote Appearance at Hearing*, issued on May 2, 2023.

EXPERT WITNESS

Bonneville-Jefferson has retained Bryce Contor, Senior Hydrologists at Rocky Mountain Environmental Associates, Inc., 482 Constitution Way STE 303, Idaho Falls, ID 83402, for the

purpose of offering expert testimony in the above-captioned matter at the June 6, 2023, hearing. Mr. Contor may testify as an expert regarding technical aspects of transient modeling and steady state modeling; the implementation of and changes to Enhanced Snake River Plain Aquifer (ESPAM); possible application of source water fraction methods in the methodology order; and the use of transient and steady-state modeling in applications of the Fifth Methodology Order. A complete statement of the expert opinions Mr. Contor may express at trial as well as the basis and reasons for his opinions are contained in his Expert Report attached to this document as Exhibit "A."

Data and other information Mr. Contor considered in forming his opinions as well as the exhibits he intends to use as a summary or in support of his opinions are referenced in his Expert Report, identified in the Exhibit List below, and are available at the Dropbox link provided to the parties.

Mr. Contor's qualifications as an expert witness in this matter, including a list of all publications authored by him in the preceding ten (10) years are contained in his Curriculum Vitae attached to this document as Exhibit "B."

A schedule of the compensation to be paid to Mr. Contor for his work and testimony in this matter is attached to this document as Exhibit "C."

A list of cases in which Mr. Contor has testified as an expert at trial or by deposition is contained in his Curriculum Vitae previously referred to as Exhibit B.

Bonneville-Jefferson reserves the right to amend or supplement this disclosure in the event the June 6, 2023, hearing date is continued.

LAY WITNESSES

Bonneville-Jefferson reserves the right to call or re-call any witness identified by any party in the above-caption matter. Bonneville-Jefferson identifies the following lay witnesses that it may call at trial:

Jay Barlogi
Manager of Twin Falls Canal Company
357 6th Ave W
Twin Falls, ID 83301

Bonneville-Jefferson reserves the right to examine or cross-examine Mr. Barlogi regarding any material identified by a party in the above-captioned matter.

Bonneville-Jefferson may call Mr. Barlogi to testify regarding the aspects of his job as the Manager of the Twin Falls Canal Company. As manager of one of the Surface Water Companies making the water delivery call against Bonneville-Jefferson and other ground water users, Mr. Barlogi has information relevant to the water call, generally, and the implementation of the Director's current and previous methodology orders. He also has information relevant to any demand shortfall his company has experienced. Further, he can speak to information his company provides the Idaho Department of Water Resources each year prior to the calculation of any demand shortfall in this water delivery call. Jay can specifically discuss the irrigated acreage and crop water needs for his company and the efficiency of his system in meeting water delivery demands. He may testify regarding diversions, measurement, and application of surface water that is the subject of the instant water delivery call. Mr. Barlogi has also participated extensively in the 2015 IGWA/SWC Settlement Agreement and can testify to matters pertaining to that agreement.

Bonneville-Jefferson reserves the right to amend or supplement this list in the event the June 6, 2023, hearing date is continued.

EXHIBIT LIST

Following are a list of exhibits Bonneville-Jefferson intends to present at trial:

Ex. No.	Ex. Name
500	Expert Report Regarding Selected Technical Aspects of the Fifth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover, Bryce Contor

Expert Report Regarding Selected Technical Aspects of the *Fifth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover*

May 31, 2023
Bryce A. Contor
Principal Hydrologist
Rocky Mountain Environmental Associates, Inc.

Introduction

To aid in an administrative hearing concerning the *Fifth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* (Fifth Order), Rocky Mountain Environmental Associates Inc. (RMEA) provides this expert report regarding technical topics. This is not an exhaustive report, but is confined to the following technical issues:

- Technical arguments used by the Idaho Department of Water Resources (IDWR) to justify the use of transient modeling as opposed to stead state modeling;
- Purposes of the Enhanced Snake River Plain Aquifer Model (ESPAM) and technical opinions regarding its use;
- Possible application of source water fraction methods to parse out supplemental water use by the Surface Water Coalition;
- Logical consistency in the use of transient and steady-state modeling.

In this report, all references to Finding(s) of Fact or Conclusion(s) of law are to the Fifth Order unless explicitly stated otherwise.

Technical Arguments for use of Transient Modeling

Perhaps the most influential change in the Fifth Order is the change from steady-state modeling to transient-state modeling in determining a priority date for curtailment. The Fifth Order provides the following technical rationale for the change to transient modeling:

1. Page 2, last paragraph of the "Background" section states, *"the Department now has multiple years of experience with the methodology to better understand the impact of applying steady-state modeling versus transient modeling…."*
2. Also on page 2, the Fifth Order states *"The first version of the ESPA groundwater flow model was not calibrated at a time-scale that supported in-season transient modeling. In contrast, the current version [of ESPAM] was calibrated using monthly stress periods and half-month time steps, a refinement that facilitates in-season transient modeling…"*
3. Finding of Fact #83 quotes the Merriam-Webster dictionary for a plain-language meaning of the term "steady state," then asserts that *"A steady-state ESPAM simulation can only model [effects]… resulting from continuous curtailments of an identical magnitude and location until the effects of curtailment are fully realized."* Finding of Fact #84 states: *"For the benefits of curtailment predicted by steady-state analysis to be realized by the river, the curtailment must occur continuously until steady-state is achieved."*

Each of these stated rationales is discussed in turn, followed by a general conclusion.

Multiple Years of Experience

Concerning the stated reason that "*the Department now has multiple years of experience with the methodology to better understand the impact of applying steady-state modeling versus transient modeling,"* the Snake River Plain Aquifer Model Scenario: Hydrologic Effects of Curtailment of Ground-water Pumping Using Snake Plain Aquifer Model Version 1.1 "Curtailment Scenario" (Scenario) presented to IDWR in 2006 all of the implications of steady-state modeling vs transient described in the Fifth Order, that are correct. No data or modeling advances since 2006 have qualitatively changed the results of the Scenario. In the following excerpts, quotes from the Scenario are in italics, with square brackets *[ ]* showing clarifications that are compatible with the original text and analysis. Non-italic type not set off with brackets is commentary added with this report:

> *Page3: "It is important to recognize that even after curtailment of ground-water rights, there is a residual impact to river reaches due to previous years of ground-water pumping. The magnitude and timing of this residual impact can also be evaluated using these scenario simulations.*
>
> *Page 3: "The specific objectives [of the Scenario] are to:*
> *1) Determine the magnitude of increase in spring discharges and river gains over time for each sub-reach of the Snake River.*
> *2) Determine the seasonal magnitude of the expected increases.*
> *3) Determine the predicted impacts to aquifer water levels."*
>
> *Page 3 and page 4: "Initially, ground-water pumping removes water from aquifer storage, causing a localized cone of depression. As pumping continues, the effects propagate until a hydraulically connected boundary is reached. A recharge boundary will act as a source for the water being removed via ground-water pumping. Changes in*

EXHIBIT "A"
Page No. 2 of 33

aquifer water levels will impact the amount of water being recharged or discharged from a hydraulically connected recharge or discharge boundary. For example, in a hydraulically connected river reach, the relationship between river stage and aquifer water level will determine the amount of water moving between the aquifer and the river. For a gaining river reach, a decrease in aquifer water level will result in a decrease in the rate of ground-water discharge to the river....

As time passes and the collective impacts of ground-water pumping on the eastern Snake River Plain propagate throughout the aquifer system, less of the removed water is coming out of aquifer storage and more is coming from the river, either in the form of reduced spring discharges, decreased aquifer discharges to the river, or increased losses from the river. Ultimately, however, all of the ground water pumped and consumptively used for irrigation will come from the Snake River. It is difficult to quantify the volume and timing of these impacts to the river reaches. A numerical ground-water model is the best available tool for such an estimation."

Page 5 and 6: "The numerical superposition version of the ESPA model [used in the Scenario] is very similar to the fully populated ESPA model with all recharge and discharge terms removed and with a zero initial gradient. The numerical superposition model uses the concepts of superposition as detailed in Reilly and others (1987). The fundamental basis of superposition theory is that, for a strictly linear system, a complex problem can be decomposed into more simple sub-problems. The sum of the solutions of the sub-problems will be the same as the solution to the whole, more complex problem....

Confined aquifer model representations are strictly linear; unconfined aquifer model representations are non- linear due to the fact that aquifer transmissivity changes as aquifer water levels change. In the eastern Snake River Plain aquifer, the changes in water levels are very small relative to the total saturated thickness, so these nonlinearities are considered negligible. A comparison of the confined version of the ESPA model versus the unconfined version has been done by IWRRI and is published in ESPAM Design Document DDM-019, Comparison of Unconfined and Confined Aquifer Representation. Similarly, a comparison of model results using the fully populated model versus the numerical superposition model has been done by IWRRI and will also be documented in a report. The results of these evaluations support the conclusion that the non- linearities of the ESPAM are negligible. These results have been presented to the ESHMC [Eastern Snake Hydrologic Modeling Committee]....

The results from this [superposition] simulation represent the impacts from the particular aquifer stress being evaluated in isolation of all other recharge and discharge."

Page 6: "Evaluation of the impacts of curtailment of ground-water pumping was greatly facilitated by using the numerical superposition model. The numerical superposition model is not restricted to the 22-year period of the fully populated model and the effects of curtailment can be evaluated in isolation of all other recharge and discharge, yielding an estimate of expected changes in river gains and spring discharges due to curtailment. Evaluations of the results of these scenarios using numerical superposition can be used

EXHIBIT "A"
Page No. 3 of 33

to estimate expected future impacts to river gains due to curtailment and the residual impacts to river gains from ground-water pumping after ground-water curtailment. Using superposition allows analysis of the future impacts of a specified stress (in this case, ground-water pumping) without requiring knowledge of other future conditions such as weather" (emphasis in original).

Page 7: "For the long-term curtailment assessment, the annual averages of precipitation and evapotranspiration were used. For the seasonal curtailment assessment, summer and winter (corresponding to irrigation season and non- irrigation season) averages were used."

Page 8: "Additionally, Table 1 lists the time for each reach to come within 10% of the steady state value. For example, in Table 1, curtailment of all ground water is predicted to cause a 298 cfs accrual in the Devil's Washbowl to Buhl reach. Transient simulation results indicate that it would take approximately 59 years for the recovery to reach 90% of the steady state value. Similarly, curtailment of ground water junior to January 1, 1973 is predicted to cause an 88 cfs recovery in the same reach. Ninety percent of this recovery would be realized in 51 years."

Page 9: "Table 2 summarizes the predicted reach accrual after one year of curtailment for each reach for each cutoff date." Unfortunately, the units of Table 1 are "cfs" and the units of Table 2 are "acre feet," so it would take some calculation to perceive the difference between the first-year results and the total result.

Page 10: "Figures 18 through 28 show the seasonal predictions of reach accruals for the 11 reaches of the Snake River for each of the five cutoff priority dates....

Many of the reaches... show a winter decline almost back to the river reach gain levels of the previous year. Some of the reaches, however, show a smaller decline relative to the predicted accruals. This would indicate that the curtailed areas are more distant from the reach and that the accruals are taking longer to get to the reach...." Figure 18 also shows single-year results for two of the cutoff dates.

EXHIBIT "A"
Page No. 4 of 33

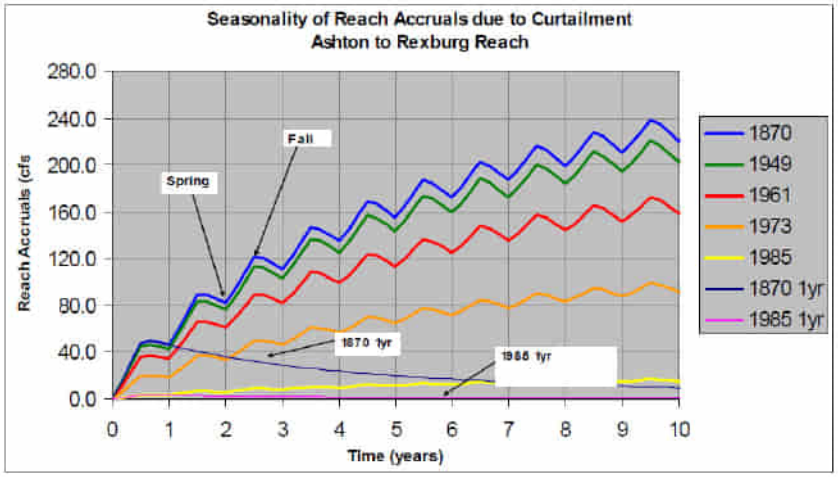

Figure 18. Seasonality of Reach Accruals due to Curtailment of Ground-Water Pumping for Ashton-Rexburg Reach (generated using ESPAM v1.1).

Figure R1: Figure 18 reproduced from Scenario.

Page 11: "Just as curtailment of ground-water pumping will cause increases in river gains, curtailment will also cause a recovery of aquifer water levels. Figures 29 through 34 show predicted changes in water levels at six locations throughout the plain due to curtailment of all ground-water pumping." Page 11 also states *"The magnitude of the rise is driven by how proximal the curtailed ground-water irrigated lands are to the river reach under evaluation."* This is incorrect and should read "how proximal... to the location where water-level changes were considered."

EXHIBIT "A"
Page No. 5 of 33

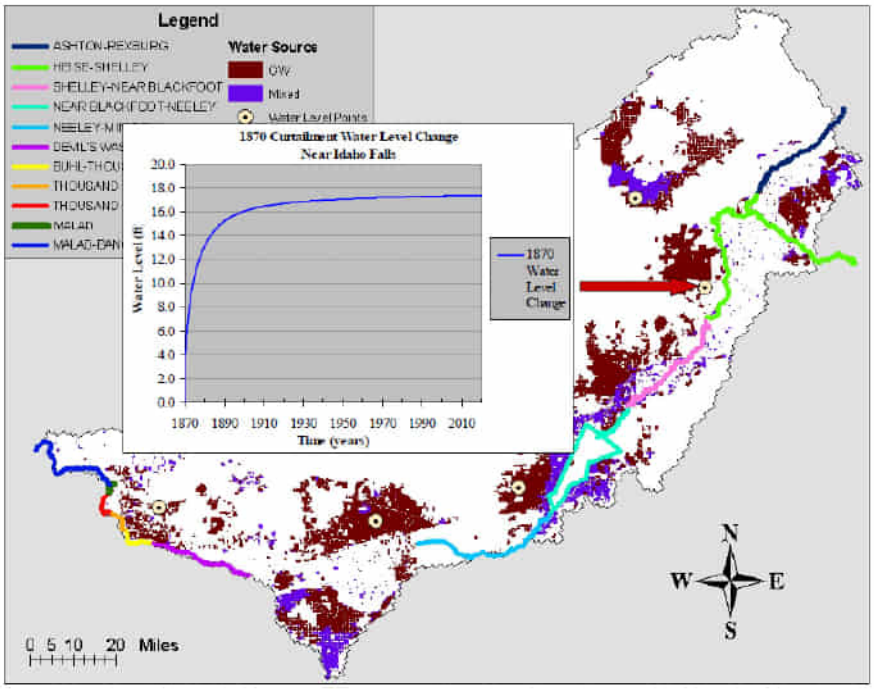

Figure 30. Predicted change in ground water level near Idaho Falls due to curtailment of ground water pumping junior to 1870 (generated using ESPAM v1.1).

Figure R2: Figure 30 reproduced from Scenario.

Page 11: "For the temporary, 1-year simulation, maximum realizable accruals are relatively small but the benefits last for several years."

These excerpts show the state of knowledge that has been available to IDWR since 2006. It could be argued that a 2006 report is so old that no IDWR personnel who were familiar with it were involved with technical input to the Fifth Order. However, a 2013 staff memo from Jennifer Sukow to Gary Spackman indicates that in 2012 Sukow repeated the curtailment scenario exercise using both ESPAM2.0 and ESPAM2.1. It is clear that in 2012 Sukow was aware of the 2006 work, and that Spackman had an opportunity to be aware of it at least as early as 2013. Both still are employed at IDWR and could have applied this knowledge at any time in approximately the last decade.

Modeling Time Scale

The second stated reason is that the *"first version of the ESPA groundwater flow model was not calibrated at a time-scale that supported in-season transient modeling. In contrast, the current version [of ESPAM] was calibrated using monthly stress periods and half-month time steps, a refinement that facilitates in-season transient modeling…."* A stress period in modeling parlance is a representation of a period of time during which model inputs (recharge and

EXHIBIT "A"
Page No. 6 of 33

discharge data, and calibration targets) are held constant. Table 1 in this report shows the date of release and stress period lengths used in the various versions of the model discussed above. The timing of events shown in Table R1 is different than intimated by the statement in the Fifth Order.

Table R1. Model Versions, Report Dates, and Stress-Period Lengths

Model	Report Year	Stress-Period Length
SRPAM	1999	15.2 days
ESPAM1.0	(no report)	6 months
ESPAM1.1	2006	6 months
ESPAM2.0	(no report)	1 month
ESPAM2.1	2013	1 month
ESPAM2.2	2021	1 month

In addition to the fact that ESPAM modeling with one-month stress periods precedes the 2016 Fourth Methodology order by three years, the notion that earlier versions did not facilitate *"in-season transient modeling"* should be considered in light of the following:

- The 1999 SRPAM stress period was shorter even than the ESPAM2.2 stress period.
- The 2005 – 2006 ESPAM1.0 and ESPAM1.1 stress periods were approximately the length of an irrigation season and were assigned to winter and summer months in a fashion that facilitates evaluation of effects upon surface-water irrigation supplies.
- As illustrated by the Scenario, the ESPAM1.0 and ESPAM1.1 models not only were explicitly designed to represent seasonal effects of activities, they were used for that purpose at least as early as 2006.
- It is not necessary for the stress-period length in model application to match the stress-period length in calibration, as demonstrated by all versions of the IDWR transfer tool (ETRAN).

It is acknowledged that generally it is not considered good modeling practice to apply the model with shorter stress periods than used in calibration, though this guideline was not adhered to in the first single-cell versions of IDWR's transfer tool.

Time constraints precluded more robust analysis, and precluded analysis using ESPAM2.2. However, a limited analysis was conducted using a monthly version and a trimester version of ESPAM2.1, at three of the points shown in Figure R3. These points were not selected to be representative but rather to fully explore differences across the aquifer.

The monthly version of ESPAM2.1 is referred to as "RSP_E2_1." It is a proprietary tool developed by Rocky Mountain Environmental Associates that uses a mathematical modeling procedure called *convolution* to apply a table of input stresses to a large database (approximately two gigabytes) of transient response functions that provide responses from each of approximately 11,000 model cells to each of approximately 60 modeled spring and river reaches. The trimester version is IDWR's "ETRAN3.3" transfer tool.

EXHIBIT "A"
Page No. 7 of 33

For each point, the model was applied three times; once with ETRAN3.3, and twice with RSP_E2_1. Results are illustrated in Figure R4 through Figure R6. Only the first two years of results are shown, and only for the Near Blackfoot to Minidoka reach. All three applications represented a curtailment event that would produce 100 acre feet of reduction at the modeled point. For the results labeled "Trimester," the 100 acre feet were applied uniformly across one four-month trimester, and results modeled on a trimester stress period. For results labeled "Monthly 1," the 100 acre feet were applied uniformly across the first four months, so the application of effect was identical to the "Trimester" rendition. However, the modeling used one-month stress periods. The "Monthly 2" results also reflect 100 acre feet of relief modeled using one-month stress periods, but the relief was applied variably across six months in an effort to simulate the approximate timing of relief from an actual curtailment event.

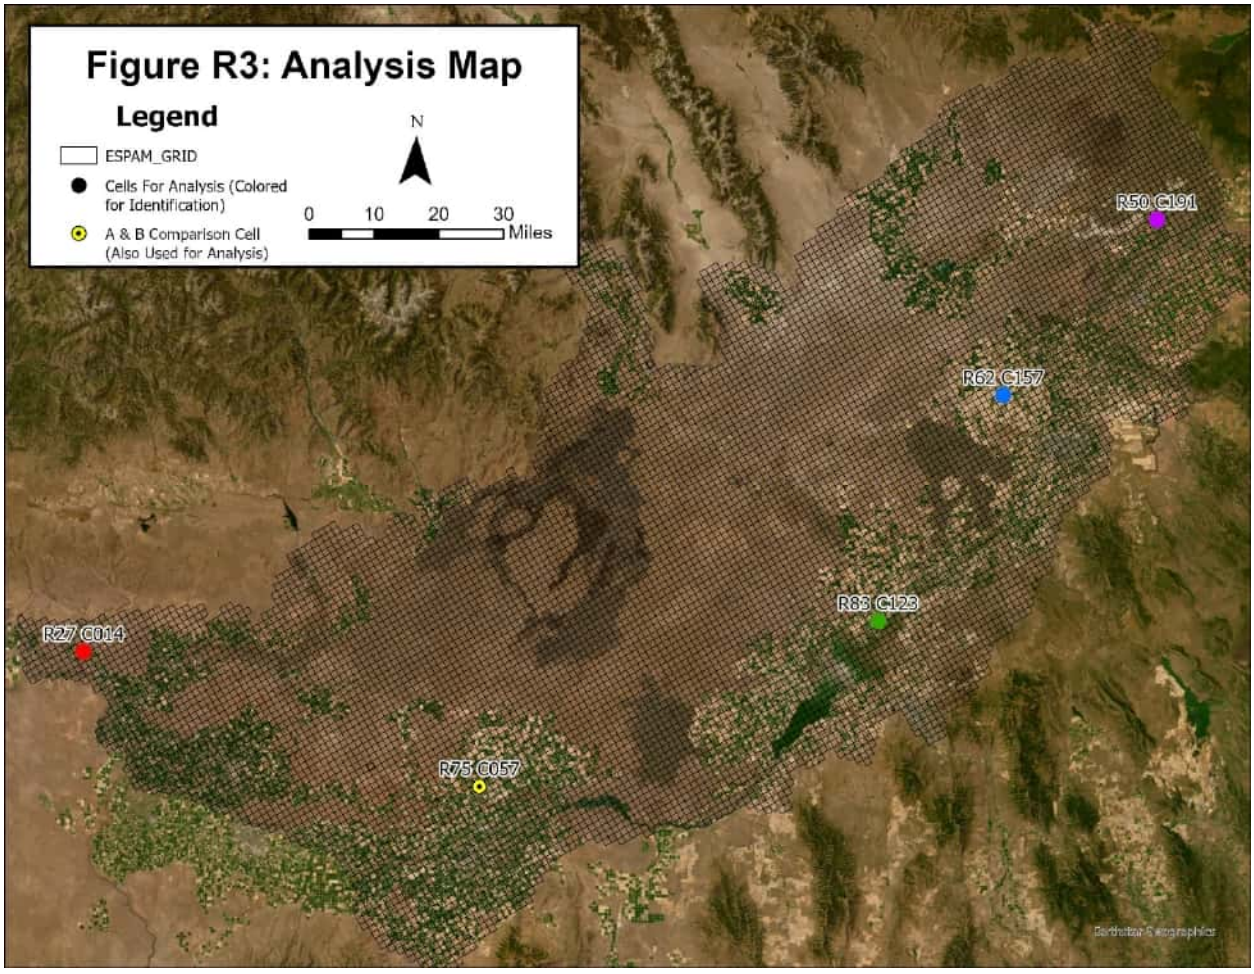

Figure R3.

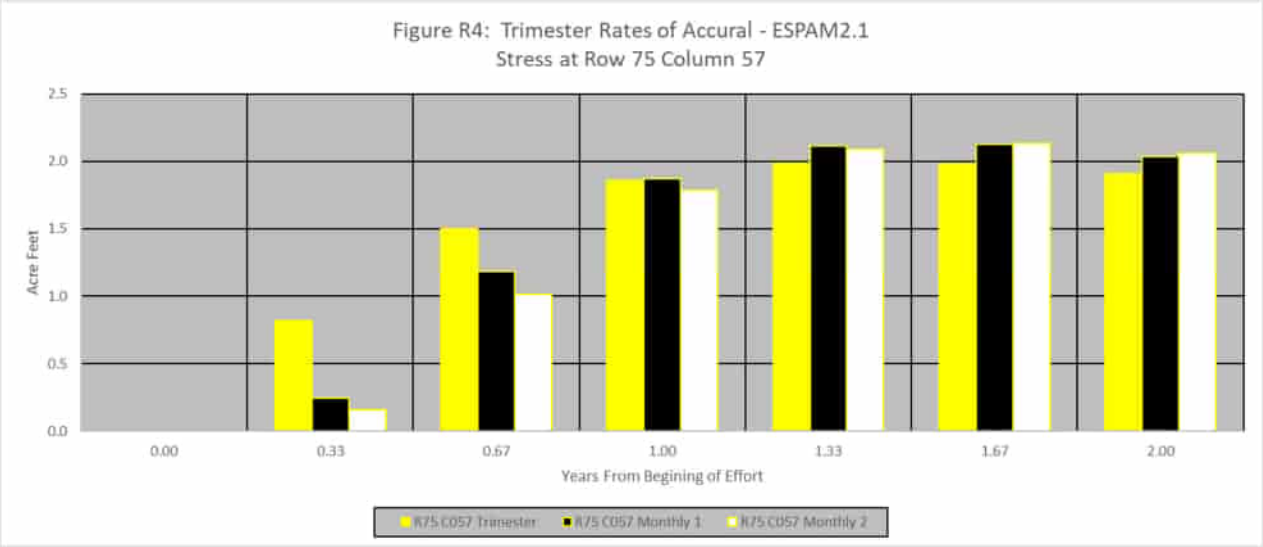

Figure R4.

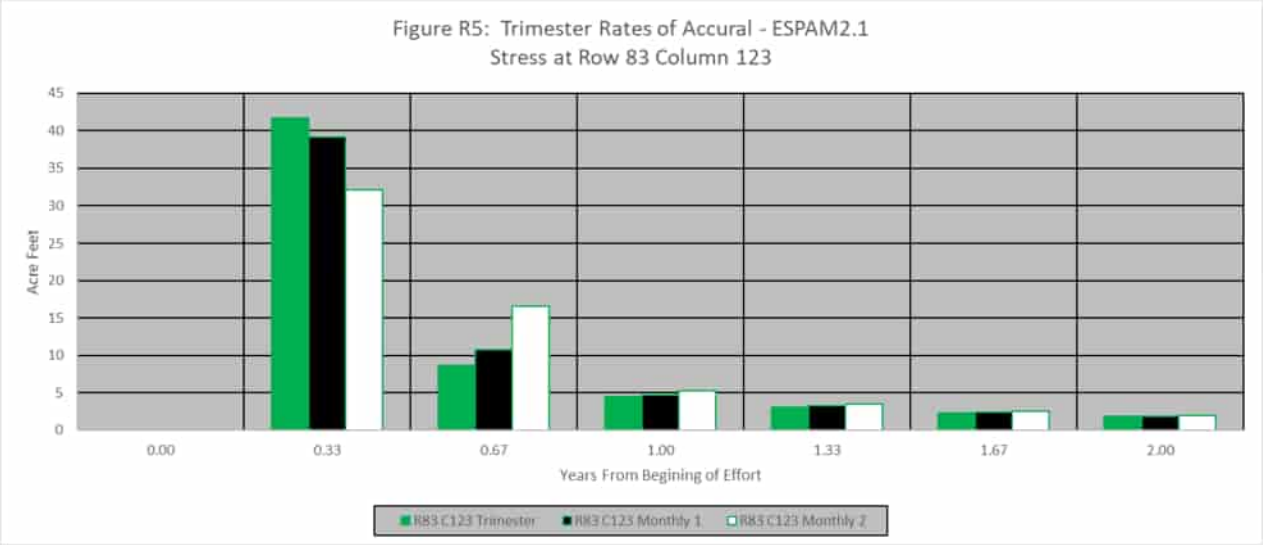

Figure R5.

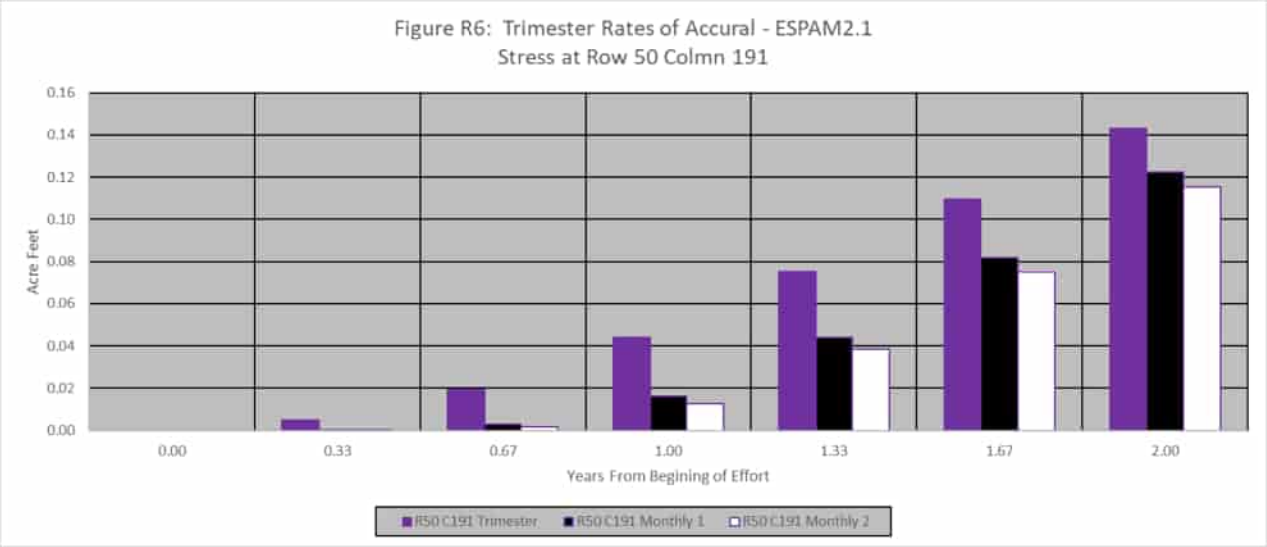

Figure R6.

Conclusions from this limited exercise are as follows:

- Within the first two years, results are qualitatively similar but not quantitatively identical.
- The differences resulting from stress-period length and temporal description of the effect of curtailment subjectively appear to be smaller than the differences between successive versions of the model, as discussed later in this report.
- The largest discrepancies, in terms of percent difference between model outputs, were observed in the point that showed the smallest overall response to the Near Blackfoot to Minidoka reach. Time constraints precluded exploration of whether this is a general result.

The results may be somewhat misleading; the model can be set to produce results as of the beginning of a stress period, or as of the end. Time constraints did not allow exploration of whether the RSP_E2_1 and ETRAN3.3 were consistent in this setting. If they were not, the discrepancies may be smaller than the figures suggest. Nevertheless, the overall conclusion is that monthly stress periods are somewhat different, and perhaps "better," than longer stress periods, but that four month stress periods and by extension probably six month stress periods can be used for evaluation on the time frame of individual irrigation seasons, as intended and practiced with ESPAM models prior to 2013.

The Nature of Steady-state Modeling

The third stated technical reason to adopt transient modeling is that *"A steady-state ESPAM simulation can only model [effects]… resulting from continuous curtailments of an identical magnitude and location until the effects of curtailment are fully realized."* It is true that permanent curtailment *could* be a presumption of steady-state analysis, and this could be the

EXHIBIT "A"
Page No. 10 of 33

presumption that was made in constructing the Scenario in terms of cubic feet per second, as suggested by the following quote:

> *Page 8: "The steady state analysis presumes the unlikely case that pumping has been permanently curtailed."*

If this was meant to apply generally to steady state modeling, it is incorrect, though it may be a reasonable explanation for a model run whose input and output values were contemplated in terms of flow rate (cfs). If the input and output values were contemplated in terms of acre feet (as is done in assigning a curtailment date), a more correct statement would have been that "Steady state analysis estimates only where the effects of curtailment will accrue and provides no information on the timing of curtailment or accrual." The most striking example of this fact is that steady-state modeling has been used to calculate curtailment date under all prior methodology orders, and is used in the Fifth Order to partition mitigation responsibility.

Despite the incorrect, or at best unfortunate, wording in the Scenario, its results did show that at long time periods, transient modeling very closely approximates time-agnostic steady-state modeling:

> *Page 9: "Figures 7 through 17 show the predicted reach accruals over a long period of time for each modeled reach, for each cutoff date..... Each figure also shows the steady state value for predicted accruals for each of the cutoff dates."*

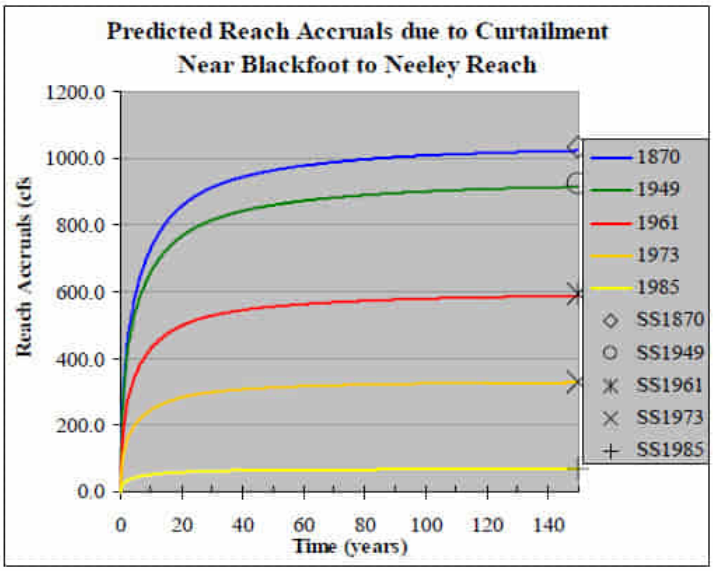

Figure 10. Predicted Reach Accruals due to Curtailment of Ground-Water Pumping for Near Blackfoot-Neeley Reach (generated using ESPAM v1.1).

Figure R7: Figure 10 reproduced from Scenario.

Intuitively, and as explained in the Scenario in 2006, if the modeling period is sufficiently long

relative to the duration of the event and the proximity of it to springs and rivers, transient results will begin to approach steady-state results and would equal them if the transient simulation could be run to infinite time.

A technically-correct Finding of Fact #83 could read:

> *Merriam-Webster's Dictionary defines steady-state as "a state or condition of a system or process … that does not change in time." Steady state, Merriam-Webster.com, https://www.merriam-webster.com/dictionary/steady-state (April 19, 2023). A steady-state ESPAM simulation based on input values of acre feet of curtailment can only ~~model increases in aquifer discharge~~ indicate total acre feet of accrual to modeled reaches of the Snake River and tributary springs resulting ~~from continuous curtailments of an identical magnitude and location until the impacts~~ after the effects of curtailment ~~are~~ have fully been realized. For example, a steady-state analysis of the curtailment of 1,000 acre feet would indicate where the 1,000 acre feet of accrual eventually would be expressed, but would not describe the timing of arrival of accruals. ~~acres, assumes that irrigation of the same 1,000 acres is curtailed every year at the same rate of consumptive use, until the impacts of that curtailment reach a steady state, or no longer change from year to year~~.*

A technically-correct Finding of Fact #84 could read in part:

> *Steady-state analysis does not calculate the time to reach steady-state conditions nor describe the seasonal timing of the impacts, but only estimates the spatial distribution of accruals. To estimate the timing of accruals, transient modeling must be employed. ~~For the benefits of curtailment predicted by steady-state analysis to be realized by the river, the curtailment must occur continuously until steady-state is achieved. The assumption of continuous curtailment does not reflect reality in the SWC Delivery Call~~* [SWC refers to the Surface Water Coalition].

Conclusions Regarding Technical Justification for Adopting Transient Modeling

It is my professional opinion that the Fifth Order's technical arguments for adoption of transient modeling are not factually sound:

- IDWR has had access to the current understanding of the general implications of transient vs. steady-state modeling since at least 1999, and access to the specific implications of a curtailment context since 2006;
- The 1999 SRPAM model had stress periods even shorter than the current model;
- Though its stress periods were longer than the current model, the 2006 ESPAM1.1 model was designed and deployed to represent effects on an irrigation-season time scale;
- The 2013 ESPAM2.1 model had identical stress periods to the current ESPAM2.2 model.
- The transient version of the model can be used to represent temporary curtailment of water rights.

EXHIBIT "A"
Page No. 12 of 33

Since the technical rational presented is not factually correct, it is my professional opinion that the Fifth Order does not reveal the true rationale for the change from steady-state to transient. I therefore am unable to comment on the technical merit of the actual rationale.

Purposes and Use of ESPAM Modeling

The 1999 SRPAM model was stated "*to be a planning and management tool for use by both agencies [IDWR and US Bureau of Reclamation].* The subsequent ESPAM model reports have indicated the stated purpose of informing *"conjunctive management,"* a misnomer that has been used for decades in Idaho for conjunctive *administration* of groundwater and surface-water rights. Curtailment is a conjunctive-administration activity, and in all likelihood, curtailment calculations always have been a consideration of IDWR. However, the ESPAM reports have cautioned that model use should correspond to its regional nature; for instance, from the ESPAM2.2 report: "*The [model] is a regional groundwater model. For this reason, the model is best used for broad-scale predictions. The user should avoid the temptation to model localized phenomena…. This limitation exists in part because the input data used to compute the agricultural impacts are still coarse."*

In 2007 and again in 2012, many members of the Eastern Snake Plain Hydrologic Modeling Committee (ESHMC) responded to invitations to participate in drafting of "white papers," which in reality were compilations of individual statements on model use. Opinions ranged widely, from: "*It is our professional opinion that the current model has no technical credibility as a tool for water rights administration*" (2007 White Paper) to: *"[I]nformation from the model can be used to estimate the effects of curtailment of ground water pumping on aggregated river reaches."* (2007 White Paper).

An especially insightful comment elaborates on the caution regarding coarse data: *"The effects of temporal imprecision are analogous to the effects of spatial imprecision, but are compounded with concerns about the difficulty the calibrators have had in matching seasonal amplitude in some target springs. These suggest to us that while the model <u>can</u> be used to estimate effects on a monthly basis, it <u>should not</u> be used to make administrative decisions that hinge on monthly distribution of effects"* (2012 White Paper contribution from Eastern Idaho Water Rights Coalition, emphasis in original).

Implicit in using any tool for any purpose is a determination that the tool satisfies the minimum criteria for its use. Establishing criteria is a policy question, and whether criteria are met is a technical question. The Fifth Order does not describe the policy criterion for the model's ability to match month-to-month variation, nor the rationale for the criterion. However, a metric is available; the ESPAM2.2 report provides an R^2 score for each model reach, shown in the bottom right panel of the corresponding figure of calibration results. The R^2 statistic can be described as a score of the fraction of variability in a data set that are described by an algorithm and its input data. Figure 119 shows an R^2 value of 0.4232 (i.e. the model and its input data can explain approximately 42% of monthly variability) for the Near Blackfoot to Neeley reach, and Figure

EXHIBIT "A"
Page No. 13 of 33

120 shows an R^2 value of 0.0079 (under 1%) for the Neeley to Minidoka reach. The bottom center panel provides an indication of when in the year discrepancies generally occur; these are the months when the blue and orange lines are most disparate. In both cases, the average results are worst during the irrigation season.

It is my professional opinion that unless the criterion for the ability to match monthly values is very low, ESPAM2.2 likely should not be considered appropriate for estimating month-by-month effects for the combined Near Blackfoot to Minidoka model reach when substantial consequences depend on decisions made on its basis.

Technical work that could inform the policy decision of establishing a criterion would explore the ratio of the potential relief of curtailment to the known cost. Additional technical defensibility could be gained by holistically considering all the hydrologic implications of the fundamental differences in spatial and temporal responses between groundwater systems and surface-water systems, as discussed later in this report.

It is my professional opinion that the use of ESPAM modeling is technically defensible when ratios of relief to cost are considered in light of modeling precision and imprecision, and when policy adjusts for spatial and temporal responses. This is true for both steady-state and transient modeling analysis.

Supplemental Water Use by SWC

Finding of Fact #23 states: *"There are lands within the service areas of SWC entities that are irrigated with supplemental groundwater. Exhibit 3007. Supplemental groundwater is a factor the Director can consider in the context of a delivery call…. At this time, the information submitted or available to the Department is insufficient to determine the extent of supplemental irrigation on lands within the service areas of SWC entities."*

My professional opinion is that because this statement is not factually correct, the true rational for this decision has not been disclosed. Therefore, I cannot respond to the technical content of the actual rationale. The basis for this opinion is:

- Since the initial development of ESPAM1.0 in the early 2000s, the extent and effect of supplemental groundwater irrigation has been calculated for the parts of the SWC Service Areas that are within the ESPAM model boundary.
- The data and methods that have been used in the ESPAM model are readily available and applicable to the parts of the SWC Service Areas that are outside the ESPAM model boundary.
- As a result of measurement orders, the measurement and report of well discharge data, and the availability of these data in IDWR's Water Measurement Information System (WMIS) are much more robust than in the early 2000s when these calculations first were undertaken and the methods developed.

EXHIBIT "A"
Page No. 14 of 33

- IDWR has known, or could have known, since at least 2015 that these data would be important to a correct calculation of Reasonable In Season Demand. The intervening eight years would have been sufficient time to apply the existing data and methods, or to improve them, for purposes of the methodology.

Because of the existence of these methods and data, it is my professional opinion that a defensible adjustment for supplemental groundwater use within the SWC Service Areas is reasonably within reach, on a technical basis. The existence of these methods and data is documented in accompanying documents:

- Cosgrove, D.M., B.A. Contor and G.S. Johnson. 2006 Enhanced Snake Plain Aquifer Model Final Report, pages 50 – 54.
- Contor, Bryce A. and Paul L. Pelot. April, 2008. Draft 2. Determination of Source of Irrigation Water for Calibration of Eastern Snake Plain Aquifer Model Version 2.
- Idaho Department of Water Resources. 2013. Enhanced Snake Plain Aquifer Model Version 2.1 Final Report, pages 50 – 52.
- Sukow, Jennifer. 2021. Model Calibration Report Eastern Snake Plain Aquifer Model Version 2.2, pages 15 – 17.

In addition, substantially more acre feet of diversion are required to support a surface-water irrigated acre than a groundwater-irrigated acre because the curtailment requirement is multiplied by the following:

- An acre of groundwater irrigation requires fewer acre feet of gross diversion than does an acre of surface-water irrigation supplied by a long canal.
- For most groundwater-irrigated lands, more accrual from curtailment arrives at non-target reaches than arrives at the Near Blackfoot to Minidoka Reach
- The curtailment requirement again is multiplied by the fact that more accruals from curtailment occur in future years than in the year of need.

Thus, it is my professional opinion that neglecting a single acre of supplemental irrigation within the SWC Service Area results in needless curtailment of many groundwater-irrigated acres. Therefore, strictly on a technical basis, the refinement of quantifying the effect of supplemental irrigation within the Surface Water Coalition service area could provide substantial relief to a broad constituency of Idaho water users.

Logical Consistency

This section of the report addresses logical consistency in application of modeling, from a technical viewpoint. It also lays groundwork for an attempt to address a hearing officer's complaint from a number of years ago that expert reports tend to focus on what *cannot* be done, without providing a hearing officer any input on what could be done from a technical standpoint. In response to that complaint, this report concludes with a conceptual discussion of a technical

approach that is logically consistent and coherent, that could be considered as foundation for policy deliberations.

Accruals beyond the Irrigation Season

Finding of Fact #86 indicates that: *"Only 9% to 15% of the steady state response is predicted to accrue to the near Blackfoot to Minidoka reach between May 1 and September 30 of the same year,"* indicating that the bulk of accruals from curtailment do not arrive during the time period of indicated shortfall. Time constraints prevented confirmation of the numerical values, but conceptually this matches my understanding. However, the actual response time is independent of modeling and is governed by the physical properties of the aquifer/river system. While 9% to 15% probably is a reasonable estimate, whatever the true value is, it applies identically to any curtailment regardless of whether it was calculated using steady-state or transient modeling. The only difference is that the transient modeling produces an estimate of the delay in accrual.

The delay in accrual depends on the spatial relationship of the well curtailed and the reach for which accruals are desired. The spatial distribution of the delayed response from curtailment is illustrated using evaluation of the sample points illustrated in Figure R3, presented earlier. Spatial distribution is illustrated using results from the ETRAN3.4 Transfer Tool realization of the transient ESPAM2.2 model.

Time constraints precluded duplicating the five-month May 1 to September 30 period considered important in Finding of Fact #86. However, the ETRAN3.4 Transfer Tool four-month period is not too different, and allows conceptual discussion of the results shown in Figure R8 through Figure R13. Though the transfer tool assigns its summer trimester to July, August, September, and October, from my involvement in the development of the original transfer tool I know that this assignment is arbitrary and that it is valid to consider that the figures illustrate the results of a four-month curtailment beginning in May.

EXHIBIT "A"
Page No. 16 of 33

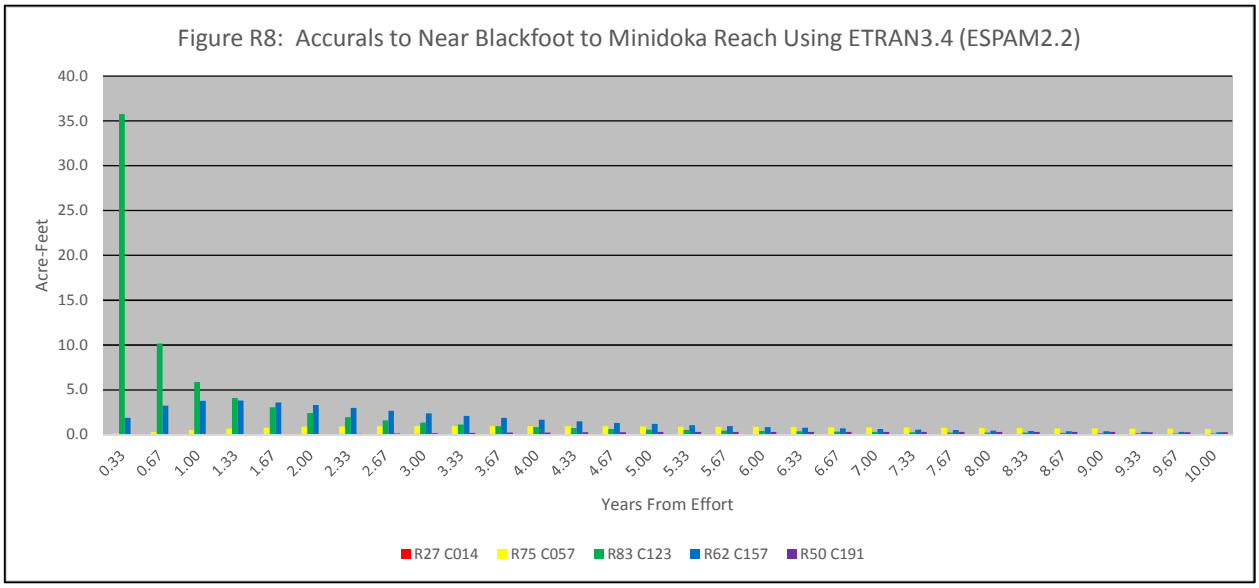

Figure R8.

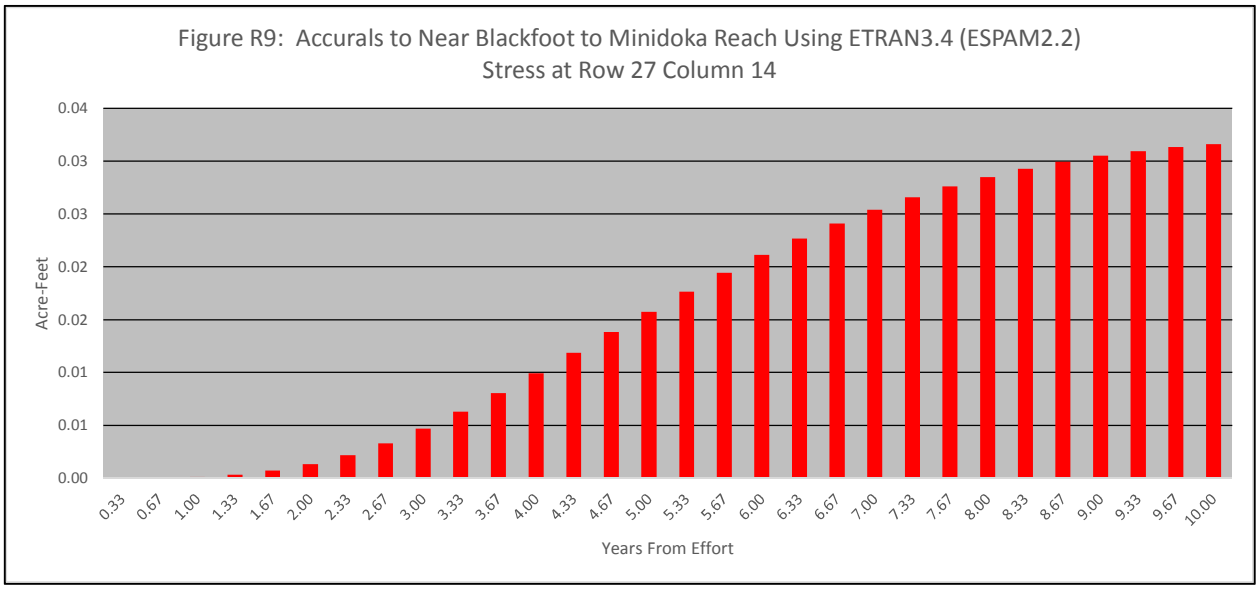

Figure R9.

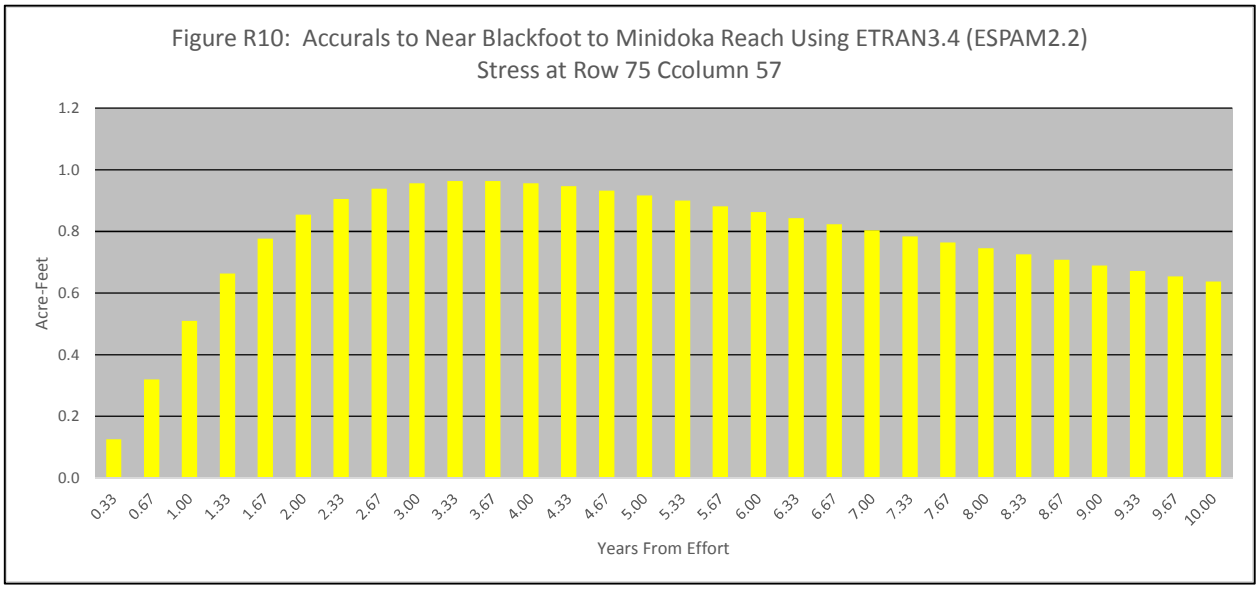

Figure R10.

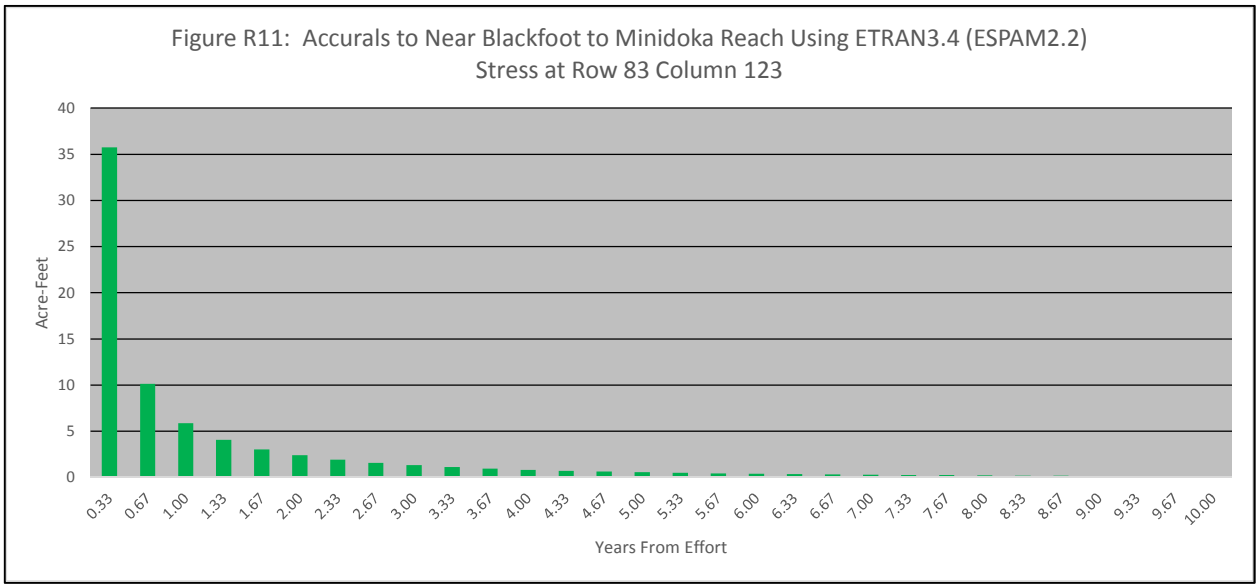

Figure R11.

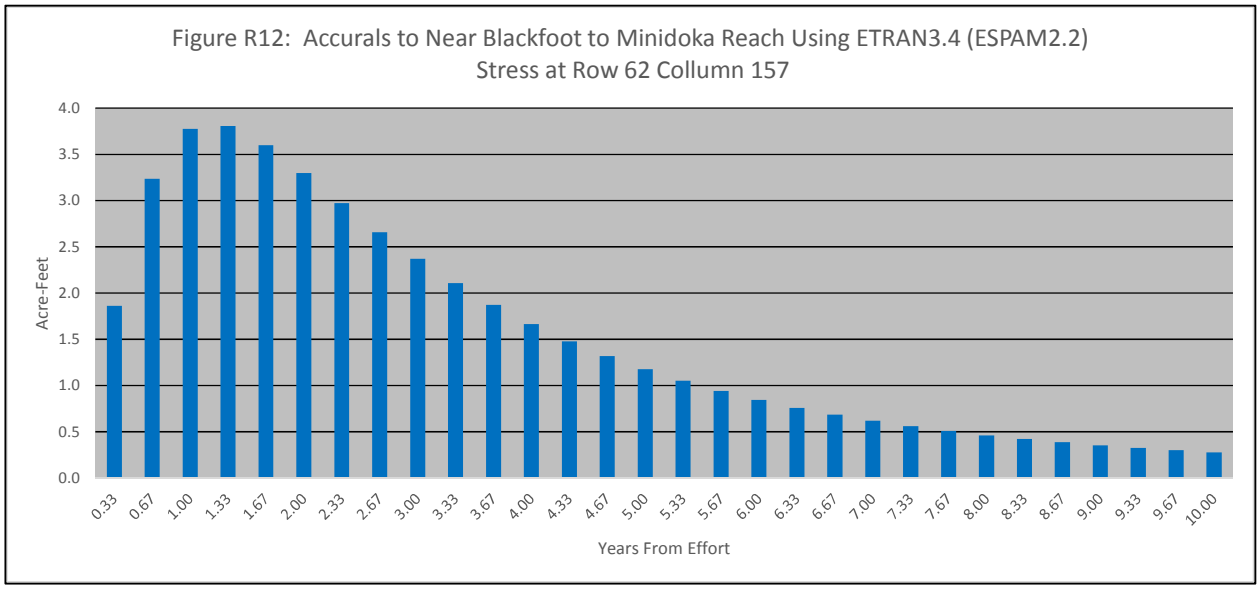

Figure R12.

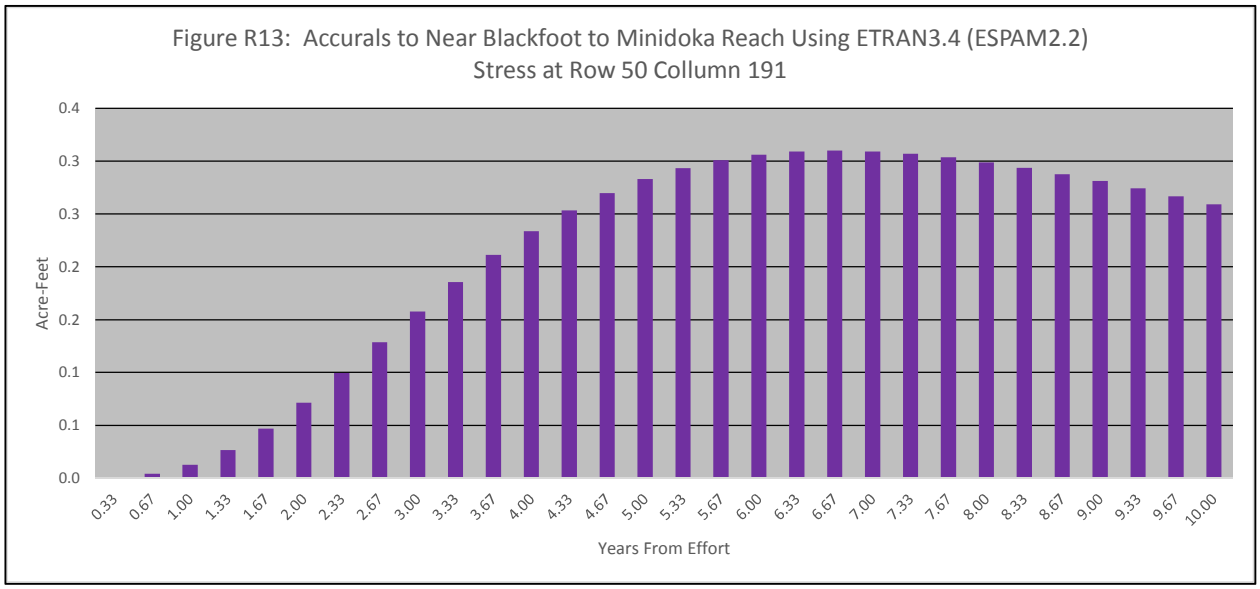

Figure R13.

Qualitatively, these figures can be summed up with the statement that: "Accruals from curtailment predominantly arrive in years later than the curtailment event, except for curtailment that occurs very near the river in the Near Blackfoot to Minidoka reach."

In deposition testimony in May, 2023, Jennifer Sukow of IDWR indicated her opinion that model-indicated future accruals to irrigation-season reach gains could be applied to offset future calculated shortfalls. This is logically consistent with the physical nature of propagation of effects, and with the modeling. However, because this carry-forward does not appear to be specified in the Fifth Order it is not clear whether such a carry-forward would be authorized. Additionally, earlier orders' Step 10, using transient modeling in relationship to reasonable

carryover, was remanded by the court (Fourth Methodology Order page 3). Time constraints preclude exploration of the arguments and rationale behind this remand, and without this understanding, it is difficult to assess whether Sukow's proposed carry-forward would survive judicial review. Regardless, even if the Fifth Order does would allow it, and even if it would survive judicial review, its omission from the Fifth Order leaves it as a mechanism that cannot be relied upon.

Sukow also indicated that the effect of curtailment on future carryover calculations would be implicit in the data relied upon. Though time constraints preclude a robust analysis, it appears that the assumption of the methodology calculations is that the data represent a single snapshot of time within a dynamic equilibrium. If this is true, then for Sukow's argument to be logically consistent, the implicit effect of prior curtailment on the well that is used in calculations would be expected to be dynamically stable, meaning that water level in said well would be relatively consistent over time. However, this is not the case following a one-time curtailment event, and the departure of the assumption from reality depends on the temporal and spatial distance of the curtailment event from the well, and also on its magnitude. Considering that modeled reach gains are a manifestation of aquifer heads in model river cells, the temporal aspects of effects on the well can be qualitatively compared to the model results summarized in Figure R8 through R13.

In Figure R11, early accruals are greater than subsequent accruals. This scenario reflects a curtailment that occurred relatively near the well, much as cell R83 C123 is relatively near the Near Blackfoot to Minidoka reach. Sukow's implicit assumption would overestimate accruals during the second year after curtailment. Overestimates, such as this one, hurt the SWC by providing less during the second year than the model would suggest. Conversely, Figures R9, R10, and R13 show scenarios for locations more distant, where subsequent accruals exceed the initial accruals. In this case, Sukow's implicit assumption would underestimate accruals during the second year after curtailment, harming potentially-curtailed water users by requiring more curtailment than is necessary to meet the need of a call. A solution would be to explicitly model and account for all future accruals, much as Sukow proposed for in-season demand calculations.

Accruals to Non-Target Reaches

The Fifth Order does not discuss the fact that curtailment would result in greater accruals to non-target reaches than it would to the Near Blackfoot to Minidoka Reach. Time constraints did not allow exploration of ESPAM2.2 results, but they would be qualitatively similar to the ESPAM1.1 results from Table 1 of the Scenario, reproduced here.

EXHIBIT "A"

Sum of Thousand Springs Reaches	**617**		**541**		**352**		**201**		**38**	
Total (cfs)	**2741**		**2453**		**1633**		**916**		**180**	
Total (acre-feet/year)	**1,984,659**		**1,775,637**		**1,182,086**		**663,362**		**130,506**	

Figure R14: Table 1 reproduced from Scenario.

Extracting the Near Blackfoot to Neeley and Neeley to Minidoka results, and comparing them to the total results, indicates the relationships show in Table R2.

Table R2: Summary of ESPAM1.1 results from Scenario

	Near Blackfoot to Neeley Accrual (cfs)	**Neeley to Minidoka Accrual (cfs)**	**Near Blackfoot to Minidoka Accrual (cfs)**	**Total Accrual (cfs)**	**Percentage of Accrual to Near Blackfoot to Minidoka**
All Pumping	1,035	158	1,193	2,741	44%
Junior to January 1, 1949	925	134	1,059	2,453	43%
Junior to January 1, 1961	593	84	677	1,633	41%
Junior to January 1, 1973	331	46	377	916	41%
Junior to January 1, 1985	69	10	79	180	44%

Depending on viewpoint, the fact that more than half the accruals from curtailment arrive at non-target reaches is either a windfall or is collateral damage. Regardless, the Fifth Order is silent on the fact of the accrual and on the technical ability to assess and report its timing and magnitude

for potential application to needs that might arise in non-target reaches, such as the small amounts of additional accrual that sometimes are needed to facilitate a Point of Diversion transfer of a groundwater right.

Consistency between Calculation of Priority Date and Partition of Responsibility

In deposition testimony in May, 2023, Jennifer Sukow indicated that the partition of responsibility for mitigation in lieu of curtailment is done on a steady-state basis on the rationale that all users bear responsibility for cumulative effects of past pumping that have been propagating toward the reach for decades. Whether this is valid rationale is a policy question beyond the scope of this report, but use of steady-state modeling is consistent with the rationale.

Use of steady-state partitioning of responsibility would be logically consistent with steady-state calculation of curtailment date, as would the use of transient partitioning be consistent with transient calculation of curtailment. The linkages are a result of the concept that mitigation in lieu of curtailment is both defined and constrained by the alternate relief that curtailment would provide.

Time constraints preclude analysis using correct spatial distributions of irrigated lands and consumptive use, but the concept can be explored hypothetically. If each of the five points illustrated in Figure R3 represented an equal number of acre feet of consumptive use from groundwater, the assignment of responsibility could be made based on model-indicated contributions to the Near Blackfoot to Minidoka reach. Using the IDWR-generated steady-state models reflected in accompanying file "E2_SSRF.csv," the steady-state assignment to Row 27 Column 14 would be 1.8% of the total obligation. The four-month contribution of curtailment at that location is represented in Figure R9. Conversely, calculating percentages to three significant figures, the four-month transient contribution of curtailment at that location using ETRAN3.4 is 0.000%. This does not mean that there is *no* benefit, but that if mitigation in lieu of curtailment were to be defined and constrained by the accruals estimated per a transient curtailment, the technically-correct mitigation would be substantially less than the steady-state partition of responsibility.

It is my professional opinion that partitioning responsibility using a different modeling framework than was used to calculate curtailment can result in some users being held responsible for more mitigation than the relief that their curtailment would have provided.

Consistency between Precision and Burden

Conclusion of Law #21 articulates understanding of the fundamental difference between groundwater hydrology and surface-water hydrology, yet the unenviable burden of IDWR is to administer the connected resources conjunctively. To frame and provide context to the technical discussion of consistency between precision and burden, the following rhetorical questions are posed for surface-water Points of Diversion:

EXHIBIT "A"
Page No. 22 of 33

- Would prior appropriation require curtailment of junior whose Point of Diversion was adjacent to the senior Point of Diversion, given that curtailment of the junior could make water immediately available to the senior?
- Would prior appropriation require curtailment of a junior whose Point of Diversion was on a stream not tributary to the senior's source?

In essence, there is a continuum comprised of the ratio between the relief afforded the senior and the cost to the junior. In a surface-water context, results tend to fall on one end of the continuum or the other. In the first hypothetical, the ratio of benefit to burden is one to one. In the second, it is zero.

Some groundwater scenarios fall on the "zero" end of the spectrum; curtailment of a well in Rathdrum likely would not provide relief to the Surface Water Coalition. A few fall close to the "full and immediate relief" end of the spectrum; for instance, modeling indicates that curtailment at the location represented by Figure R11 would produce 35% accrual to Near Blackfoot to Minidoka within four months, and 45% within eight months.

The legal meaning of the Conclusions of Law #4, #5 and #6 is beyond the scope of this report but a plain-language reading suggests that priority is not the only factor to consider. The Rathdrum example indicates that a continuum exists for groundwater, as it does for surface water. Conclusion of Law #7 indicates that IDWR requires knowledge of *"how, when, where and to what extent the diversion and use of water from one source impacts the water flows in... other sources"* (emphasis added). If knowledge of something is required, the implication is that the knowledge must be utilized in making some decision. Under that assumption, *where* the cutoff is located is a policy decision, and once the decision is made, technical work can quantify where efforts fall in relation to it.

Conclusion of Law #21 states:

> *"Rule 43 of the CM Rules mandates that when the Director evaluates a mitigation plan, the mitigation plan must ensure that water is delivered to holders of senior priority surface water rights in both the quantity and at the time and place required by the senior. In considering a proposed mitigation plan pursuant to Rule 43, the Director must evaluate:*
>
> > ***b.*** *Whether the mitigation plan will provide replacement water, at the time and place required by the senior-priority water right, sufficient to offset the depletive effect of ground water withdrawal on the water available in the surface or ground water source at such time and place as necessary to satisfy the rights of diversion from the surface or ground water source. Consideration will be given to the history and seasonal availability of water for diversion so as not to require replacement water at times when the surface right historically has not received a full supply, such as during annual low-flow periods and extended drought periods.*
> > ***c.*** *Whether the mitigation plan provides replacement water supplies or other appropriate compensation to the senior-priority water right when needed during*

> *a time of shortage even if the effect of pumping is spread over many years and will continue for years after pumping is curtailed. A mitigation plan may allow for multi-season accounting of ground water withdrawals and provide for replacement water to take advantage of variability in seasonal water supply. The mitigation plan must include contingency provisions to assure protection of the senior-priority right in the event the mitigation water source becomes unavailable* (emphasis in Fifth Order).

Time constraints, the scope of this report and the expertise of the author preclude full exploration of the implications of this excerpt, in context of the full Conjunctive Management rules. The importance here is the explicit recognition of fundamental difference between time frames of surface-water processes and the effects of groundwater activities upon surface-water processes.

Within the context of both the magnitude of expected relief and the requirement that relief be timely, an added complexity of groundwater is that the linkages are not always apparent, nor are the methods to discern them infallible. An additional policy decision that could be articulated would be a specification of if or how precision of the knowledge of the degree of hydrologic connection might inform the policy decision of where the cutoff point is on the continuum between ratios of zero and one-to-one. If that decision were to be undertaken, it could be informed by technical knowledge of the precision of the model. IDWR's contribution to the 2012 white paper discussed above could be a starting point for analysis of the precision of the model, and such analyses may already have been performed. Qualitative insight into the relative quality of the model can be gleaned from comparisons of successive models, each in their time deemed to be the best available science.

Figure R17 shows a map of points that were used for such a qualitative view of ESPAM2.0, with graphical output provided in Figure R18. Figure R18 attempts to inform both quantity and timing issues. The top three panels, with blue-colored bars, show the fraction of accruals from the three points that the models indicate would be captured by a particular reach. The bottom panels, with red-colored bars, represent the differences in modeled timing of accrual. The metric is the number of months for the model to indicate that half of the captured accruals have arrived at the reach of interest.

EXHIBIT "A"
Page No. 24 of 33

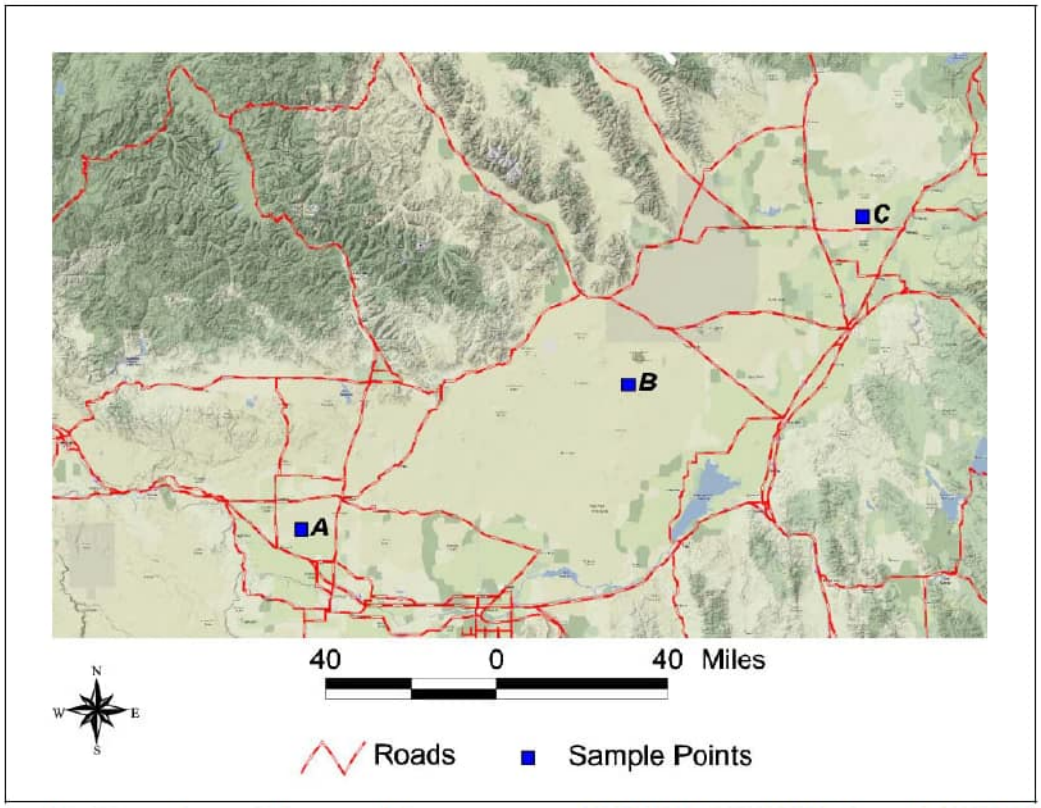

Figure 7. Sample points used to compare SRPAM, ESPAM1.1 and ESPAM2.0.

Figure R17: Figure 7 reproduced from Technical Report on ESPAM2.0 Modeling Issues

EXHIBIT "A"
Page No. 25 of 33

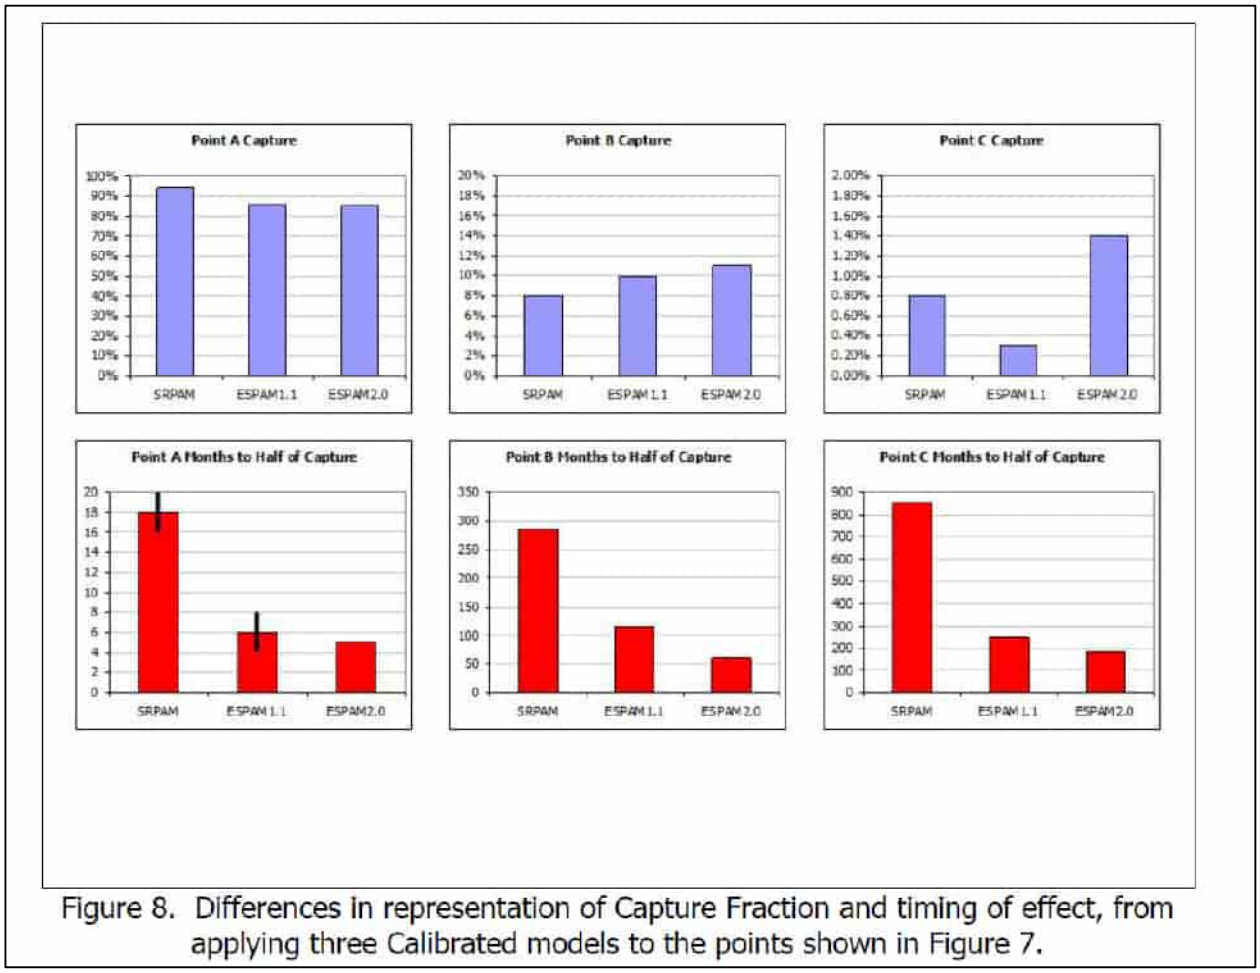

Figure 8. Differences in representation of Capture Fraction and timing of effect, from applying three Calibrated models to the points shown in Figure 7.

Figure R18: Figure 8 reproduced from Technical Report on ESPAM2.0 Modeling Issues.

Time constraints preclude comparison of ESPAM2.0 with ESPAM2.1, but Figure R19, Figure R20 and Figure R21 allow qualitative assessment of the differences between ESPAM2.1 as realized in the ETRAN3.3 Transfer Tool, and ESPAM2.2 as realized in the ETRAN3.4 transfer tool. Table R3 summarizes qualitative comparisons of the two models for these three points. The points intentionally are of disparate character and are not intended to be representative of the plain as a whole.

Table R3. Qualitative Comparison of ESPAM2.1 and ESPAM2.2 via Figures R19, R20 and R21

Point	General Location	ESPAM2.1 Years to Peak	ESPAM2.2 Years to Peak	Subjective Comparison of 10-year Sum of Accruals
R75 C57	A&B Irrigation District	1.67	3.67	ESPAM2.1 slightly higher
R83 C123	Very close to Near Blackfoot to Neeley	0.33	0.33	Very similar
R50 C191	Near Henry's Fork	5.00	6.67	Very similar

These results underscore Eastern Idaho Water Right Coalition's 2012 observation that:

> All of these uncertainties are a function of the spatial scale at which answers are sought. If the question is asked: "How much pumping at location X will propagate to river and spring reaches?" the answer can be determined with very little uncertainty, and independently of the limitations described above.
>
> If refined estimates of above-Milner vs. below-Milner effects are required, the uncertainty depends on the location of the well. For wells distant from Milner, none of these conceptual simplifications are likely to materially affect the answer. For wells near to Milner, all of these affect the results and a different set of assumptions would be expected to produce a markedly different result.
>
> Similarly, refining the question to include some understanding of the timing of effect begins to introduce additional uncertainty. The answer to "How much will propagate in time period Y" is less certain than "How much will eventually propagate," and results are sensitive to changes in conceptual simplifications.

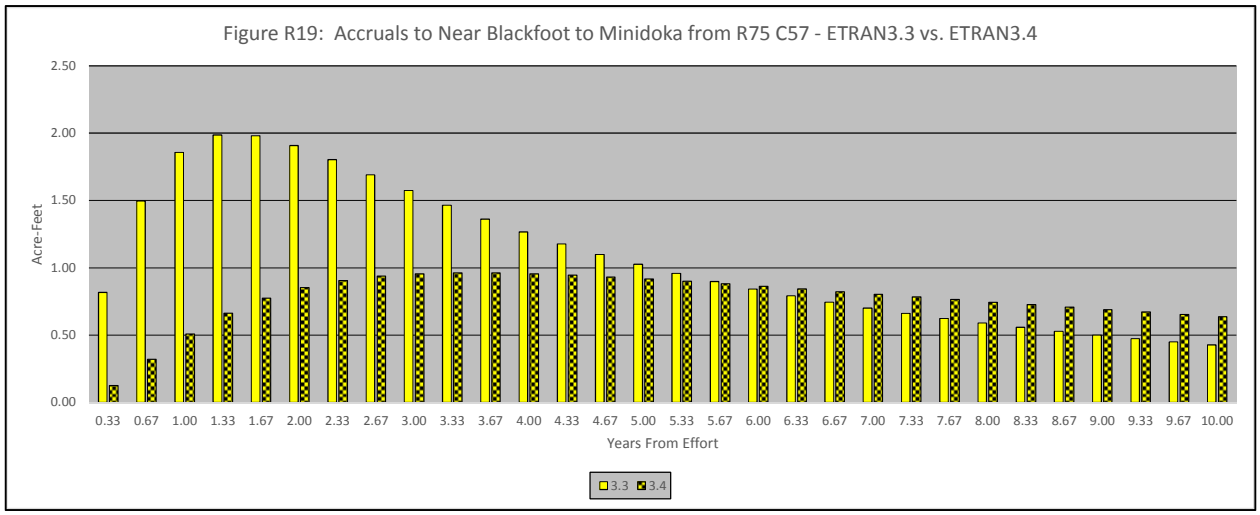

Figure R19.

EXHIBIT "A"
Page No. 27 of 33

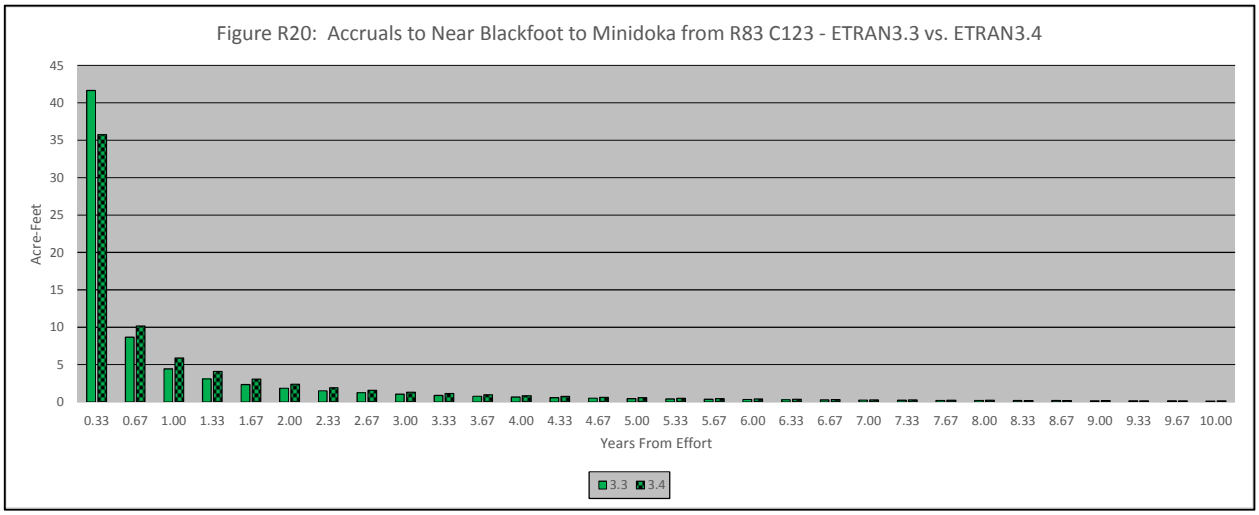

Figure R20.

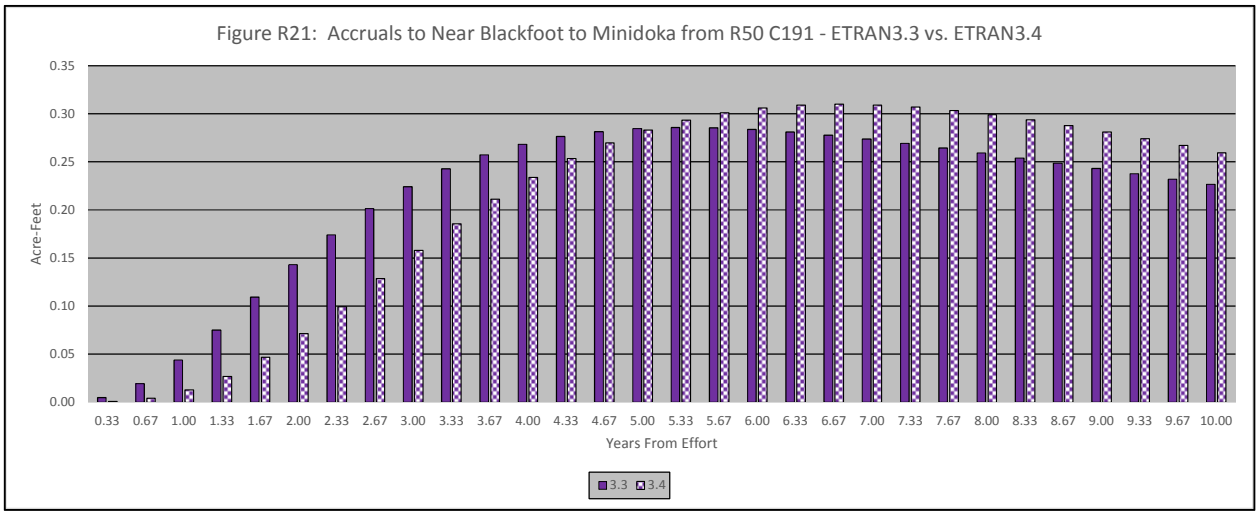

Figure R21.

A thoughtful reader might ask a policy question such as: "Is it fair to the SWC to use the model to estimate timing of accruals in the trimester of curtailment, when the two most recent best-available-science models differ by approximately a factor of six?" Technical analysis could inform policy deliberations about such a question.

Discussion of Technically-consistent Options

As indicated earlier, this report attempts to remedy a shortcoming identified by the hearing officer in another case, that expert reports offer no solutions. While implementation of a solution is a policy decision, technical work can help frame the understanding of what is possible, and what the implications of alternatives might be.

EXHIBIT "A"
Page No. 28 of 33

Alignment of Modeling Time Frame with Policy. In deposition in May 2023, Jennifer Sukow stated that she was *"told by Allan Wylie that [former Director] Karl Dreher did not want to use a transient analysis, because he did not like the additional volume of water that would accrue to the reach in future years."* This may have been how the decision was communicated, but it is likely that rather than not "liking" the result, the former Director deliberately selected steady-state analysis as a policy response to some of the temporal issues that have been explored above. However, applying the steady-state values only in years of shortfall still was technically inconsistent with the temporal delay in accrual. The Fifth Order methodology attempts to address that inconsistency but brings others, discussed above. The current methodology produces results such as seen in 2023, with curtailment of most groundwater irrigation threatened in a season of abundant snowpack and local flooding in some areas.

Visual inspection of Figure R16 suggests a cyclical pattern with a period of a few years. Robust time series analysis likely could quantify the periodicity. The periodicity likely could be partitioned into components of different periodicity, such as natural flow, return flows from surface-water irrigation, and groundwater contribution. Both time-series analysis and water-budget analysis could contribute to this understanding. Additionally, if the zeros in the hindcast were replaced by numerical values of surpluses that occurred, a statistical distribution of supply could be derived that would allow calculation of an appropriate level of conservatism to protect the SWC interests.

Similarly, as shown by Figures R8 through R13 and R19 through R20, the transient ESPAM model could be used to explore the characteristic time of response for curtailment of zones of similar hydraulic distance from the reach in question.

Combined, these two analyses could inform a curtailment scheme and a frequency of adaptive management that allowed the temporal pattern of need to be matched to the temporal response of reach gains to curtailment activities.

It is my professional opinion that a technically- and logically-coherent curtailment strategy could be constructed using either steady-state or transient analysis. The key would be to align the calculation and expectations of relief to the physical time frame of aquifer response. Something akin to Sukow's proposal for considering future accruals likely would be an important element.

Accounting for Non-Target Accruals. The key to accounting for non-target accruals is to be sure that the accounting decay of accruals, and the spatial assignment, match reality. A possible method is described in the Journal of the American Water Resources Association (Contor, 2009) that links transient *"aquifer response functions with double-entry accounting technologies"* and *"honors the hydrologic realities of groundwater/surface water interaction, the legal requirements of prior appropriation water law, and the economic requirements for equitable and efficient allocation of resources."*

Summary and Conclusions

My professional opinions regarding the Fifth Order are as follows:

- The arguments presented for transition to transient modeling are not factually correct, and therefore the true rationale has not been revealed.
    - Because I do not have access to the true rationale, I cannot assess it technically.
- Unless the criteria for accuracy and precision are very low, ESPAM2.2 is not sufficiently precise for monthly estimation of effects to the Near Blackfoot to Minidoka reach, for decisions that precipitate large financial burdens.
- The use of ESPAM modeling is technically defensible when ratios of relief to cost are considered in light of modeling precision, and when policy adjusts for spatial and temporal differences in response.
- The arguments presented against considering supplemental groundwater use within the SWC are not factually correct, and therefore I cannot technically assess the unrevealed true rationale.
- It is technically possible and reasonably achievable to assess and address supplemental groundwater use within the SWC.
- The following factors multiply the effect of ignoring supplemental groundwater use within the SWC:
    - Because of inherent characteristics of surface-water delivery systems, supplying one acre with surface water requires substantially more water than supplying an acre with groundwater.
    - Not all effects of curtailment of groundwater propagate to the Near Blackfoot to Minidoka reach, so more than one acre foot of curtailment is required to produce one acre foot of accrual.
    - When obligations are calculated on a transient basis, the temporal delay in propagation creates an additional multiplier of effort.
- Partitioning responsibility using a different modeling framework than was used to calculate curtailment can result in some users being held responsible for more mitigation than the relief that their curtailment would have provided.
- Technical methods exist to inform a coherent plan under either a transient or a steady-state paradigm.

Curriculum Vitae

Bryce A. Contor
5223 Steele Avenue, P.O. Box 94
Iona, Idaho 83427
208-681-9100

Summary Statement

Mr. Contor has worked in the hydrology field since 1996, including ten years with the Idaho Water Resources Research Institute where he served as a research hydrologist, and five years with Idaho Department of Water Resources where he served as a Senior Water Resource Agent. Prior to that he farmed and served on the board of directors of a small canal company.

With the Institute, Mr. Contor served as principal investigator on hydrologic projects as diverse as preparing water budgets for large numerical aquifer models, investigating remote sensing of evapotranspiration on irrigated lands, developing tools to calculate the economic demand for irrigation water, and investigating managed recharge of aquifers. He has published in national peer-reviewed scientific journals and has authored numerous technical completion reports for the Idaho Water Resources Research Institute. At Idaho Department of Water Resource, Mr. Contor measured flow in pipelines and open channels, investigated water-right claims and made water-right recommendations in the Snake River Basin Adjudication.

Mr. Contor holds an M.S. Degree in hydrology from the University of Idaho. His hydrologic specialties include groundwater/surface-water interactions and MODFLOW aquifer modeling, water-budget analysis, pipeline and open-channel flow measurement, and statistics. GIS specialties include aerial land photography interpretation and manipulation of remote-sensing data. Economics specialties are water banking and economic demand for irrigation water. He has extensive experience with water-budget preparation and with collaboration as a member of the development team for Enhanced Snake Plain Aquifer Models (ESPAM) versions 1.0 through 2.1, and the Spokane Valley – Rathdrum Prairie Model. Contor has served as an expert witness in water-related matters.

Education

University of Idaho, Idaho Falls, Idaho, 2005, M.S., Hydrology
Brigham Young University, Provo, Utah, 1994, B.S., Agricultural Economics. Cum Laude.
Ricks College, Rexburg, Idaho, 1980, A.S., Farm Crops Management

Work Experience

Hydrologist at Rocky Mountain Environmental Associates, Inc., Idaho Falls, Idaho, 2010 to Present. Currently serving as Principal Hydrologist.

EXHIBIT "B"
Page No. 1 of 7

Position includes aquifer modeling, hydrologic field investigation, hydrologic analysis, GIS and expert-witness work in support of Idaho water-rights transactions, negotiations and proceedings. For approximately two years, Mr. Contor reduced his work at Rocky Mountain Environmental Associates while doing landowner-outreach and technical work for the Henry's Fork Foundation and Friends of the Teton River.

Research Hydrologist of Idaho Water Resources Research Institute, University of Idaho, Idaho Falls, Idaho, 2001-2010

Position included serving as a principle investigator on a ground water banking project in cooperation with U.S. Bureau of Reclamation, as principle investigator in water-budget preparation for aquifer modeling projects, and field investigation in support of managed aquifer recharge. The position included GIS analysis and supervision of hydrologists and data technicians. During this period Mr. Contor sub-contracted field exams for the Snake River Basin Adjudication for Idaho Department of Water Resources.

Senior Water Resource Agent, Idaho Department of Water Resources and North Water Measurement District, 1996-2001

Duties included field and office evaluation of water-right claims, including flow measurements and characterization of conveyance and diversion structures, making water-right recommendations in the Snake River Basin Adjudication, and the measurement of water discharge and power consumption of irrigation wells for documentation of ground water withdrawal volumes.

Worked in irrigated agriculture from 1980 through 1995 as irrigation supervisor, farm manager, tenant farmer, farm owner, seed-company field representative, and Idaho Department of Agriculture chemigation inspector. In the late 1980s through early 1990s served as a board member and then as secretary of a small canal company.

Experience Testifying/Giving Depositions

Circa 2005: Deposed in matters related to the calibration of Enhanced Snake Plain Aquifer Model Version 1.0 and 1.1.

Circa 2012: Deposed and testified at hearing before IDWR regarding aquifer-modeling issues related to the Rangen Aquifer Delivery Call.

2016: Testified in behalf of the plaintiff in a civil case related to filling in of an irrigation ditch.

Circa 2019: Deposed and testified at hearing before IDWR regarding creation of the Eastern Snake Plain Aquifer Ground Water Management Area.

EXHIBIT "B"
Page No. 2 of 7

2021: Testified in behalf of protestant at hearing before IDWR regarding change in Point of Diversion of surface-water rights.

2023: Testified in behalf of applicant at hearing before IDWR regarding change in Point of Diversion and Place of Use of surface-water rights.

Statement regarding compensation

Bryce A. Contor serves as a Principal Hydrologist at Rocky Mountain Environmental Associates, Inc. (RMEA), in Idaho Falls, Idaho. RMEA invoices Bonneville Jefferson Ground District for Contor's services per the attached rate schedule.

EXHIBIT "C"
Page No. 1 of 2

2023 Labor & Equipment Rates

PROFESSIONAL RATE SCHEDULE	
Principal Engineer/Geologist/Hydrologist	$170.00 per hour
Senior Geologist/Water Right Analyst/GIS Analyst	$152.00 per hour
Geologist 3/Water Right Analyst 3/GIS Analyst 3	$135.00 per hour
Geologist 2/Water Right Analyst 2/GIS Analyst 2	$120.00 per hour
Geologist 1/ Water Right Analyst 1/GIS Analyst 1	$105.00 per hour
Geoscience Technician/GIS-Drafting/Field Assistant	$80.00 per hour
Clerical or Secretary	$65.00 per hour
Expert Witness Testimony	Base rate x 2
Laboratory Analysis	Cost plus 15%
Subcontracted Services (drilling, excavation)	Cost plus 15%
All other direct expenses	Cost plus 15%
RMEA-OWNED EQUIPMENT RENTAL	
Drone and Camera	$175.00 per day
GPS Unit	$30.00 per day
Soil Sampling and Decontamination Equipment	$30.00 per day
Photoionization Detector (PID)	$110.00 per day
Multi Gas Meter (LEL, H2S, CO)	$110.00 per day
Hand Auger Soil Sampling Kit	$45.00 per day
Electronic Water Level Meter	$55.00 per day
YSI (pH, Conductivity, DO, &Temp)	$160.00 per day
Turbidity Meter	55.00 per day
Downhole Datalogger	$110.00 per month
Portable DC Submersible Pump	$110.00 per day
Peristaltic Pump	$55.00 per day
Schoenstadt Magnetic Locator	$30.00 per day
NON-RMEA OWNED EQUIPMENT RENTAL	Cost plus 15%
TRAVEL & SHIPPING	
Mileage	$0.75 per mile
Per Diem (if applicable)	$160.00 per day
4-wheeler	$160.00 per day
Airfare or other purchased travel	Cost plus 15%
Sample Shipment (overnight via courier on ice)	$110.00 per cooler

BEFORE THE DEPARTMENT OF WATER RESOURCES
OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	IDWR Docket No. CM-DC-2010-001 **MOTION FOR DIRECTOR TO ISSUE SUBPOENAS**

COME NOW, the Cities of Bliss, Burley, Carey, Declo, Dietrich, Gooding, Hazelton, Heyburn, Jerome, Paul, Richfield, Rupert, Shoshone, and Wendell ("Coalition of Cities"), by and through their attorneys of record, Candice M. McHugh and Chris M. Bromley, the City of Idaho Falls, by and through its attorney of record, Robert L. Harris, and the City of Pocatello by and through its attorney of record Sarah A. Klahn (collectively the "Cities"), Idaho Ground Water Appropriators ("IGWA") by and through its attorney of record Thomas J. Budge, Bingham Ground Water District by and through its attorney, Dylan Anderson and Bonneville-

Jefferson Ground Water District, by and through its attorney Skyler Jones, (collectively the "Parties'), pursuant to Rules 523 and 220 of the Rules of Procedure of the Idaho Department of Water Resources (found at IDAPA 37.01.01), as well as I.R.C.P. 45, hereby moves Director Gary Spackman, the Hearing Officer in the above-entitled action, to issue subpoenas to the following individuals to appear and testify at the hearing currently scheduled for June 6-10, 2023, concerning the *Fifth Amended Methodology Order Regarding Methodology for Determining material Injury to Reasonable In-Season Demand And Reasonable Carryover* (the "*Fifth Methodology Order*") and a *Final Order Regarding April 2023 Forecast Supply* (the "*As-Applied Order*"):

1. **Mathew Weaver, P.E.**
   Deputy Director
   Idaho Department of Water Resources
   322 E. Front Street
   Boise, ID 83702

2. **Tony Olenichak**
   Water District 01 Watermaster
   900 N. Skyline Dr., Ste. A
   Idaho Falls, ID 83402-1718

The Parties intend to question Mr. Weaver as a lay witness on matters related to the Department's preparation and issuance of the *Fifth Methodology Order* and the *As-Applied Order*, including all information the Director considered in developing the orders. Additionally, the Parties intend to question Mr. Olenichak about water distribution and water supply in Water District 01, including availability of natural flow and storage water.

The Parties understand that Mr. Weaver is out of the country on a planned vacation, but consistent with other attorneys and hearing witnesses who are unavailable to participate in person because of planned vacations, Mr. Weaver can participate remotely. Mr. Olenichak should be required to appear in person given his presence in the State of Idaho, unless extenuating circumstances exist, in which case, Mr. Olenichak could also appear remotely. The Parties request

that Mr. Weaver and Mr. Olenichak be put on notice by the Director that they may be called as witnesses at any time during June 6-10 hearing, although the Parties anticipate discussing order of witnesses at the commencement of the hearing where the anticipated date and time of each witnesses' anticipating testimony will be discussed. As of the date of this filing, the Parties initially anticipate—which is subject to change—that both Mr. Weaver and Mr. Olenichak will testify on either Friday, June 9th, or Saturday, June 10th.

Dated this 1st day of June, 2023.

Attorneys for Idaho Ground Water Appropriators, Inc. (IGWA)

STATE OF IDAHO

DEPARTMENT OF WATER RESOURCES

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **IGWA's Amended Notice of Mitigation**

Idaho Ground Water Appropriators, Inc. ("IGWA"), acting on behalf of North Snake Ground Water District, Carey Valley Ground Water District, Magic Valley Ground Water District, Aberdeen-American Falls Ground Water District, Jefferson-Clark Ground Water District, Madison Ground Water District, Henry's Fork Ground Water District, Bonneville-Jefferson Ground Water District, and Bingham Ground Water District (collectively, the "Districts"), through their respective counsel, hereby provides notice that the Districts can mitigate for their proportionate share of the demand shortfall predicted in the *Final Order Regarding April Forecast Supply (Methodology Steps 1-3)* ("*April 2023 As-Applied Order*") issued April 21, 2023, in this matter.

Background

The *April 2023 As-Applied Order* applies steps 1-3 of the Fifth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover. It predicts that the Surface Water Coalition ("SWC") will experience an in-season demand shortfall of 75,200 acre-feet in the absence of mitigation by junior-priority groundwater users. The order states: "On or before May 5, 2023, ground water users holding consumptive water

rights bearing priority dates junior to December 30, 1953, within the Eastern Snake Plain Aquifer area of common ground water supply shall establish, to the satisfaction of the Director, that they can mitigate for their proportionate share of the predicted DS of 75,200 acre-feet in accordance with an approved mitigation plan." (*April 2023 As-Applied Order*, p. 6.) "IGWA's proportionate share of the predicted DS of 75,200 acre-feet is 63,645 acre-feet." *Id*. at 5, fn 5.

IGWA has three approved mitigation plans. Its "Storage Water Plan" authorizes its member ground water districts to provide mitigation via the delivery of storage water to the SWC. (Order Approving Mitigation Plan, *In the Matter of the Idaho Ground Water Appropriators, Inc.'s Mitigation Plan in Response to the Surface Water Coalition's Water Delivery Call*, IDWR Docket No. CM-MP-2009-007, June 3, 2010, p. 10.) Under this plan, "IGWA must provide proof of rental or an option to rent storage water and of a commitment of the storage water to the SWC within the deadlines provided by the Methodology Order and any order of the Director implementing the Methodology Order for a given year." *Id*.

IGWA's "Aquifer Enhancement Plan" authorizes its member ground water districts to obtain mitigation credit for reach gains that accrue to the SWC as a result of (a) conversions of farmland from groundwater to surface water irrigation; (b) fallowing of groundwater-irrigated acres through the Conservation Reserve Enhancement Program (CREP), Agricultural Water Enhancement Program (AWEP), or other voluntary program; and (c) groundwater recharge." (Order Approving Mitigation Plan, *In the Matter of the Idaho Ground Water Appropriators, Inc.'s Mitigation Plan for Conversions, Dry-Ups, and Recharge*, IDWR Docket No. CM-MP-2009-006, May 14, 2010, p. 1.) Under this plan, "[i]f mitigation credit is sought by IGWA, the Director shall determine the appropriate credit, if any, to provide." *Id*. at 2.

IGWA's "Settlement Agreement Plan" authorizes its member ground water districts to obtain mitigation protection by complying with a settlement agreement entered into between them and the SWC in 2015. (Final Order Approving Stipulated Mitigation Plan, *In the Matter of IGWA's Settlement Agreement Mitigation Plan*, IDWR Docket No. CM-MP-2016-001, May 2, 2016; Final Order Approving Amendment to Stipulated Mitigation Plan, *In the Matter of IGWA's Settlement Agreement Mitigation Plan*, IDWR Docket No. CM-MP-2016-001, May 9, 2017.) Under this plan, each district is required to conserve its proportionate share of 240,000 acre-feet of groundwater and collectively deliver 50,000 acre-feet of storage annually to the SWC as set forth in the *Amended Final Order Regarding Compliance with Approved Plan* issued April 24, 2023.

On May 5, 2023, IGWA filed a *Notice of Ground Water District Mitigation* stating that some of its member ground water districts would mitigate under IGWA's Storage Water Plan and others would mitigate under IGWA's Settlement Agreement Plan, in accordance with their respective proportionate mitigation obligations under each plan. On May 23, 2023, the Director issued an *Order Determining Deficiency in IGWA's Notice of Secured Water* which ruled that IGWA is not allowed to apportion mitigation obligations under the Storage Water Plan or the Settlement Agreement Plan based on each ground water district's proportionate share. In effect, the order requires ground water districts to mitigate under one plan only. Based on the May 23 order, IGWA files this amended notice of mitigation.

Notice of Mitigation

IGWA will mitigate under the Storage Water Plan in 2023. The *April 2023 As-Applied Order* states that IGWA's share of the total predicted demand shortfall of 75,200 acre-feet is 63,645 acre-feet. (*April 2023 As-Applied Order*, p. 5, fn 5.) Attached hereto as Appendix A are copies of storage lease contracts secured by IGWA's member ground water districts totaling 77,714 acre-feet.

The *Order Determining Deficiency in IGWA's Notice of Secured Water* orders, for the first time, that the Districts not only provide contracts showing the water they have secured, but that they pay the Water District 1 fees in addition. The Districts object to this because the order approving the Storage Water Plan does not require IGWA to pay the Water District 1 fees before the date that storage water is committed to the SWC. (Order Approving Mitigation Plan, *In the Matter of Idaho Ground Water Appropriators, Inc.'s Mitigation Plan In Response To The Surface Water Coalition's Water Delivery Call*, IDWR Docket No. CM-MP-2009-007, June 3, 2010.) To the contrary, the order allows IGWA to "provide proof of rental or an option to rent storage water," and that "proof of rental or an option to rent storage water shall consist of fully executed and irrevocable contracts with holders of Snake River storage." By the nature of option contracts, fees due to Water District 1 cannot be paid until the option is exercised. It is also significant that IGWA has never failed to pay the Water District 1 fees due under any storage contract for mitigation water delivered to the SWC.

Without waiving IGWA's objection to the prepayment of Water District 1 fees, IGWA's member districts have gone ahead and paid the Water District 1 fees for 2023. IGWA reserves the right to secure storage water in future years and pay Water District 1 fees at the time such storage is transferred to the SWC.

Dated this 1st day of June, 2023.

APPENDIX A

Storage Leases

WATER DISTRICT #1 RENTAL POOL - PRIVATE LEASE AGREEMENT

Idaho Irrigation District (lessor) agrees to lease 6,678 acre-feet of storage to Bingham Ground Water District (lessee) for the 2023 irrigation season at a price of $[redacted] according to the rules and regulations contained in the Water District #1 Rental Pool Procedures.

Description of Lease:

Name of River or Stream from which lease is diverted: Snake River

Canal or Pump Name and location: TBD

Place of Use description: TBD

Water Right Appurtenant to Lands: TBD

An Idaho Water Resources Board surcharge (10% of the purchase price) plus a $1.30 per acre-foot administrative fee must be received by Water District #1 prior to the approval of the storage lease).

If the reservoir storage system fails to fill in the season following the year leased, the lessor's storage allocation shall be reduced by the amount leased to offset any impacts to other spaceholders' storage accruals according to the approved Water District #1 Rental Pool Procedures pursuant to Idaho Code Section 42-1765. The lessor understands the net effect of this rule is to make an amount of the lessor's space (equal to the amount leased) last-to-fill in the reservoir system for the irrigation season following the lease.

☐ If the lease is for irrigation purposes, the Applicant, by checking this box, certifies that the use of this leased storage water complies with the moratorium on new consumptive uses as outlined in Rental Pool Procedure 3.4. Failure to meet the conditions contained in Rental Pool Procedure 3.4 may be grounds for denying the application.

If the leased storage is diverted by a diversion outside the area regulated by Water District #1, the applicant, by signing this agreement agrees to report to the Watermaster of the water district containing the diversion, the daily amounts of leased storage diverted during the year. The Watermaster of that district, according to Rental Pool Procedure 4.3.108, must then report to the Water District #1 Watermaster the daily rental diverted by November 30th. Failure to report the daily rental diversion may result in the rental not being delivered in Water District #1's final rental delivery records.

Water Right Appurtenant to Lands: TBD

An Idaho Water Resources Board surcharge (10% of the purchase price) plus a $1.30 per acre-foot administrative fee must be received by Water District #1 prior to the approval of the storage lease).

If the reservoir storage system fails to fill in the season following the year leased, the lessor's storage allocation shall be reduced by the amount leased to offset any impacts to other spaceholders' storage accruals according to the approved Water District #1 Rental Pool Procedures pursuant to Idaho Code Section 42-1765. The lessor understands the net effect of this rule is to make an amount of the lessor's space (equal to the amount leased) last-to-fill in the reservoir system for the irrigation season following the lease.

☐ If the lease is for irrigation purposes, the Applicant, by checking this box, certifies that the use of this leased storage water complies with the moratorium on new consumptive uses as outlined in Rental Pool Procedure 3.4. Failure to meet the conditions contained in Rental Pool Procedure 3.4 may be grounds for denying the application.

If the leased storage is diverted by a diversion outside the area regulated by Water District #1, the applicant, by signing this agreement agrees to report to the Watermaster of the water district containing the diversion, the daily amounts of leased storage diverted during the year. The Watermaster of that district, according to Rental Pool Procedure 4.3.108, must then report to the Water District #1 Watermaster the daily rental diverted by November 30th. Failure to report the daily rental diversion may result in the rental not being delivered in Water District #1's final rental delivery records.

STORAGE WATER LEASE

This Storage Water Lease ("Lease") is entered into between Enterprize Canal Co., whose mailing address is PO BOX 583, Ririe, ID 83443, ("Lessor"), and the Bonneville Jefferson Ground Water District whose mailing address is P.O. Box 51121, Idaho Falls, Idaho 83204.

RECITALS

A. Lessor has the right to use, lease, and assign storage water allocated and available to Lessor as a space holder in the Idaho Water District 1 reservoir system pursuant to Lessor's Storage Water Contracts with the United States Bureau of Reclamation ("Reclamation").

B. BONNEVILLE JEFFERSON GROUND WATER DISTRICT desires to lease storage water to satisfy mitigation obligations determined by the Director of the Idaho Department of Water Resources ("Department") and related purposes, such as aquifer recharge and converting farmland from ground to surface water irrigation.

C. Lessor desires to lease storage water to BONNEVILLE JEFFERSON GROUND WATER DISTRICT, and BONNEVILLE JEFFERSON GROUND WATER DISTRICT desires to lease storage water from Lessor, pursuant to the terms of this Lease.

LEASE

1. **Storage Water Lease.** Lessor hereby leases to Bonneville Jefferson Ground Water District 4,000 acre feet of storage water for 2023 only, at which the Bonneville Jefferson Ground Water District is required to pay rent at a rate of $[redacted].

2. **Term.** The initial term of this Lease shall be for a period of one (1) year, commencing January 1, 2023, and ending December 31, 2023.

3. **Payment of Rent.** Bonneville Jefferson Ground Water District will pay the rent to Lessor in two equal installments. The first installment on or before May 1, of 2023, and the final installment on or before November 1, of 2023.

4. **Administrative Fees.** BONNEVILLE JEFFERSON GROUND WATER DISTRICT will pay all administrative fees imposed by Water District 1 and the Idaho Water Resource Board.

5. **Use of Leased Water.**
   5.1 The assignment, delivery, and use of leased storage water will be determined by BONNEVILLE JEFFERSON GROUND WATER DISTRICT and is subject to the final accounting for the year by the Watermaster of Water District 1

and any applicable Water District 1 Rental Pool Rules.

5.2 This Lease does not include any right to use storage water below Milner Dam.

5.3 The storage water available to Bonneville Jefferson Ground Water District under this Lease may be assigned and delivered by Bonneville Jefferson Ground Water District to any of its members or to any other person or entity for the authorized uses of recharge, mitigation, irrigation, or other lawful use at any time up to December 1 each year.

5.4 Any storage water not used or assigned by Bonneville Jefferson Ground Water District by December 1 shall remain in Lessor's Water District 1 storage account and then belong only to Lessor.

5.5 Lessor understands that any storage water leased may be subject to the Water District 1 Rental Pool Rules.

6. **Representations by Lessor.** Lessor covenants and represents that:

6.1 It will provide to Bonneville Jefferson Ground Water District all storage water leased under this Lease.

6.2 It is the true and lawful owner of the storage water and that nothing restricts or precludes Lessor from entering into this Lease.

7. **Breach.** If either party defaults in the performance of its obligations under this Lease, and such default is not cured within thirty (30) days after receipt of written notice thereof, the non-breaching party, at its option, may elect to pursue remedies for breach of contract in district court.

8. **Assignment.** This Lease may not be assigned by Bonneville Jefferson Ground Water District without the express written consent of Lessor, but the storage water leased by Bonneville Jefferson Ground Water District under this Lease may be assigned or otherwise made available to any other person or entity.

9. **Dispute Resolution.** Any substantial dispute between the parties shall be resolved in accordance with the following provisions.

9.1 Good Faith Negotiation. Upon written notice from one party to the other, authorized representatives of the parties will attempt in good faith to resolve the dispute by negotiation.

9.2 Mediation. If the dispute cannot be resolved by good faith negotiation, either party may demand that the dispute be subjected to mediation

by a mediator designated by mutual Lease of the parties. The mediation will be held in Bonneville County, Idaho, unless the parties mutually agree to a different location. Mediator costs will be split equally between the parties.

9.3 Litigation. Litigation is allowed between the parties only: (i) if the dispute is not resolved by mediation, (ii) for the purpose of enforcing a settlement Lease entered into between the parties, or (iii) to seek temporary injunctive relief if a party deems such action necessary to avoid irreparable damage. The pursuit or granting of temporary injunctive relief does not excuse the parties from participating in good faith negotiation and mediation as set forth above. The prevailing party in any litigation is entitled to recover reasonable attorney fees and costs.

9.4 Governing Law, Jurisdiction, and Venue. This Lease will be construed and interpreted in accordance with the laws of the State of Idaho. The parties agree that the courts of Idaho shall have exclusive jurisdiction, and agree that Bonneville County is the proper venue.

9.5 Exclusive Procedures. The procedures specified in this section 9 are the exclusive procedures for the resolution of disputes between the parties. All applicable statutes of limitation shall be tolled while the negotiation and mediation procedures specified in section 9.3 are pending.

10. **Notices.** All notices given pursuant to this Lease must be in writing and shall be sent in one of the following manners: (a) by certified mail, return receipt requested, postage prepaid; (b) by recognized overnight courier such as Federal Express; (c) by facsimile transmission; (d) by email if the receiving party acknowledges receipt of the emailed notice. Notices shall be deemed received on the earlier of actual receipt, three days after mailing for certified mail and regular mail, the next business day if given by fax, or the date the receiving party acknowledges receipt of email notice.

ADDRESSES TO BE USED FOR NOTICES AND DELIVERY OF LEASE PAYMENTS SHALL BE AS FOLLOWS:

Lessor: Enterprize Canal Co.
PO BOX 583
Ririe, ID 83443

Lessee: Bonneville Jefferson Ground Water District:
PO Box 51121
Idaho Falls, ID 83405

Either party may change its designated address by providing written notice of such change to the other party.

11. **Binding Effect.** This Lease shall be binding upon the respective heirs, successors, and assigns of the parties.

STORAGE WATER LEASE

This Storage Water Lease ("Lease") is entered into between Idaho Irrigation District, whose address is 496 E 14th St, Idaho Falls, ID 83404, Idaho Falls, Idaho 83402 ("Lessor"), and the Bonneville Jefferson Ground Water District whose mailing address is P.O. Box 51121, Idaho Falls, Idaho 83204.

RECITALS

A. Lessor has the right to use, lease, and assign storage water allocated and available to Lessor as a space holder in the Idaho Water District 1 reservoir system pursuant to Lessor's Storage Water Contracts with the United States Bureau of Reclamation ("Reclamation").

B. BONNEVILLE JEFFERSON GROUND WATER DISTRICT desires to lease storage water to satisfy mitigation obligations determined by the Director of the Idaho Department of Water Resources ("Department") and related purposes, such as aquifer recharge and converting farmland from ground to surface water irrigation.

C. Lessor desires to lease storage water to BONNEVILLE JEFFERSON GROUND WATER DISTRICT, and BONNEVILLE JEFFERSON GROUND WATER DISTRICT desires to lease storage water from Lessor, pursuant to the terms of this Lease.

LEASE

1. **Storage Water Lease.** Lessor hereby leases to Bonneville Jefferson Ground Water District 4,000 acre feet of storage water for 2023 only, at which the Bonneville Jefferson Ground Water District is required to pay rent at a rate of $[redacted].

2. **Term.** The initial term of this Lease shall be for a period of one (1) year, commencing January 1, 2023, and ending December 31, 2023.

3. **Payment of Rent.** Bonneville Jefferson Ground Water District will pay the rent to Lessor in two equal installments. The first installment on or before May 1, of 2023, and the final installment on or before November 1, of 2023. JULY 15

4. **Administrative Fees.** BONNEVILLE JEFFERSON GROUND WATER DISTRICT will pay all administrative fees imposed by Water District 1 and the Idaho Water Resource Board.

5. **Use of Leased Water.**

5.1 The assignment, delivery, and use of leased storage water will be determined by BONNEVILLE JEFFERSON GROUND WATER DISTRICT and is subject to the final accounting for the year by the Watermaster of Water District 1

and any applicable Water District 1 Rental Pool Rules.

5.2 This Lease does not include any right to use storage water below Milner Dam.

5.3 The storage water available to Bonneville Jefferson Ground Water District under this Lease may be assigned and delivered by Bonneville Jefferson Ground Water District to any of its members or to any other person or entity for the authorized uses of recharge, mitigation, irrigation, or other lawful use at any time up to December 1 each year.

5.4 Any storage water not used or assigned by Bonneville Jefferson Ground Water District by December 1 shall remain in Lessor's Water District 1 storage account and then belong only to Lessor.

5.5 Lessor understands that any storage water leased may be subject to the Water District 1 Rental Pool Rules.

6. **Representations by Lessor.** Lessor covenants and represents that:

6.1 It will provide to Bonneville Jefferson Ground Water District all storage water leased under this Lease.

6.2 It is the true and lawful owner of the storage water and that nothing restricts or precludes Lessor from entering into this Lease.

7. **Breach.** If either party defaults in the performance of its obligations under this Lease, and such default is not cured within thirty (30) days after receipt of written notice thereof, the non-breaching party, at its option, may elect to pursue remedies for breach of contract in district court.

8. **Assignment.** This Lease may not be assigned by Bonneville Jefferson Ground Water District without the express written consent of Lessor, but the storage water leased by Bonneville Jefferson Ground Water District under this Lease may be assigned or otherwise made available to any other person or entity.

9. **Dispute Resolution.** Any substantial dispute between the parties shall be resolved in accordance with the following provisions.

9.1 Good Faith Negotiation. Upon written notice from one party to the other, authorized representatives of the parties will attempt in good faith to resolve the dispute by negotiation.

9.2 Mediation. If the dispute cannot be resolved by good faith negotiation, either party may demand that the dispute be subjected to mediation

11. **Binding Effect.** This Lease shall be binding upon the respective heirs, successors, and assigns of the parties.

STORAGE WATER LEASE

This Storage Water Lease ("Lease") is entered into between Snake River Valley Irrigation District, whose address is 816 N. 700 E., with a mailing address at PO BOX 70, Basalt, ID 83218, ("Lessor"), and the Bonneville Jefferson Ground Water District whose mailing address is P.O. Box 51121, Idaho Falls, Idaho 83204.

RECITALS

A. Lessor has the right to use, lease, and assign storage water allocated and available to Lessor as a space holder in the Idaho Water District 1 reservoir system pursuant to Lessor's Storage Water Contracts with the United States Bureau of Reclamation ("Reclamation").

B. BONNEVILLE JEFFERSON GROUND WATER DISTRICT desires to lease storage water to satisfy mitigation obligations determined by the Director of the Idaho Department of Water Resources ("Department") and related purposes, such as aquifer recharge and converting farmland from ground to surface water irrigation.

C. Lessor desires to lease storage water to BONNEVILLE JEFFERSON GROUND WATER DISTRICT, and BONNEVILLE JEFFERSON GROUND WATER DISTRICT desires to lease storage water from Lessor, pursuant to the terms of this Lease.

LEASE

1. **Storage Water Lease**. Lessor hereby leases to Bonneville Jefferson Ground Water District 4,000 acre feet of storage water for 2023 only, at which the Bonneville Jefferson Ground Water District is required to pay rent at a rate of $[redacted].

2. **Term**. The initial term of this Lease shall be for a period of one (1) year, commencing January 1, 2023, and ending December 31, 2023.

3. **Payment of Rent**. Bonneville Jefferson Ground Water District will pay the rent to Lessor in two equal installments. The first installment on or before May 1, of 2023, and the final installment on or before November 1, of 2023.

4. **Administrative Fees**. BONNEVILLE JEFFERSON GROUND WATER DISTRICT will pay all administrative fees imposed by Water District 1 and the Idaho Water Resource Board.

5. **Use of Leased Water**.

   5.1 The assignment, delivery, and use of leased storage water will be determined by BONNEVILLE JEFFERSON GROUND WATER DISTRICT and is subject to the final accounting for the year by the Watermaster of Water District 1 and any applicable Water District 1 Rental Pool Rules.

5.2 This Lease does not include any right to use storage water below Milner Dam.

5.3 The storage water available to Bonneville Jefferson Ground Water District under this Lease may be assigned and delivered by Bonneville Jefferson Ground Water District to any of its members or to any other person or entity for the authorized uses of recharge, mitigation, irrigation, or other lawful use at any time up to December 1 each year.

5.4 Any storage water not used or assigned by Bonneville Jefferson Ground Water District by December 1 shall remain in Lessor's Water District 1 storage account and then belong only to Lessor.

5.5 Lessor understands that any storage water leased may be subject to the Water District 1 Rental Pool Rules.

6. **Representations by Lessor**. Lessor covenants and represents that:

6.1 It will provide to Bonneville Jefferson Ground Water District all storage water leased under this Lease.

6.2 It is the true and lawful owner of the storage water and that nothing restricts or precludes Lessor from entering into this Lease.

7. **Breach**. If either party defaults in the performance of its obligations under this Lease, and such default is not cured within thirty (30) days after receipt of written notice thereof, the non-breaching party, at its option, may elect to pursue remedies for breach of contract in district court.

8. **Assignment**. This Lease may not be assigned by Bonneville Jefferson Ground Water District without the express written consent of Lessor, but the storage water leased by Bonneville Jefferson Ground Water District under this Lease may be assigned or otherwise made available to any other person or entity.

9. **Dispute Resolution**. Any substantial dispute between the parties shall be resolved in accordance with the following provisions.

9.1 Good Faith Negotiation. Upon written notice from one party to the other, authorized representatives of the parties will attempt in good faith to resolve the dispute by negotiation.

9.2 Mediation. If the dispute cannot be resolved by good faith negotiation, either party may demand that the dispute be subjected to mediation

by a mediator designated by mutual Lease of the parties. The mediation will be held in Bonneville County, Idaho, unless the parties mutually agree to a different location. Mediator costs will be split equally between the parties.

9.3 Litigation. Litigation is allowed between the parties only: (i) if the dispute is not resolved by mediation, (ii) for the purpose of enforcing a settlement Lease entered into between the parties, or (iii) to seek temporary injunctive relief if a party deems such action necessary to avoid irreparable damage. The pursuit or granting of temporary injunctive relief does not excuse the parties from participating in good faith negotiation and mediation as set forth above. The prevailing party in any litigation is entitled to recover reasonable attorney fees and costs.

9.4 Governing Law, Jurisdiction, and Venue. This Lease will be construed and interpreted in accordance with the laws of the State of Idaho. The parties agree that the courts of Idaho shall have exclusive jurisdiction, and agree that Bonneville County is the proper venue.

9.5 Exclusive Procedures. The procedures specified in this section 9 are the exclusive procedures for the resolution of disputes between the parties. All applicable statutes of limitation shall be tolled while the negotiation and mediation procedures specified in section 9.3 are pending.

10. **Notices**. All notices given pursuant to this Lease must be in writing and shall be sent in one of the following manners: (a) by certified mail, return receipt requested, postage prepaid; (b) by recognized overnight courier such as Federal Express; (c) by facsimile transmission; (d) by email if the receiving party acknowledges receipt of the emailed notice. Notices shall be deemed received on the earlier of actual receipt, three days after mailing for certified mail and regular mail, the next business day if given by fax, or the date the receiving party acknowledges receipt of email notice.

STORAGE WATER LEASE

This Storage Water Lease ("Lease") is entered into between Idaho Irrigation District, whose address is 496 E 14th St, Idaho Falls, ID 83404, Idaho Falls, Idaho 83402 ("Lessor"), and the Bonneville Jefferson Ground Water District whose mailing address is P.O. Box 51121, Idaho Falls, Idaho 83204.

RECITALS

A. Lessor has the right to use, lease, and assign storage water allocated and available to Lessor as a space holder in the Idaho Water District 1 reservoir system pursuant to Lessor's Storage Water Contracts with the United States Bureau of Reclamation ("Reclamation").

B. BONNEVILLE JEFFERSON GROUND WATER DISTRICT desires to lease storage water to satisfy mitigation obligations determined by the Director of the Idaho Department of Water Resources ("Department") and related purposes, such as aquifer recharge and converting farmland from ground to surface water irrigation.

C. Lessor desires to lease storage water to BONNEVILLE JEFFERSON GROUND WATER DISTRICT, and BONNEVILLE JEFFERSON GROUND WATER DISTRICT desires to lease storage water from Lessor, pursuant to the terms of this Lease.

LEASE

1. **Storage Water Lease.** Lessor hereby leases to Bonneville Jefferson Ground Water District 2500 acre feet of storage water for 2023 only, at which the Bonneville Jefferson Ground Water District is required to pay rent at a rate of [redacted] per acre-foot ([redacted] total).

2. **Term.** The initial term of this Lease shall be for a period of one (1) year, commencing January 1, 2023, and ending December 31, 2023.

3. **Payment of Rent.** Bonneville Jefferson Ground Water District will pay the rent to Lessor in two equal installments. The first installment on or before July 1, of 2023, and the final installment on or before November 1, of 2023.

4. **Administrative Fees.** BONNEVILLE JEFFERSON GROUND WATER DISTRICT will pay all administrative fees imposed by Water District 1 and the Idaho Water Resource Board.

5. **Use of Leased Water.**
   5.1 The assignment, delivery, and use of leased storage water will be determined by BONNEVILLE JEFFERSON GROUND WATER DISTRICT and is subject to the final accounting for the year by the Watermaster of Water District 1

and any applicable Water District 1 Rental Pool Rules.

5.2 This Lease does not include any right to use storage water below Milner Dam.

5.3 The storage water available to Bonneville Jefferson Ground Water District under this Lease may be assigned and delivered by Bonneville Jefferson Ground Water District to any of its members or to any other person or entity for the authorized uses of recharge, mitigation, irrigation, or other lawful use at any time up to December 1 each year.

5.4 Any storage water not used or assigned by Bonneville Jefferson Ground Water District by December 1 shall remain in Lessor's Water District 1 storage account and then belong only to Lessor.

5.5 Lessor understands that any storage water leased may be subject to the Water District 1 Rental Pool Rules.

6. **Representations by Lessor.** Lessor covenants and represents that:

6.1 It will provide to Bonneville Jefferson Ground Water District all storage water leased under this Lease.

6.2 It is the true and lawful owner of the storage water and that nothing restricts or precludes Lessor from entering into this Lease.

7. **Breach.** If either party defaults in the performance of its obligations under this Lease, and such default is not cured within thirty (30) days after receipt of written notice thereof, the non-breaching party, at its option, may elect to pursue remedies for breach of contract in district court.

8. **Assignment.** This Lease may not be assigned by Bonneville Jefferson Ground Water District without the express written consent of Lessor, but the storage water leased by Bonneville Jefferson Ground Water District under this Lease may be assigned or otherwise made available to any other person or entity.

9. **Dispute Resolution.** Any substantial dispute between the parties shall be resolved in accordance with the following provisions.

9.1 Good Faith Negotiation. Upon written notice from one party to the other, authorized representatives of the parties will attempt in good faith to resolve the dispute by negotiation.

9.2 Mediation. If the dispute cannot be resolved by good faith negotiation, either party may demand that the dispute be subjected to mediation

by a mediator designated by mutual Lease of the parties. The mediation will be held in Bonneville County, Idaho, unless the parties mutually agree to a different location. Mediator costs will be split equally between the parties.

9.3 Litigation. Litigation is allowed between the parties only: (i) if the dispute is not resolved by mediation, (ii) for the purpose of enforcing a settlement Lease entered into between the parties, or (iii) to seek temporary injunctive relief if a party deems such action necessary to avoid irreparable damage. The pursuit or granting of temporary injunctive relief does not excuse the parties from participating in good faith negotiation and mediation as set forth above. The prevailing party in any litigation is entitled to recover reasonable attorney fees and costs.

9.4 Governing Law, Jurisdiction, and Venue. This Lease will be construed and interpreted in accordance with the laws of the State of Idaho. The parties agree that the courts of Idaho shall have exclusive jurisdiction, and agree that Bonneville County is the proper venue.

9.5 Exclusive Procedures. The procedures specified in this section 9 are the exclusive procedures for the resolution of disputes between the parties. All applicable statutes of limitation shall be tolled while the negotiation and mediation procedures specified in section 9.3 are pending.

10. **Notices.** All notices given pursuant to this Lease must be in writing and shall be sent in one of the following manners: (a) by certified mail, return receipt requested, postage prepaid; (b) by recognized overnight courier such as Federal Express; (c) by facsimile transmission; (d) by email if the receiving party acknowledges receipt of the emailed notice. Notices shall be deemed received on the earlier of actual receipt, three days after mailing for certified mail and regular mail, the next business day if given by fax, or the date the receiving party acknowledges receipt of email notice.

ADDRESSES TO BE USED FOR NOTICES AND DELIVERY OF LEASE PAYMENTS SHALL BE AS FOLLOWS:

Lessor: Idaho Irrigation District

WATER DISTRICT #1 RENTAL POOL - PRIVATE LEASE AGREEMENT

Idaho Irrigation District (lessor) agrees to lease 2500 acre-feet of storage to Bonneville Jefferson Ground Water District (lessee) for the 2023 irrigation season at a price of $325,000.00 according to the rules and regulations contained in the Water District #1 Rental Pool Procedures.

Description of Lease:

Name of River or Stream from which lease is diverted: Snake River

Canal or Pump Name and location: To be determined

Place of Use description: To be determined

Water Right Appurtenant to Lands: To be determined

An Idaho Water Resources Board surcharge (10% of the purchase price) plus a $1.30 per acre-foot administrative fee must be received by Water District #1 prior to the approval of the storage lease).

If the reservoir storage system fails to fill in the season following the year leased, the lessor's storage allocation shall be reduced by the amount leased to offset any impacts to other spaceholders' storage accruals according to the approved Water District #1 Rental Pool Procedures pursuant to Idaho Code Section 42-1765. The lessor understands the net effect of this rule is to make an amount of the lessor's space (equal to the amount leased) last-to-fill in the reservoir system for the irrigation season following the lease.

[X] If the lease is for irrigation purposes, the Applicant, by checking this box, certifies that the use of this leased storage water complies with the moratorium on new consumptive uses as outlined in Rental Pool Procedure 3.4. Failure to meet the conditions contained in Rental Pool Procedure 3.4 may be grounds for denying the application.

If the leased storage is diverted by a diversion outside the area regulated by Water District #1, the applicant, by signing this agreement agrees to report to the Watermaster of the water district containing the diversion, the daily amounts of leased storage diverted during the year. The Watermaster of that district, according to Rental Pool Procedure 4.3.108, must then report to the Water District #1 Watermaster the daily rental diverted by November 30th. Failure to report the daily rental diversion may result in the rental not being delivered in Water District #1's final rental delivery records.

MULTI-YEAR TRIBAL WATER LEASE AGREEMENT

This WATER LEASE ("**Lease Agreement**") is made and entered into by and between the SHOSHONE-BANNOCK TRIBES of the Fort Hall Reservation ("Tribes"), acting through the Tribal Rental Pool Committee in the operation of the Tribal Water Supply Bank and the Fort Hall Business Council, and the IDAHO GROUND WATER APPROPRIATORS, INC., a non-profit corporation, acting for and on behalf of North Snake Ground Water District, Magic Valley Ground Water District, Southwest Irrigation District, American Falls – Aberdeen Ground Water District and Carey Valley Ground Water District, (collectively "IGWA") and is effective on the date executed by both parties hereto.

RECITALS

A. Pursuant to *The 1990 Fort Hall Indian Water Rights Agreement*, the Tribes are entitled to federal storage contract rights, held in trust for the Tribes by the United States, in an amount of 2.8059% of the storage space in American Falls Reservoir and 6.9917% of the storage space in Palisades Reservoir. These contract storage rights are equivalent to full capacity volumes of 46,931 acre-feet in American Falls Reservoir and 83,900 acre-feet in Palisades Reservoir, and those water rights and the associated volumes of water are referred to herein as the "**Tribal Water Supply Bank**." Due to sedimentation, the maximum annual volumes accrued to each of the contract storage rights are less than the stated capacity volumes.

B. The Shoshone-Bannock Tribes have adopted the Shoshone-Bannock Tribal Water Supply Bank Rules, which have been duly approved by the Idaho Water Resources Board, for the purposes of leasing storage water held by the Tribes in American Falls Reservoir for delivery and use in the Snake River Basin anywhere within Idaho, and for leasing storage water held by the Tribes in Palisades Reservoir for delivery and use in the Snake River Basin above Milner Dam.

C. IGWA is a non-profit corporation which was established to represent its membership, which is currently comprised of eight groundwater districts, two irrigation districts, and numerous other municipal, commercial, and industrial groundwater users in Idaho. IGWA has entered into an agreement with the Surface Water Coalition to resolve disputes related to the impacts of groundwater use on surface water rights. IGWA desires to lease storage water from the Tribes based on the terms herein for use as mitigation flow in the Snake River and for use in meeting other aspects of the agreement.

Now, therefore, and in consideration of the covenants, obligations, and other valuable consideration referred to herein, the Tribes and IGWA agree as follows:

1. Quantity of Leased Water. The water that is the subject of this Lease Agreement is referred to herein as the "**Rental Volume**". The quantity of Rental Volume shall be defined under the terms below.

   a. Each year of the Lease Agreement, the Tribes will commit to provide and IGWA will commit to rent from the Tribes a volume of up to 25,000 acre-feet, subject to the terms and conditions provided below.

b. The Rental Volume will be supplied from the Tribal Water Supply Bank, which is comprised of the Tribes' federal contract storage rights in American Falls and Palisades Reservoirs, as defined in the *1990 Fort Hall Indian Water Rights Agreement* and decreed in the Snake River Basin Adjudication. Subject to Section 1.f below, the Tribal Water Supply Bank water that will be available for the Rental Volume excludes all other water rights and water assets of the Tribes, and such water rights and assets are not a part of this Lease Agreement.

c. The Tribes and IGWA agree that the Tribes' obligation to deliver water under this Lease Agreement is contingent on the availability of water from the Tribal Water Supply Bank for rental. Each year, the Tribes will declare the quantity of water in the Tribal Water Supply Bank available as Rental Volume to IGWA within 5 business days of the Water District 1 publication date of storage allocation.

d. The quantity of water in the Tribal Water Supply Bank available as Rental Volume will be calculated by the Tribes as the Tribal Water Supply Bank storage allocation remaining after satisfaction of: (1) the estimated Michaud Unit irrigation demands, (2) an additional volume of storage water, not to exceed 5,000 acre-feet, to mitigate uncertainty, and (3) other lease contracts, separate from this Lease Agreement, entered into by the Tribes for use of the Tribal Water Supply Bank that carry a higher annual lease price as described in Section 1.e below. The quantity of available water may also be limited by court orders or other regulatory enforcement of applicable laws and regulations applicable to the Tribal Water Supply Bank water.

e. Nothing in this Lease Agreement shall operate to prevent the Tribes from leasing additional water from the Tribal Water Supply Bank to another party or parties. The total annual water supplies available to satisfy lease contracts from the Tribal Water Supply Bank will be determined as stated in Section 1.d above and allocated to each lease contract, which is active on the publication date of storage allocation, as follows: (1) the lease contract with the highest lease price ($/acre-foot) will be satisfied in full up to its annual contract volume, (2) the lease contract with the second-highest lease price will next be satisfied in full up to its annual contract volume, and (3) additional lease contracts will be satisfied in a similar fashion with priority for supply given to lease contracts based on lease prices. The allocation of annual supplies to active lease contracts does not apply to Carryover Volume and Additional Volume described below.

f. The Tribes hold a "**Reserve Supply**" equal to 25,276 acre-feet that was secured under a 2015 settlement agreement. The Tribes may request delivery of the Reserve Supply each year up to an annual volume of 10,000 acre-feet and the Reserve Supply is administered as Tribal storage allocation in American Falls Reservoir. Each year of this Lease Agreement, the Tribes, in their sole discretion, may elect to use the Reserve Supply to fulfill Rental Volume commitments defined in Section 1.a above. The Reserve Supply will be provided through the Tribal Water Supply Bank.

g. Subject to reservoir space being available in the Tribal Water Supply Bank and approval by the Tribes, IGWA may elect to hold and carryover a portion of the Rental Volume in storage and not take delivery of that carryover water in the same year that it was declared available by the Tribes. This volume of water is referred to herein as "**Carryover Volume**". The Carryover Volume shall be accounted for as an independent volume of water within the Tribal Water Supply Bank, such that the annual Rental Volume calculation and other Tribal uses of its federal contract storage rights identified in Section 1.d shall not be drawn from the Carryover Volume. The Carryover Volume shall be annually reduced based on a pro-rata portion of the annual evaporative losses applied to the Tribal Water Supply Bank. The total Carryover Volume accumulated in previous years shall not exceed 10,000 acre-feet.

h. The Carryover Volume shall be reset to zero when the Tribal Water Supply Bank refills, indicated by a combined allocation of at least 128,000 acre-feet to the Tribes' federal contract storage rights in American Falls and Palisades Reservoirs. No repayment or reimbursement shall be due to IGWA for lost Carryover Volume due to a reset. The Carryover Volume shall reset to zero at the end of this Lease Agreement term, unless otherwise agreed to in a separate writing by the Parties.

i. IGWA will have the option to lease additional water from the Tribal Water Supply Bank, in excess of 25,000 acre-feet, if it is made available for rental by the Tribes. This volume of water is referred to herein as "**Additional Volume**". It is understood and acknowledged by IGWA and the Tribes that Additional Volume rentals may impact the availability of water as Rental Volume in future years. IGWA shall communicate to the Tribes an interest in leasing Additional Volume by April 1 of the year in which the Additional Volume is requested. The Tribes' approval of Additional Volume leases shall be at the sole discretion of the Tribes and shall not be subject to the calculations defined in Section 1.d.

2. Water Delivery and Administration. Delivery of the Rental Volume shall occur when the Rental Volume has been released from either Palisades or American Falls Reservoir, and appropriately deducted from the Tribes' storage account in these reservoirs. The Tribes and IGWA shall cooperatively work together to ensure the delivery of the Rental Volume to IGWA and the appropriate administration of such water.

a. The quantity of water to be leased under this Lease Agreement under Paragraph 1 has been reviewed by the Tribal Rental Pool Committee as required by the Shoshone-Bannock Tribal Water Supply Bank Rules.

b. Any carriage or other losses of Rental Volume that may occur downstream from American Falls Reservoir or Palisades Reservoir, as the source of water, shall be the responsibility of IGWA.

c. The scheduling of releases of the Rental Volume shall be in the sole discretion of IGWA, provided however, that IGWA will notify and cooperate with the Tribes and the U.S. Bureau of Reclamation (Reclamation) to implement any storage release request. The

Tribes and IGWA will cooperate with Reclamation and Water District 1 in measuring and accounting for the Rental Volume at the outflow of American Falls Reservoir and/or Palisades Reservoir.

d. The Rental Volume, Carryover Volume, and Additional Volume leases shall only be available for use by IGWA or assignment to the Surface Water Coalition to satisfy IGWA's obligations, and shall not otherwise be available for re-marketing or assignment to a third party, unless such re-marketing or assignment is agreed upon in writing by the Tribes.

3. Term. The term of this Lease Agreement shall be for five (5) years commencing on April 1, 2021 and terminating on October 31, 2025.

   a. After the initial term, the Lease Agreement will be automatically renewed on an annual basis, unless a termination letter is sent by the Tribes or IGWA six (6) months prior to the desired termination date of the Lease Agreement.

4. Agreement Contingencies. This Lease Agreement, and obligations hereunder, are expressly contingent upon:

   a. Acquiring all approvals that may be required for the rental, release, delivery, and use of the Rental Volume by IGWA;

   b. Payment by IGWA pursuant to Paragraph 5 below;

   c. Delivery of the Rental Volume by the Tribes to IGWA prior to October 31 of each year during the term of this agreement, subject to the provisions of Paragraphs 5-7 below.

5. Payment. The "**Annual Lease Payment**" shall be calculated as the Rental Volume declared and made available for lease by the Tribes multiplied by the Lease Price. The Lease Price during the 5-year term shall be calculated as follows:

Year	Lease Price Adjustment ($/acre-foot)	Lease Price ($/acre-foot)
2021	$0	$[redacted]
2022	Maximum of $1 per acre-foot or % change in Consumer Price Index for All Urban Consumer (CPI) from January 1, 2021 to December 31, 2021 multiplied by the 2021 Lease Price, rounded to the nearest dollar.	2021 Lease Price + 2022 Adjustment
2023	Maximum of $1 per acre-foot or % change in CPI from 1/1/2022 to 12/31/2022 multiplied by the 2022 Lease Price, rounded to the nearest dollar	2022 Lease Price + 2023 Adjustment
2024	Maximum of $1 per acre-foot or % change in CPI from 1/1/2023 to 12/31/2023 multiplied by the 2023 Lease Price, rounded to the nearest dollar	2023 Lease Price + 2024 Adjustment
2025	Maximum of $1 per acre-foot or % change in CPI from 1/1/2024 to 12/31/2024 multiplied by the 2024 Lease Price, rounded to the nearest dollar	2024 Lease Price + 2025 Adjustment

a. If the full Rental Volume is not available in any particular year, IGWA shall pay the dollar per acre-foot Lease Price stated above for that year for the Rental Volume available.

b. IGWA shall be obligated to make the Annual Lease Payment each year whether or not IGWA takes delivery of any amount of the Rental Volume by October 31 of each year.

c. IGWA shall make payments for the Carryover Volume in the year that the water is first declared available as Rental Volume by the Tribes, and shall not make a second payment for the water in subsequent years when it is delivered for use.

d. The annual lease price adjustment shown in the table above shall be applied in each subsequent year that the Lease Agreement is renewed under Section 3.a after the initial 5-year term.

e. Payments for Additional Volume leases shall be based on the lease price stated above for the year in which the Additional Volume lease takes place, and such payments shall represent an addition to the Annual Lease Payment due to the Tribes.

6. Payment Schedule. The lease payments shall be payable by IGWA as follows:

a. 50% of the total Annual Lease Payment is due by July 1 of each year of the Lease Agreement;

b. The balance of the total Annual Lease Payment is due by November 1 of each year of the Lease Agreement;

c. Payments for Additional Volume leases shall follow the payment schedule defined above for the Rental Volume leases.

d. All payments are payable by wire transfer to the Tribes within five (5) business days of due date stated above.

7. Termination. Either the Tribes or IGWA may terminate this Lease Agreement in accordance with the provisions below:

a. Either the Tribes or IGWA may terminate this Lease Agreement:

i. For any violation or breach of the terms of this Lease Agreement; or
ii. If any of the terms and conditions of any approval of the lease arrangement, or other applicable state or federal law, rule, or regulation, or the administration of the leased water, are inconsistent with the terms of this Lease Agreement.

b. Termination shall be effective within 30 days of provision of written notice to the other party detailing the basis for such termination. The party against whom such termination

is asserted shall have 30 days to cure the violation or breach that is the basis for the termination.

c. Termination may be subject to the Conflict Resolution provisions of Section 8.e, if the party against whom termination is sought disagrees with the basis of the termination.

d. In the event of any such termination, there shall be an accounting of lease payments paid by IGWA and leased water delivered by the Tribes as of the termination date. IGWA shall pay for all leased water delivered. In the event IGWA has submitted payment for leased water that remains undelivered by the termination date, the Tribes shall refund any lease payments received for leased water that remains undelivered, and the Tribes will not be obligated to provide such water unless the parties otherwise agree in writing.

8. Miscellaneous Provisions.

a. Amendments. No amendment or modification of this Lease Agreement or its provisions shall be effective unless documented in writing and approved and executed by all parties with the same formality as this Lease Agreement.

b. Force Majeure. Delays or inability to perform any of the requirements of this Lease Agreement within the term or time limits prescribed herein shall be excused to the extent that performance is rendered impossible by any event beyond the control of either party including but not limited to drought, governmental acts or orders or restrictions, existing legal obligations, failure of suppliers, war, terrorism or any other reason where failure to perform is beyond the reasonable control of and is not caused by the conduct of the non-performing party. A force majeure event shall not include financial inability to complete performance of an obligation.

c. Notices. All notices and other communications under this Lease Agreement shall be in writing. Notices shall be deemed as duly received on the date of service, if served personally on the party to whom notice is to be given. Notices shall also be deemed as duly received five (5) days from the date said notice is mailed to the party to whom notice is to be given, either by first class mail, registered or certified, postage prepaid or by express delivery with handling prepaid, and properly addressed as follows:

If to the Shoshone-Bannock Tribes:

Chairman, Fort Hall Business Council

d. Compliance with Laws and Usage. The Parties, at their own expense, will comply with all federal, state, and tribal laws, ordinances, rules, and regulations applicable to this Lease Agreement and the business conducted pursuant thereto.

e. Conflict Resolution. In the event of any dispute, claim, question, or disagreement arising from or relating to the Lease Agreement or the breach thereof, the Tribes and IGWA agree as follows:

   i. The Tribes and IGWA agree to initially submit such dispute to non-binding mediation in an effort to resolve the same.
   ii. In the event that formal legal proceedings are commenced in connection with this Agreement, the parties agree that the Shoshone-Bannock Tribal Court shall be the sole, proper and exclusive forum and venue for such proceedings.
   iii. The laws and regulations of the Shoshone-Bannock Tribes shall govern the interpretation of this Lease Agreement and/or any formal legal proceedings commenced regarding this Lease Agreement.

f. Attorneys' Fees. In any action concerning the terms or enforcement of this Lease Agreement, the prevailing party shall be entitled to recover reasonable costs and attorneys' fees, including any costs and attorneys' fees incurred in appellate proceedings.

g. Binding Effect. All of the covenants, conditions, and provisions of this Lease Agreement shall inure to the benefit of and be binding upon the parties hereto and their respective successors and assigns.

h. Entire Agreement. This Lease Agreement constitutes the entire agreement between the parties and supersedes any prior understandings or oral or written agreements between the parties respecting the within subject matter.

i. Severability. If any provision of this Lease Agreement shall ever be held to be invalid or unenforceable, such invalidity or unenforceability shall not affect any other provision of this Lease Agreement, but such other provisions shall continue in full force and effect.

j. Headings. The headings of paragraphs and sections in this Lease Agreement are inserted only as a matter of convenience and for reference purposes, and they do not define, limit, or describe the scope of this Lease Agreement or the intent of any of the provisions thereof.

k. Sovereign Immunity. Neither the execution of this Lease Agreement, nor any provision contained herein shall be interpreted to act as a waiver of the Shoshone-Bannock Tribes' sovereign immunity. The Shoshone-Bannock Tribes hereby specifically reserves and retains its sovereign immunity and any rights appurtenant thereto. The Shoshone-Bannock Tribes' sovereign immunity from suit may only be waived by resolution of the Fort Hall Business Council.

l. Contract Interpretation. The parties have participated jointly in the negotiation and drafting of this Lease Agreement. In the event an ambiguity or question of intent or interpretation arises, this Lease Agreement shall be construed as if drafted jointly by the parties and no presumption or burden of proof shall arise favoring or disfavoring any party by virtue of the authorship of any of the provisions of this Lease Agreement.

m. No Third Party Beneficiary. This Lease Agreement is exclusively for the benefit of and governs only the parties hereto. The Tribes and IGWA are the only parties to this Compact and are the only parties entitled to enforce the terms of this Lease Agreement. Nothing in this Lease Agreement gives, or is intended to give, or shall be construed to give or provide any benefit or right, whether directly, indirectly or otherwise, to third persons.

n. Indemnification. IGWA indemnifies the Tribes and its officers, subsidiaries, agents, and employees (the "Indemnitees") and IGWA shall hold the Indemnitees harmless for any damages, claims, demands, personal injury, illness, death, property damage, or other loss resulting in any manner in connection with IGWA's use of the water leased pursuant to this Lease Agreement.

o. No Waiver. Forbearance in enforcing any right or remedy under this Lease Agreement shall not be deemed a wavier nor shall it be the basis for an inference that any party hereto has waived any provision hereof or that a party has waived any right hereunder.

This Lease Agreement shall be signed in triplicate and shall be effective when signed by both the Tribes and IGWA.

STORAGE WATER LEASE
This Storage Water Lease ("Agreement") is entered into between North Fork Reservoir Company, ("Lessor"), and Henry's Fork Groundwater District (the "District").
RECITALS

A. Lessor has the right to use, lease, and assign storage water allocated and available to Lessor as a space holder in the Idaho Water District 1 reservoir system pursuant to Lessor's Storage Water Contracts with the United States Bureau of Reclamation ("Reclamation").

B. THE DISTRICT desires to lease storage water to satisfy mitigation obligations determined by the Director of the Idaho Department of Water Resources ("Department") and related purposes, such as aquifer recharge and converting farmland from ground to surface water irrigation.

C. Lessor desires to lease storage water to the DISTRICT, and the DISTRICT desires to lease storage water from Lessor, pursuant to the terms of this Lease.

LEASE

1. Storage Water Lease. Lessor hereby leases to the DISTRICT storage water for 2021-2025 only, at which the DISTRICT is required to pay rent as follows:

1,500 acre-feet at $20.00 per acre-foot. IGWA will pay $1.30 acre-foot Water District 01 administrative fee and $2.00 State Water Supply Bank Fee for a total payment of $3.30 per acre-foot.
2. Term. The initial term of this Lease shall commence March 13, 2021, and end November 30, 2025.

3. Payment of Rent. The DISTRICT will pay the rent to Lessor in one installment, on or before 1st day October, of each year.

4. Administrative Fees. IGWA will pay all administrative fees imposed by Water District 1 and the Idaho Water Resource Board.

5. Use of Leased Water.

5.1 The assignment, delivery, and use of leased storage water will be determined by the DISTRICT and is subject to the final accounting for the year by the Water-master of Water District 1 and any applicable Water District 1 Rental Pool Rules.
5.2 This Lease does not include any right to use storage water below Milner Dam.
5.3 The storage water available to the DISTRICT under this Lease may be assigned and delivered by the DISTRICT to any of its members or to any other person or entity for the authorized uses of recharge, mitigation, irrigation, or other lawful use at any time up to December 1 each year.
5.4 Any storage water not used or assigned by the DISTRICT by December 1 shall remain in Lessor's Water District 1 storage account and then belong only to Lessor.
5.5 Lessor understands that any storage water leased may be subject to the Water District 1 Rental Pool Rules.

6. Representations by Lessor. Lessor covenants and represents that:

6.1 It will provide to the DISTRICT all storage water leased under this Lease.
6.2 It is the true and lawful owner of the storage water and that nothing restricts or precludes Lessor from entering this Lease.

7. Breach. If either party defaults in the performance of its obligations under this Lease, and such default is not cured within thirty (30) days after receipt of written notice thereof, the non-breaching party, at its option, may elect any or all of the following cumulative remedies:

(a) Terminate this Lease.
(b) Seek specific performance of this Lease;

8. Assignment. This Lease may not be assigned by the DISTRICT without the express written consent of Lessor, but the storage water leased by the DISTRICT under this Lease may be assigned or otherwise made available to any other person or entity.

9. Dispute Resolution. Any substantial dispute between the parties shall be resolved in accordance with the following provisions.

9.1 Good Faith Negotiation. Upon written notice from one party to the other, authorized representatives of the parties will attempt in good faith to resolve the dispute by negotiation.
9.2 Mediation. If the dispute cannot be resolved by good faith negotiation, either party may demand that the dispute be subjected to mediation by a mediator designated by mutual Lease of the parties. The mediation will be held in **Fremont** County, Idaho, unless the parties mutually agree to a different location. Mediator costs will be split equally between the parties.
9.3 Litigation. Litigation is allowed between the parties only: (i) if the dispute is not resolved by mediation, (ii) for the purpose of enforcing a settlement Lease entered into between the parties, or (iii) to seek temporary injunctive relief if a party deems such action necessary to avoid irreparable damage. The pursuit or granting of temporary injunctive relief does not excuse the parties from participating in good faith negotiation and mediation as set forth above. The prevailing party in any litigation is entitled to recover reasonable attorney fees and costs.
9.4 Governing Law, Jurisdiction, and Venue. This Lease will be construed and interpreted in accordance with the laws of the State of Idaho. The parties agree that the courts of Idaho shall have exclusive jurisdiction and agree that **Fremont** County is the proper venue.
9.5 Exclusive Procedures. The procedures specified in this section 9 are the exclusive procedures for the resolution of disputes between the parties. All applicable statutes of limitation shall be tolled while the negotiation and mediation procedures specified in section 9.1 and 9.2 are pending.

10. Notices. All notices given pursuant to this Lease must be in writing and shall be sent in one of the following manners: (a) by certified mail, return receipt requested, postage prepaid; (b) by recognized overnight courier such as Federal Express; (c) by facsimile transmission; (d) by email if the receiving party acknowledges receipt of the emailed notice. Notices shall be deemed received on the earlier of actual receipt, three days after mailing

for certified mail and regular mail, the next business day if given by fax, or the date the receiving party acknowledges receipt of email notice.

ADDRESSES TO BE USED FOR NOTICES AND DELIVERY OF LEASE PAYMENTS SHALL BE AS FOLLOWS:
Lessor: North Fork Reservoir Company
Michael Rasmussen, President
Address: PO Box 250
Rexburg, Idaho 83201

DISTRICT: Henry's Fork Groundwater District
Aaron Dalling, Secretary
Address: PO BOX 15 St. Anthony, Idaho 83445
Phone: 208-403-8474
Email: aaron.fmid@myidahomail.com
Either party may change its designated address by providing written notice of such change to the other party.

11. Binding Effect. This Agreement shall be binding upon the respective heirs, successors, and assigns of the parties.

DATED this 26 day of Aug 2022.

ONE-YEAR TRIBAL WATER LEASE AGREEMENT

This One-Year Tribal Water Lease Agreement ("Lease Agreement") is entered into between the SHOSHONE-BANNOCK TRIBES of the Fort Hall Reservation ("Tribes"), acting through the Tribal Lease Pool Committee in the operation of the Tribal Water Supply Bank and the Fort Hall Business Council, and the following three groundwater districts: North Snake Ground Water District, Magic Valley Ground Water District, and American Falls-Aberdeen Ground Water District (collectively, "Districts"). The Tribes and Districts may be referred to herein collectively as the "parties" and individually as a "party." This Lease Agreement shall be effective on the date executed by both parties.

RECITALS

A. Pursuant to *The 1990 Fort Hall Indian Water Rights Agreement*, the Tribes are entitled to federal storage contract rights, held in trust for the Tribes by the United States, in an amount of 2.8059% of the storage space in American Falls Reservoir and 6.9917% of the storage space in Palisades Reservoir. These contract storage rights are equivalent to full capacity volumes of 46,931 acre-feet in American Falls Reservoir and 83,900 acre-feet in Palisades Reservoir. These water rights and associated volumes of storage water are referred to herein as the "Tribal Water Supply Bank." Due to sedimentation, the maximum annual volumes accrued to each of the contract storage rights are less than the stated capacity volumes.

B. The Shoshone-Bannock Tribes have adopted the Shoshone-Bannock Tribal Water Supply Bank Rules, which have been duly approved by the Idaho Water Resources Board, for the purposes of leasing storage water held by the Tribes in American Falls Reservoir for delivery and use in the Snake River Basin anywhere within Idaho, and for leasing storage water held by the Tribes in Palisades Reservoir for delivery and use in the Snake River Basin above Milner Dam.

C. The Districts are members of the Idaho Ground Water Appropriators, Inc. ("IGWA") which has entered into an agreement with the Surface Water Coalition to resolve disputes related to the impacts of groundwater use on surface water rights. The Districts desire to lease storage water from the Tribes based on the terms herein for use in meeting aspects of that agreement.

AGREEMENT

Now, therefore, and in consideration of the covenants and obligations set forth herein, and for other good and valuable consideration, the Tribes and Districts agree as follows:

1. **Leased Water.** The Tribes will provide to the Districts, and the Districts will rent from the Tribes, a volume of 10,000 acre-feet (the "Lease Volume"), subject to the following terms and conditions:

   1.1 The Lease Volume will be supplied from the Tribal Water Supply Bank. Water available for the Lease Volume excludes all other water rights and water assets of the Tribes, and such water rights and assets are not a part of this Lease Agreement.

   1.2 The Tribes hold a "Reserve Supply" equal to 25,276 acre-feet that was secured under a 2015 settlement agreement. The Tribes may request delivery of the Reserve Supply each year up to an annual volume of 10,000 acre-feet to be administered as Tribal storage allocation in American Falls Reservoir. The Tribes, in their sole discretion, may elect to use the Reserve Supply to fulfill Lease Volume commitment defined in Section 1 above. The Reserve Supply will be provided through the Tribal Water Supply Bank.

2. **Water Delivery and Administration.** Delivery of the Lease Volume shall occur when the Lease Volume has been released from either Palisades or American Falls Reservoir, and appropriately deducted from the Tribes' storage account in these reservoirs. The Tribes and Districts shall cooperatively work together to ensure the delivery of the Lease Volume to the Districts and the appropriate administration of such water.

   2.1 The quantity of water to be leased under this Lease Agreement under Paragraph 1 will be reviewed by the Tribal Rental Pool Committee as required by the Shoshone-Bannock Tribal Water Supply Bank Rules.

   2.2 Any carriage or other losses of Lease Volume that may occur downstream from American Falls Reservoir or Palisades Reservoir shall be the responsibility of the Districts.

   2.3 The scheduling of releases of the Lease Volume shall be in the sole discretion of the Districts; provided however, that the Districts will notify and cooperate with the Tribes and the U.S. Bureau of Reclamation (Reclamation) to implement any storage release request. The Tribes and Districts will cooperate with Reclamation and Water District 1 in measuring and accounting for the Lease Volume at the outflow of American Falls Reservoir and/or Palisades Reservoir.

   2.4 The Lease Volume shall only be available for use by the Districts or assignment to the Surface Water Coalition to satisfy IGWA's obligations and shall not otherwise be available for re-marketing or assignment to a third party, unless such re-marketing or assignment is agreed to in writing by the Tribes.

3. **Term.** The term of this Lease Agreement shall be for one (1) year commencing April 1, 2023, and terminating on October 31, 2023.

4. **Agreement Contingencies.** This Lease Agreement, and all obligations hereunder, are expressly contingent upon:

   4.1 Payment by the Districts pursuant to Section 5 below;

   4.2 Delivery of the Lease Volume by the Tribes to the Districts prior to October 31, 2023, subject to the provisions of Paragraphs 5-7 below.

5. **Payment.** The "Lease Payment" shall be [redacted]. The Districts shall be obligated to make the Lease Payment whether or not the Districts take delivery of any amount of the Lease Volume by October 31, 2023. Provided, however, that if the Tribes are unable to make available for delivery the full Lease Volume, the Districts shall pay [redacted] per acre foot of water the Tribes make available for delivery.

6. **Payment Schedule.** The Lease Payment shall be payable by the Districts as follows:

   6.1 50% of the Lease Payment is due by July 15, 2023;

   6.2 The balance of the Lease Payment is due by November 1, 2023;

   6.3 All payments are payable by wire transfer to the Tribes within five (5) business days of due date stated above.

7. **Termination.** Either the Tribes or the Districts may terminate this Lease Agreement in accordance with the provisions below:

   7.1 The Tribes or Districts may terminate this Lease Agreement:

   (a) For any uncured violation or breach of the terms of this Lease Agreement; or

   (b) If any of the terms and conditions of any approval of the lease arrangement, or other applicable state or federal law, rule, or regulation, or the administration of the leased water, are inconsistent with the terms of this Lease Agreement.

   7.2 Termination shall be effective within 30 days of provision of written notice to the other party detailing the basis for such termination. The party against whom such termination is asserted shall have 30 days to cure the violation or breach that is the basis for the termination.

   7.3 Termination may be subject to the Conflict Resolution provisions of Section 10 if the party against whom termination is sought disagrees with the basis of the termination.

   7.4 In the event of any such termination, there shall be an accounting of the Lease Payment paid by the Districts and the Lease Water delivered by the Tribes as of the termination date. The Districts shall pay for all Lease Water delivered. If the Districts have submitted payment for Lease Water that remains undelivered by the termination date, the Tribes shall refund the portion of the Lease Payment received for water that remains undelivered, and the Tribes will not be obligated to provide such water unless the parties otherwise agree in writing.

8. **Miscellaneous Provisions.**

   8.1 Amendments. No amendment or modification of this Lease Agreement or its provisions shall be effective unless documented in writing and approved and executed by all parties with the same formality as this Lease Agreement.

   8.2 Force Majeure. Delays or inability to perform any of the requirements of this Lease Agreement within the term or time limits prescribed herein shall be excused to the extent that performance is rendered impossible by any event beyond the control of either party including but not limited to drought, governmental acts or orders or restrictions, war, terrorism or any other reason where failure to perform is beyond the reasonable control of and is not caused by the conduct of the non-performing party. A force majeure event shall not include financial inability to complete performance of an obligation.

   8.3 Notices. All notices and other communications under this Lease Agreement shall be in writing. Notices shall be deemed as duly received on the date of service, if served personally on the party to whom notice is to be given. Notices sent by mail shall be deemed as duly received five (5) days from the date said notice is mailed to the party to whom notice is to be given, either by first class mail, registered or certified, postage prepaid or by express delivery with handling prepaid. Notices sent by email shall be deemed delivered when the intended recipient acknowledges receipt via reply email. Either party may change its address for notices by sending written notice to the other party in accordance herewith. Notices shall be addressed as follows:

Pocatello,ID 83204
(208) 232-6101
tj@racineolson.com

9. **Compliance with Laws and Usage.** The parties, at their own expense, will comply with all federal, state, and tribal laws, ordinances, rules, and regulations applicable to this Lease Agreement and the business conducted pursuant thereto.

10. **Conflict Resolution.** In the event of any dispute, claim, question, or disagreement arising from or relating to the Lease Agreement or the breach thereof, the Tribes and Districts agree as follows:

    (a) The parties will initially engage in good faith negotiation in an attempt to resolve the conflict cooperatively.

    (b) If the conflict is not resolved to the satisfaction of either party through good faith negotiation, the parties agree to submit such dispute to non-binding mediation in an effort to resolve the same.

    (c) If formal legal proceedings are commenced in connection with this Lease Agreement, the parties agree that the Shoshone-Bannock Tribal Court shall be the sole, proper, and exclusive forum and venue for such proceedings.

(d) The laws and regulations of the Shoshone-Bannock Tribes shall govern the interpretation of this Lease Agreement and/or any formal legal proceedings commenced regarding this Lease Agreement.

11. **Attorneys' Fees.** In any action concerning the interpretation or enforcement of this Lease Agreement, the prevailing party shall be entitled to recover reasonable costs and attorneys' fees and costs incurred, including any costs and attorneys' fees incurred in appellate proceedings.

12. **Binding Effect.** All of the covenants, conditions, and provisions of this Lease Agreement shall inure to the benefit of and be binding upon the parties hereto and their respective successors and assigns.

13. **Entire Agreement.** This Lease Agreement constitutes the entire agreement between the parties and supersedes any prior understandings or oral or written agreements between the parties respecting the subject matter hereof.

14. **Severability.** If any provision of this Lease Agreement is held to be invalid or unenforceable, such invalidity or unenforceability shall not affect any other provision of this Lease Agreement, and such other provisions shall continue in full force and effect, unless Sections 1, 5 or 6 are held to be invalid or unenforceable.

15. **Headings.** The headings of paragraphs and sections in this Lease Agreement are inserted only as a matter of convenience and for reference purposes, and they do not define, limit, or describe the scope of this Lease Agreement or the intent of any of the provisions thereof.

16. **Sovereign Immunity.** Neither the execution of this Lease Agreement, nor any provision contained herein shall be interpreted to act as a waiver of the Shoshone-Bannock Tribes' sovereign immunity. The Shoshone-Bannock Tribes hereby specifically reserves and retains its sovereign immunity and any rights appurtenant thereto. The Shoshone-Bannock Tribes' sovereign immunity from suit may only be waived by resolution of the Fort Hall Business Council.

17. **Contract Interpretation.** The parties have participated jointly in the negotiation and drafting of this Lease Agreement. If an ambiguity or question of intent or interpretation arises, this Lease Agreement shall be construed as if drafted jointly by the parties and no presumption or burden of proof shall arise favoring or disfavoring any party by virtue of the authorship of any of the provisions of this Lease Agreement.

18. **No Third-Party Beneficiary.** This Lease Agreement is exclusively for the benefit of and governs only the parties hereto. The Tribes and Districts are the only parties to this Lease Agreement and are the only parties entitled to enforce the terms of this Lease Agreement. Nothing in this Lease Agreement gives, or is intended to give, or shall be construed to give or provide any benefit or right, whether directly, indirectly or otherwise, to third persons.

19. **Indemnification.** The Districts indemnify the Tribes and its officers, subsidiaries, agents, and employees (the "Indemnitees") and the Districts shall hold the Indemnitees harmless for any damages, claims, demands, personal injury, illness, death, property damage, or other loss resulting in any manner in connection with the Districts' use of the water leased pursuant to this Lease Agreement.

20. **No Waiver.** Forbearance in enforcing any right or remedy under this Lease Agreement shall not be deemed a wavier nor shall it be the basis for an inference that any party hereto has waived any provision hereof or that a party has waived any right hereunder.

RESOLUTION

WHEREAS, the Fort Hall Business Council has the ultimate responsibility for budget approvals and overseeing the administration of all Tribal funding as well as those funds awarded to the Shoshone-Bannock Tribes through contracts, grants and cooperative agreements, regardless of the source; and

WHEREAS, the Tribal Water Bank was established for the benefit of the Shoshone-Bannock Tribes, pursuant to the "1990 Fort Hall Indian Water Rights Agreement", that utilizes the Tribes' contract storage rights in the American Falls and Palisades Reservoirs; and

WHEREAS, in 2015 the Tribes negotiated a Settlement Agreement for 25,276 acre-feet of storage water with the Committee of Nine for impacts that the Water District 01 Common Rental Pool had to the Tribes' storage supplies, of which 15,276 acre-feet is available and 10,000 acre-feet can be used annually; and

WHEREAS, three water districts: North Snake Ground Water District, Magic Valley Ground Water District and the American Falls-Aberdeen Ground Water District (Districts) have applied to rent 10,000 acre-feet of storage water for one-year from the Tribal Water Bank; and

WHEREAS, the Tribes have an adequate supply for 2023 to provide an additional 10,000 acre-feet of storage water; and

WHEREAS, the Tribal Water Resources Department (TWRD) is recommending that the Tribes' enter into a one-year Tribal lease agreement with the Districts for 10,000-acre feet; now

THEREFORE, BE IT RESOLVED BY THE BUSINESS COUNCIL OF THE SHOHONE-BANNOCK TRIBES, that the Tribal Water Resources Department is hereby approved to enter into one-year Tribal lease agreement with the North Snake Ground Water District, Magic Valley Ground Water District and the American Falls-Aberdeen Ground Water District for a 10,000 acre-feet at a rate of [redacted] dollars per acre-feet; and

BE IT FURTHER RESOLVED, that monies derived from this one-year Tribal lease agreement will be utilized to assist with costs associated with monitoring programs, water projects and TWRD costs towards the implementation and administration of the "1990 Fort Hall Indian Water Rights Agreement"; and

BE IT FURTHER RESOLVED, that the Tribal Chairman or official designee is authorized to sign the one-year Tribal lease agreement between the Tribes and the water districts: North Snake Ground Water District, Magic Valley Ground Water District, and the American Falls-Aberdeen Ground Water District; and

BE IT FURTHER RESOLVED, that the Interim TWRD Director is authorized to sign a letter to Water District 01 and Committee of Nine stating that the Tribes are electing to use 10,000 acre-feet of Settlement Water for 2023, if necessary.

Authority for the foregoing resolution is found in the Indian Reorganization Act of June 18, 1934 (48 Stat., 984), as amended, and in the Shoshone-Bannock Tribes Constitution and Bylaws of the Fort Hall Reservation, as amended, including, but not limited to the authority found in the Constitution, Article VI.

Dated this 31st day of January 2023

Nathan Small, Chairman
Fort Hall Business Council

S E A L

CERTIFICATION

I HEREBY CERTIFY, that the foregoing resolution was passed while a quorum of the Business Council was present by a vote of 5 in favor, 1 absent (DKT) and 1 not voting (NS) on the date this bears.

Claudia J. Washakie, Tribal Secretary
Fort Hall Business Council

Attorneys for Idaho Ground Water Appropriators, Inc.

STATE OF IDAHO

DEPARTMENT OF WATER RESOURCES

IN THE MATTER OF THE DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY AND FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **IGWA's Amended Witness and Exhibit Lists**

Idaho Ground Water Appropriators, Inc., ("IGWA"), acting for and on behalf of North Snake Ground Water District, Magic Valley Ground Water District, Carey Valley Ground Water District, American Falls-Aberdeen Ground Water District, Jefferson-Clark Ground Water District, Madison Ground Water District, and Henry's Fork Ground Water District, submits the following witness and amended exhibit lists.

WITNESSES

1. **Sofia Sigstedt.** Sofia Sigstedt is expected to testify as to her expert report, technical aspects of the Fifth Methodology Order and the April 2023 As-Applied Order, communications with the Department's technical working group, and other matters involving the Fifth Methodology Order and the April 2023 As-Applied Order.

2. **Jaxon Higgs.** Jaxon Higgs intended to testify as to his expert report, the proportionate mitigation obligations of IGWA's member ground water districts under the April 2023 As-Applied Order, irrigated acreage within Twin Falls Canal Company, conveyance efficiency of Twin Falls Canal Company, and other matters involving the Fifth Methodology Order and the April 2023 As-Applied Order. Mr. Higgs is not able to participate in the hearing scheduled June 6-10, 2023, due to a previously scheduled

family vacation out of the country.

3. **Mathew Weaver.** Mathew Weaver is expected to testify regarding information considered by Department personnel in developing the Fifth Methodology Order and the April 2023 As-Applied Order, the Department's application of the futile call doctrine, and other matters involving the Fifth Methodology Order and the April 2023 As-Applied Order.

4. **Tony Olenichak.** Tony Olenichak is expected to testify regarding the Department's distribution of water to members of the Surface Water Coalition and the Department's application of the futile call doctrine.

5. **Jennifer Sukow.** Jennifer Sukow is expected to testify regarding information considered and technical analyses performed by Department personnel in developing the Fifth Methodology Order and the April 2023 As-Applied Order.

6. **Matt Anders.** Matt Anders is expected to testify regarding information considered and technical analyses performed by Department personnel in developing the Fifth Methodology Order and the April 2023 As-Applied Order.

7. **Kara Ferguson.** Kara Ferguson is expected to testify regarding information considered and technical analyses performed by Department personnel in developing the Fifth Methodology Order and the April 2023 As-Applied Order.

8. **Other Department Staff.** IGWA reserves the right to call any other Department staff having information considered and technical analyses performed in connection with the development of the Fifth Methodology Order and the April 2023 As-Applied Order.

9. **Jay Barlogi.** Jay Barlogi is expected to testify regarding Twin Falls Canal Company's water delivery system, conveyance efficiencies, hydropower plants served by the Company's delivery system, Company policies, and others matters involving the Company.

10. **Lynn Carlquist.** Lynn Carlquist is expected to testify regarding the consequences for IGWA member districts and their patrons of the Fifth Methodology Order and the April 2023 As-Applied Order, and other matters involving the administration of water rights under the SWC delivery call related to the Fifth Methodology Order and the April 2023 As-Applied Order.

11. **Tim Deeg.** Tim Deeg is expected to testify regarding the consequences for IGWA member districts and their patrons due to the decisions contained within the Fifth Methodology Order and the April 2023 As-Applied Order, and other matters involving the administration of water rights under the SWC delivery call related to the Fifth Methodology Order and the April 2023 As-Applied Order.

12. **Kirk Jacobs.** Kirk Jacobs is expected to testify regarding the consequences for IGWA member districts and their patrons due to the decisions contained within the Fifth Methodology Order and the April 2023 As-Applied Order, and other matters involving the administration of water rights under the SWC delivery call related to the Fifth

Methodology Order and the April 2023 As-Applied Order.

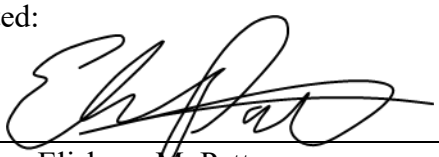
13. Any witness identified by any other party.

14. Any witness needed to authenticate any exhibit.

15. Any witness needed for rebuttal purposes.

EXHIBITS

Attached herewith as ***Appendix A*** is IGWA's **Amended** Exhibit List and the Common Exhibit List. Attached herewith as ***Appendix B*** is IGWA's Amended Exhibit List and Common Exhibits, with changes between IGWA's original exhibit list marked. In addition, IGWA reserves the right to utilize as exhibits (a) any document listed in the exhibit list of any other party to this proceeding; (b) water right records kept by the Department in its ordinary course of business; (c) any exhibit, pleading, or order filed previously with the Department in this matter; (d) transcripts of testimony proffered previously in this matter; (e) exhibits created for illustrative purposes; (f) exhibits utilized for rebuttal purposes; (g) subsequently disclosed exhibits for which the Director approves late disclosure; and (h) documents of which the Director takes official notice per IDAPA 30.01.01.602.



DATED this 2nd day of June, 2023.

Attorneys for American Falls Reservoir District #2 and Minidoka Irrigation District

BEFORE THE DEPARTMENT OF WATER RESOUCES

OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **SURFACE WATER COALITION'S RESPONSE TO IGWA'S AMENDED NOTICE OF MITIGATION**

COME NOW, A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, and TWIN FALLS CANAL COMPANY ("Surface Water Coalition" or "Coalition"), by and through counsel of record, and hereby submits the following response to *IGWA's Amended Notice of*

Mitigation.

On June 1, 2023, the Idaho Ground Water Appropriators, Inc. ("IGWA), acting on behalf of its member Ground Water Districts ("Districts") filed an amended notice ("Notice") that claims to provide "notice that the Districts can mitigate for their proportionate share of the demand shortfall predicted in the *Final Order Regarding April forecast Supply (Methodology Step 1-3)("April 2023 As-Applied Order")* issued April 21, 2023, in this matter." IGWA claims that it has 77,714 acre-feet of storage water rented that can be used for mitigation. The Coalition submits that the Notice is deficient and does not provide adequate notice of mitigation for the 2023 irrigation season.

IGWA is attempting to mitigate using the mitigation plan it refers to the "Storage Water Plan." In an earlier attempt to demonstrate mitigation through the Storage Water Plan, the Director held "the plan clearly states that IGWA will mitigate for all ground water users, not just its members and non-member participants." *See Order Determining Deficiency in IGWA's Notice of Secured Water* at 3. Despite this finding issued on May 23, 2023, IGWA claims that it is only mitigating for its "proportionate share of the demand shortfall", see Notice at 1, and "[t]he *April 2023 As-Applied Order* states that IGWA's share of the total predicted demand shortfall of 75,200 acre-feet is 63,645 acre feet." *See* Notice at 3. IGWA's Notice creates uncertainty concerning the amount of water it proposes to provide – is it 75,200 acre-feet as would be required by the Storage Water Plan or what IGWA determines to be its proportionate share of 75,200 acre-feet - 63,645 acre-feet?

Further, the Notice does not address all of IGWA's storage water mitigation obligations for 2023. The Director found that IGWA breached the mitigation plan IGWA refers to as the "Settlement Agreement Plan" in 2021, and to prevent curtailment in 2022, the Coalition and

IGWA entered into a Settlement Agreement in which IGWA promised to advise the Coalition of its ability to deliver 30,000 acre-feet of storage by April 1, 2023. IGWA has not done so. If IGWA wants to rely on the Storage Water Plan to mitigate its storage water obligations in 2023, it must demonstrate that it can rent the injury amounts of 75,200 acre-feet plus 30,000 acre-feet for a total of 105,200 acre-feet. It has not done so, and it is not entitled to the protections provided by the mitigation orders.

By attempting to mitigate pursuant to the Storage Water Plan, if IGWA believes or hopes that its 2023 obligation will be reduced by the next step Order under the Methodology, and if IGWA does not deliver 50,000 acre-feet required by the Settlement Agreement Plan, then IGWA is subjecting all of its Ground Water Districts, including those who are otherwise complying with the Settlement Agreement Plan, to a claim of breach of that Plan. If IGWA mitigates pursuant to the Settlement Agreement Plan, it is required to deliver 50,000 acre-feet of storage water. This amount and the additional 30,000 acre-feet required by the 2021 breach settlement totals 80,000 acre-feet. It is the Coalition's position that the minimum amount of storage water that is required to be delivered in 2023 in order to comply with IGWA's existing obligations is 80,000 acre-feet, and IGWA has not demonstrated that it can deliver that amount to date.

Finally, it is implied by IGWA's filing that it believes that can deliver storage water pursuant to the Storage Water Plan and that is all that is required to mitigate in 2023. Storage water is but one component of the Settlement Agreement Plan. The *Second Addendum to Settlement Agreement* dated December 14, 2016 and adopted by the Director in *that Final Order Approving Amendment to Stipulated Mitigation Plan* dated May 9, 2017, states that "Prior to April 1 annually the Districts will submit to the Steering Committee….their proposed actions to be taken for the upcoming irrigation season, together with supporting information compiled by

the Districts' consultants." IGWA has not done so, and therefore has not complied with its mitigation obligations for 2023.

IGWA has not demonstrated that it can comply with its existing 2023 mitigation obligations pursuant to either the Storage Water Plan or the Settlement Agreement Plan. Further, IGWA cannot rely solely on the delivery of storage water to satisfy its mitigation obligations – it must comply with the terms of the Settlement Agreement Plan and the 2021 Settlement Agreement. For all of the foregoing reasons the Coalition requests that the Director enter an order determining that IGWA's Amended Notice of Mitigation is deficient and does not comply with the orders of the Director.

DATED this 5th day of June, 2023.

Attorneys for American Falls Reservoir District #2 and Minidoka Irrigation District

BEFORE THE DEPARTMENT OF WATER RESOUCES

OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **SURFACE WATER COALITION'S MOTION TO LIMIT SCOPE OF HEARING**

COME NOW A&B Irrigation District, American Falls Reservoir District #2, Burley Irrigation District, Milner Irrigation District, Minidoka Irrigation District, North Side Canal Company, and Twin Falls Company (collectively hereafter referred to as the "Surface Water Coalition," "SWC," or "Coalition"), by and through counsel of record, hereby submit this Motion to Limit the Scope of Hearing pursuant to Department Rules of Procedure 220 (Motions) and 600 (Evidence). *See* IDAPA 37.01.01.220 and 600.

INTRODUCTION

After reviewing the various witness and exhibit lists filed by the parties last week, the Coalition files this *Motion to Limit the Scope of Hearing* for the upcoming hearing on the Director's *Fifth Amended Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* ("*Fifth Methodology Order*") and the *Final Order Regarding April 2023 Forecast Supply* ("*April As-Applied Order*") issued on April 21, 2023. The Coalition requests an order clarifying that the scope of issues to be raised at the hearing will be limited to the Department's updates in the Methodology Order, consideration of updated data, and the implementation of that methodology as set forth in the *April As-Applied Order*. Stated another way, this hearing should not be viewed as an opportunity to re-litigate the Coalition's delivery call and previously denied defenses, including the overall framework of the methodology that has been subject to a final judgment on the merits.

ARGUMENT

I. The Director Should Limit the Scope of the Administrative Hearing.

The parties have previously participated in: 1) a 2008 hearing regarding initial IDWR orders regarding the SWC delivery call and juniors' defenses thereto; 2) a 2010 hearing concerning additional data used in the methodology and whether the methodology was properly followed in the April As Applied Order; 3) district and supreme court judicial review of the 2008 case; *A&B Irr. Dist. et al. v. Spackman*, 155 Idaho 640 (2013); and 4) district court judicial review of the Director's first *Methodology Order* and other orders implementing the same; *Memorandum Decision and Order on Petitions for Judicial Review*, *IGWA et al. v. Spackman*, Gooding County Dist. Ct., Fifth Jud. Dist., Consolidated Case No. CV-2010-382 (Sept. 26,

2014).[1] *See* **Ex. A**. In other words, the fundamental aspects and merits of the Coalition's call have already been litigated. Consequently, the Director should limit the scope of this hearing so that it does not turn into an overly broad proceeding that attempts to readdress issues already decided on judicial review.[2] The Director is authorized to preclude testimony and evidence that is irrelevant, unduly repetitious, or unnecessary if it is already part of the overall case record. *See* Rule 600 ("The presiding officer, with or without objection, may exclude evidence that is irrelevant, unduly repetitious, inadmissible on constitutional or statutory grounds, or on the basis of any evidentiary privilege provided by statute, rule or recognized in the courts of Idaho."). Further, as evidenced by recent court filings, certain parties may continue with their efforts to broaden the scope of inquiry beyond what the Director has already authorized. *See Notice of Materials Department Witnesses May Rely Upon at Hearing and Intent to Take Official Notice* (identifying IDWR witnesses and topics they may testify about); *Order Limiting Scope of Depositions* at 4 ("the deposition process is not an opportunity for parties to question Department employees about the Director's deliberative process related to legal and policy considerations") (the same reasoning should apply to testimony by IDWR staff at the hearing).

To that end the Director should also deny the motion to subpoena witnesses and evidence beyond the scope of this proceeding. *See Motion for Director to Issue Subpoenas* (June 1, 2023). Since neither Mr. Weaver or Mr. Olenichak have been identified as Department witnesses in

[1] No party appealed the district court's decision and final judgment. Any individual parties that did not participate in these prior proceedings were provided with an opportunity to appear or participate.

[2] Amalgamated Sugar Co. and McCain Foods USA, Inc. also appear intent on expanding the scope of the hearing to mitigation and process issues not relevant to the *Fifth Methodology Order* and *April As Applied Order*. *See Amalgamated Sugar Company's Identification of Witnesses and Exhibits* at 2 ("Mr. Delorey may testify about Amalgamated's water rights, its effort to try and mitigate and its option for mitigation, including the process imposed in the above captioned matter"); *McCain Foods USA, Inc.'s Identification of Witnesses and Exhibits* at 2 ("Mr. King may testify about McCain's water rights, its effort to mitigate and its options for mitigation . . . the process and timelines and the timelines and process imposed in the above captioned matter.").

Director's May 5, 2023 *Notice*, the requests for subpoenas go beyond the scope of information and witnesess relevant to this proceeding. The Director has previously limited the scope of such hearings in this proceeding to ensure efficiency and preclude repetitive or irrelevant evidence. *See Order Limiting Scope of Evidence and Offering Witnesses (Methodology Order)* (May 21, 2010); *Order Limiting Hearing Evidence and Offering Witnesses* (May 21, 2010).[3] For the same reasons the Director should deny the Ground Water Users' requests to subpoena Deputy Directro Mat Weaver and Water District 01 Watermaster Tony Olenichak for the hearing, as well as their attempt to call Kara Ferguson and "Other Department Staff."

In addition, the Director should deny any attempts to expand the scope of this hearing to address issues that have already been litigated. For example, it appears the Ground Water Users will attempt to address a multitude of subjects that go beyond the updates to the *Fifth Methodology Order* and its implementation in the *April As Applied Order*. Bingham Ground Water District proposes to call a witness to address a "Southeastern Idaho Water Resources Management Impacts Surface-Groundwater Irrigation Demands / A Policy White Paper Review" regarding claimed economic impacts from curtailment. IGWA previously submitted economic information as part of the 2008 hearing. Subsequent to the hearing the Idaho Supreme Court issued the following decision that addresses economic issues in water right administration:

> The Groundwater Users' argument that full economic development means that priority of right is taken into consideration in managing the Aquifer only as necessary to prevent over-drafting of the Aquifer is not consistent with Idaho law. It would, in essence, preclude conjunctive management of the Aquifer. . . . As we held in *Musser v. Higginson*, 125 Idaho 392, 871 P.2d 809 (1994), hydrologically connected surface and ground waters must be managed conjuctively.
>
> * * *

[3] In those orders the Director denied IGWA's and Pocatello's attempts to call Lyle Swank, Tony Olenichak, Allan Wylie, and Liz Cresto on the hearing on the 2008 data for the Methodology Order as well as Lyle Swank and Tony Olenichak on the 2010 April As Applied Order.

> The policy of securing the maximum use and benefit, and least wasteful use, of the State's water resources applies to both surface and underground waters, and it requires that they be managed conjunctively.
>
> * * *
>
> The Rule requires impact upon the exercise of a water right. It does not require showing an impact on the profitability of the senior appropriator's business. Such a holding would conflict with Artcie XV, § 3 of the Idaho Constitution, which states that "[p]riority of appropriation shall give the better right as between those using the water." It would also require the Director or watermaster to examine the businesses of the senior and junior appropriators to determine which one could make the greater profit from the use of the water when there is a shortage. If business profitability was the basis for appropriation, decreed water rights would become meaningless. The issue would be which appropriator at the time could make the greater profit by using the water.

See Clear Springs Foods, Inc. v. Spackman, 150 Idaho 790, 808, 810, 252 P.3d 71, 89, 91 (2011).

In addition, certain parties apparently seek to re-litigate the methodology itself. *See e.g., Pocatello's Statement of Issues* at 2 (issues d, e, h, i, j, l, and m); *BJGWD Statement of Issues* at 2-3 (1, 2, 4, 11, 12, 13); *Coalition of Cities' Statement of Issues* at 2-3 (4, 7, 8, 9, 10, 11, 14); *City of Idaho Falls Statement of Issues* at 2-3 (2, 3, 4, 7, 8, 9, 10, 11, 12, 13). Again, the parties already fully litigated issues regarding the determination of material injury in the SWC call. The parties also challenged the Director's methodology on judicial review in consolidated case CV-2010-382. Judge Wildman issued a final order and judgment that was not appealed. *See* **Ex. A**. The hearing on the updates to the *Fifth Methodology Order* and implementation in the *April As Applied Order* is not a forum to re-litigate those issues.

Finally, certain parties attack the validity and use of ESPAM 2.2 in the Director's methodology and its implementation. Although the transient use for identifying a curtailment date in the update to the *Fifth Methodology Order* is a subject that will be addressed in this hearing, the use and science behind the groundwater model was fully addressed in the 2008

hearing. The Hearing Officer adopted the use of the model in this case and that decision was not overturned on judicial review:

> **9. It was appropriate to use the ESPAM in making the conjunctive management decisions in this case.** The ESPAM versions used by the former Director were the best science available. Decisions had to be made and will have to be made. The limitations of the model are identifiable and important, but they do not preclude reliance upon it. It has an acceptable level of reliability based on peer reviewed science.
>
> **10. As improvements are made that lead to a more reliable model those results should be utilized.** Doubtless the science of the relationship between the Snake River and the aquifer has not been exhausted. If study and application of the model leads to refinements or revelations, those improvements should be applied as they occur.

Opinion Constituting Findings of Fact, Conclusions of Law and Recommendation at 33-34 (emphasis in original).[4]

As such, any issues and proposed testimony and evidence that go beyond the updates to the *Fifth Methodology* and whether the Director properly applied the methodology in *April As Applied Order* should be excluded. The Director properly limited the scope of similar hearings and there is no reason to deviate from that reasoning at this time. Moreover, as explained further below, the parties are barred from relitigating such issues by the doctrine of *res judicata* because they have been previously litigated to a final judgment that cannot be undone through this hearing.

Res judicata is comprised of claim preclusion (true *res judicata*) and issue preclusion (collateral estoppel). *See Waller v. State, Dep't of Health & Welfare*, 146 Idaho 234, 237, 192 P.3d 1058, 1061 (2008). Issue preclusion protects litigants from litigating an identical issue with the same party or its privy. *See id*., (quoting *Ticor Title Co*., 144 Idaho at 123, 157 P.3d at 617).

[4] The ESPAM was also upheld by the Idaho Supreme Court in the Spring Users' delivery call appeal. *See Clear Springs Foods, Inc.*, 150 Idaho at 813-14; 252 P.3d at 94-95 ("[Groundwater Users] have failed to show that the Director abused his discretion in relying upon the model. . . . The district court did not err in upholding the Director's reliance upon the model").

The general rule is that once a judgment is entered it is *res judicata* with respect to all issues which were or could have been litigated. *Id*., (citing *Compton v. Compton*, 101 Idaho 328, 333, 612 P.2d 1175, 1180 (1980)). Five factors are required for collateral estoppel to bar re-litigation of an issue decided in an earlier proceeding:

> (1) the party against whom the earlier decision was asserted had a full and fair opportunity to litigate the issue decided in the earlier case; (2) the issue decided in the prior litigation was identical to the issue presented in the present action; (3) the issue sought to be precluded was actually decided in the prior litigation; (4) there was a final judgment on the merits in the prior litigation; and (5) the party against whom the issue is asserted was a party or in privity with a party to the litigation.

Id., (citing *Ticor Title Co*., 144 Idaho at 124, 157 P.3d at 618).

Applying those factors to the matter at hand, (1) the parties actively (or had a full and fair opportunity to) litigate these issues in the first hearing case and appeal (Case No. CV-2009-551) as well as the consolidated appeals in case no. CV-2010-382 which resolved challenges to the original Methodology Order in the *Memorandum Decision and Order on Petitions for Judicial Review* (Sept. 26, 2014); (2) the issues previously decided are identical to many of those raised in the Statements of Issues; (3) those issues were decided in the prior appeal, *A&B Irr. Dist.*, 155 Idaho 640; or the District Court's 2014 decision and final judgment; and (5) the groundwater entities were party to the previous litigation or were in privity with a party or parties to the litigation. Certainly the agency and the parties do not have to re-address the Coalition's delivery call and defenses as if the prior cases never existed. Yet that is the result of what the Ground Water Users' seek by listing various issues beyond the scope of the *Fifth Methodology Order* and the *April As Applied Order*.

Whereas IGWA's counsel estimated that this hearing could cost the parties' between $200,000 and $300,000 at last week's court hearing, allowing irrelevant testimony and evidence

beyond the proper scope of the hearing to take up unnecessary time and effort would only add to that potential expense, further burdening the agency and the parties.

CONCLUSION

For the reasons set forth above, the Director should issue an Order Limiting the Scope of Hearing. The issues that go beyond the Director's prior notice or that were raised and previously litigated should not be raised and argued at the hearing because they are barred by the doctrine of *res judicata*.

I.

STATEMENT OF THE CASE

A. Nature of the Case.

This matter involves a dispute between senior surface water users and junior ground water users over the conjunctive administration of water in the Snake River Basin. The dispute arises in the context of a delivery call initiated by the A&B Irrigation District, American Falls Reservoir District No. 2, Burley Irrigation District, Milner Irrigation District, Minidoka Irrigation District, North Side Canal Company and Twin Falls Canal Company (collectively, "Coalition" or "SWC") against certain junior ground water rights located in the Eastern Snake Plain Aquifer ("ESPA"). At issue is the methodology utilized by the Director of the Idaho Department of Water Resources ("Department") for determining material injury to reasonable in-

season demand and reasonable carryover to Coalition members, and his subsequent application of that methodology. The Coalition, Idaho Ground Water Appropriators, Inc. ("IGWA") and the City of Pocatello seek judicial review of the Director's methodology and his application of that methodology. Those parties ask this Court to set aside and remand various aspects of the Director's final orders.

B. Course of proceedings and statement of facts.[1]

1. This judicial review proceeding involves a number of *Petitions for Judicial Review*. They seek review of a series of final orders issued by the Director in relation to the Coalition's delivery call. What follows is a recitation of those final orders, the resulting *Petitions for Judicial Review*, and the subsequent proceedings on those *Petitions* before this Court.

2. On June 23, 2010, the Director issued his *Second Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* ("*Methodology Order*"). 382 R., pp.564-604. *Petitions* seeking judicial review of the *Methodology Order* were filed by the Coalition in Gooding County Case No. CV-2010-384, IGWA in Gooding County Case No. CV-2010-383, and the City of Pocatello in Gooding County Case No. CV-2010-388.

3. On June 24, 2010, the Director issued his *Final Order Regarding April 2010 Forecast Supply (Methodology Steps 3 & 4); Order on Reconsideration* ("*As-Applied Order*"). 382 R., pp.605-625. *Petitions* seeking judicial review of the *As-Applied Order* were filed by the Coalition in Twin Falls County Case No. CV-2010-3403, IGWA in Gooding County Case No. CV-2010-382, and the City of Pocatello in Gooding County Case No. CV-2010-387.

4. The six *Petitions for Judicial Review* previously mentioned were reassigned to this Court.[2]

---

[1] **Footnote Re: Citations to Agency Record.** The agency record in this proceeding consists of two subparts: (1) the previously-compiled record for the judicial review proceeding under Gooding County Case No. CV-2008-551, and (2) the more recently compiled record for the judicial review petitions consolidated under Gooding County Case No. CV-2010-382. For clarity and convenience, citations of the former record will use form "551 R., p. ___," while citations to the latter record will use the form "382 R., p.___."

[2] The reassignments were made pursuant to the Idaho Supreme Court's *Administrative Order* dated December 9, 2009, issued *In the Matter of the Appointment of the SBRA District Court to Hear All Petitions for Judicial Review from the Department of Water Resources Involving Administration of Water Rights.*

5. On July 29, 2010, pursuant to the unopposed request of the parties, the Court entered an *Order* consolidating the six *Petitions for Judicial Review* into Gooding County Case No. CV-2010-382 ("Consolidated 382 Case").

6. On September 17, 2010, the Director issued his *Final Order Revising April 2010 Forecast Supply (Methodology Step 7)*. 382 R., pp.636-645. A *Petition* seeking judicial review of that *Final Order* was filed by the Coalition in Twin Falls County Case No. CV-2010-5520. The *Petition* was reassigned to this Court.

7. On November 30, 2010, the Director issued his *Final Order Establishing 2010 Reasonable Carryover (Methodology Step 9)*. 382 R., pp.684-692. A *Petition* seeking judicial review of that *Final Order* was filed by the Coalition in Twin Falls County Case No. CV-2010-5946. The *Petition* was reassigned to this Court.

8. On December 13, 2010, the Court issued an *Order* staying proceedings in the Consolidated 382 Case pending the Idaho Supreme Court's issuance of its written decision in Idaho Supreme Court Docket No. 38193-2010. The stay was entered pursuant to the request and agreement of the parties.

9. On January 3, 2011, pursuant to the unopposed request of the parties, the Court entered an *Order* consolidating the Coalition's *Petitions* in Twin Falls County Case Nos. CV-2010-5520 and 2010-5946 into consolidated the Consolidated 382 Case.

10. On April 13, 2012, the Director issued his *Final Order Regarding April 2012 Forecast Supply (Methodology Steps 1-8)*. 382 R., pp.728-742. On May 9, 2012, the Director issued his *Order Denying Petition for Reconsideration; Denying Motion to Authorize Discovery; Denying Request for Hearing (Methodology Steps 1-8)*. 382 R., pp.753-757. A *Petition* seeking judicial review of that *Final Order* and *Order Denying Petition for Reconsideration* was filed by the Coalition in Twin Falls County Case No. CV-2012-2096. The *Petition* was reassigned to this Court.

11. On April 17, 2013, the Director issued his *Final Order Regarding April 2013 Forecast Supply (Methodology 1-4)*. 382 R., pp.829-846. On May 22, 2013, the Director issued his *Order Denying Petition for Reconsideration; Denying Request for Hearing; Denying Motion to Authorize Discovery (Methodology Steps 1-4)*. 382 R., pp.888-893. A *Petition* seeking judicial review of that *Final Order* and *Order Denying Petition for Reconsideration* was filed by

5. On July 29, 2010, pursuant to the unopposed request of the parties, the Court entered an *Order* consolidating the six *Petitions for Judicial Review* into Gooding County Case No. CV-2010-382 ("Consolidated 382 Case").

6. On September 17, 2010, the Director issued his *Final Order Revising April 2010 Forecast Supply (Methodology Step 7)*. 382 R., pp.636-645. A *Petition* seeking judicial review of that *Final Order* was filed by the Coalition in Twin Falls County Case No. CV-2010-5520. The *Petition* was reassigned to this Court.

7. On November 30, 2010, the Director issued his *Final Order Establishing 2010 Reasonable Carryover (Methodology Step 9)*. 382 R., pp.684-692. A *Petition* seeking judicial review of that *Final Order* was filed by the Coalition in Twin Falls County Case No. CV-2010-5946. The *Petition* was reassigned to this Court.

8. On December 13, 2010, the Court issued an *Order* staying proceedings in the Consolidated 382 Case pending the Idaho Supreme Court's issuance of its written decision in Idaho Supreme Court Docket No. 38193-2010. The stay was entered pursuant to the request and agreement of the parties.

9. On January 3, 2011, pursuant to the unopposed request of the parties, the Court entered an *Order* consolidating the Coalition's *Petitions* in Twin Falls County Case Nos. CV-2010-5520 and 2010-5946 into consolidated the Consolidated 382 Case.

10. On April 13, 2012, the Director issued his *Final Order Regarding April 2012 Forecast Supply (Methodology Steps 1-8)*. 382 R., pp.728-742. On May 9, 2012, the Director issued his *Order Denying Petition for Reconsideration; Denying Motion to Authorize Discovery; Denying Request for Hearing (Methodology Steps 1-8)*. 382 R., pp.753-757. A *Petition* seeking judicial review of that *Final Order* and *Order Denying Petition for Reconsideration* was filed by the Coalition in Twin Falls County Case No. CV-2012-2096. The *Petition* was reassigned to this Court.

11. On April 17, 2013, the Director issued his *Final Order Regarding April 2013 Forecast Supply (Methodology 1-4)*. 382 R., pp.829-846. On May 22, 2013, the Director issued his *Order Denying Petition for Reconsideration; Denying Request for Hearing; Denying Motion to Authorize Discovery (Methodology Steps 1-4)*. 382 R., pp.888-893. A *Petition* seeking judicial review of that *Final Order* and *Order Denying Petition for Reconsideration* was filed by

III.

STANDARD OF REVIEW

Judicial review of a final decision of the director of IDWR is governed by the Idaho Administrative Procedure Act, Chapter 52, Title 67, Idaho Code § 42-1701A(4). Under IDAPA, the Court reviews an appeal from an agency decision based upon the record created before the agency. Idaho Code § 67-5277; *Dovel v. Dobson,* 122 Idaho 59, 61, 831 P.2d 527, 529 (1992). The Court shall not substitute its judgment for that of the agency as to the weight of the evidence on questions of fact. Idaho Code § 67-5279(1); *Castaneda v. Brighton Corp.,* 130 Idaho 923, 926, 950 P.2d 1262, 1265 (1998). The Court shall affirm the agency decision unless the court finds that the agency's findings, inferences, conclusions, or decisions are:

(a) in violation of constitutional or statutory provisions;

(b) in excess of the statutory authority of the agency;

(c) made upon unlawful procedure;

(d) not supported by substantial evidence on the record as a whole; or,

(e) arbitrary, capricious, or an abuse of discretion.

Idaho Code § 67-5279(3); *Castaneda,* 130 Idaho at 926, 950 P.2d at 1265. The petitioner must show that the agency erred in a manner specified in Idaho Code § 67-5279(3), and that a substantial right of the party has been prejudiced. I.C. § 67-5279(4). Even if the evidence in the record is conflicting, the Court shall not overturn an agency's decision that is based on substantial competent evidence in the record.[3] *Barron v. IDWR,* 135 Idaho 414, 417, 18 P.3d 219, 222 (2001). The Petitioner also bears the burden of documenting and proving that there was not substantial evidence in the record to support the agency's decision. *Payette River Property Owners Assn. v. Board of Comm'rs.*, 132 Idaho 552, 976 P.2d 477 (1999).

IV.

HISTORY AND PRIOR DETERMINATIONS

The *Petitions for Judicial Review* filed in this case arise in the context of an ongoing delivery call. Before the Court is the methodology established by the Director for determining

[3] Substantial does not mean that the evidence was uncontradicted. All that is required is that the evidence be of such sufficient quantity and probative value that reasonable minds *could* conclude that the finding – whether it be by a jury, trial judge, special master, or hearing officer – was proper. It is not necessary that the evidence be of such quantity or quality that reasonable minds *must* conclude, only that they *could* conclude. Therefore, a hearing officer's findings of fact are properly rejected only if the evidence is so weak that reasonable minds could not come to the same conclusions the hearing officer reached. *See eg. Mann v. Safeway Stores, Inc.* 95 Idaho 732, 518 P.2d 1194 (1974); *see also Evans v. Hara's Inc.*, 125 Idaho 473, 478, 849 P.2d 934, 939 (1993).

material injury to the Coalition's reasonable in-season demand and reasonable carryover caused by junior ground water rights, and his subsequent application of that methodology. Consideration of the issues requires a review of the prior administrative and judicial proceedings undertaken in relation to this call.

A. 2005 Delivery call.

The delivery call at issue here was filed by the Coalition in 2005. 551 R., pp.1-52. On May 2, 2005, the Director issued an *Amended Order* finding that junior ground water diversions from the ESPA were materially injuring the Coalition's natural flow and storage rights. 551 R., pp.1359-1424. The Director's *Amended Order* utilized a "minimum full supply" methodology in determining material injury. 551 R., pp.1382-1385. That methodology relied upon a baseline analysis to determine material injury based upon shortfalls to a chosen baseline quantum of the Coalition's in-season irrigation and reasonable carryover needs. *Id.*

Various parties sought an administrative hearing before the Department on the *Amended Order*. *See e.g.,* 551 R., pp.1642-1657; 551 R., pp.1704-1724. However, that was put on hold while members of the Coalition filed a declaratory judgment action challenging the constitutionality of the Conjunctive Management Rules ("CM Rules").[4] The declaratory judgment action culminated in the Idaho Supreme Court's written decision in *American Falls Reservoir Dist. No. 2 v. Idaho Dep't of Water Res.*, 143 Idaho 862, 154 P.3d 433 (2007) ("*AFRD#2*"), which upheld the CM Rules as facially constitutional. Thereafter, the Department proceeded with an administrative hearing on the *Amended Order*. The Director appointed the Honorable Gerald F. Schroeder as the presiding hearing officer ("Hearing Officer").

B. Director's *2008 Final Order.*

The Hearing Officer issued his *Opinion Constituting Findings of Fact, Conclusions of Law and Recommendation* on April 29, 2008. 551 R., pp.7048-7118. The Hearing Officer's *Recommendation* analyzed the Director's use of a minimum full supply methodology in determining material injury to the Coalition. 551 R., pp.7086-7095. The Hearing Officer generally approved the Director's use of a minimum full supply methodology, including his use

[4] The term "Conjunctive Management Rules" or "CM Rules" refers to the *Rules for Conjunctive Management of Surface and Ground Water Resources,* IDAPA 37.03.11.

of a baseline as a starting point for the consideration of the call and in determining material injury. *Id.* But, the Hearing Officer noted that "[t]here have been applications of the concept of a minimum full supply that should be modified if the use of the protocol is to be retained," and that "there must be adjustments as conditions develop if any baseline supply concept is to be used." 551 R., pp.7091 & 7093. Exceptions to the Hearing Officer's *Recommendation* were subsequently filed with the Director by various parties. *See e.g.,* 551 R., pp.7126-7134; 551 R., pp.7141-7197.

On September 5, 2008, the Director issued his *Final Order Regarding the Surface Water Coalition Delivery Call* ("*2008 Final Order*"). 551 R., pp.7381-7395. The *2008 Final Order* adopted the findings of fact and conclusions of law of the Hearing Officer's *Recommendation* except as specifically modified therein, including his recommendation that certain refinements be made to the minimum full supply methodology for determining material injury. 551 R., p.7387. Of significance to the instant proceeding, the Director abandoned the "minimum full supply" methodology in his *2008 Final Order* in favor of a "reasonable in-season demand" methodology. 551 R., p.7386. Although the Director adopted the Hearing Officer's recommendation that refinements be made, he did not address those refinements or the details of his new "reasonable in-season demand" methodology in his *2008 Final Order*, stating:

> Because of the need for ongoing administration, the Director will issue a separate final order . . . detailing his approach for predicting material injury to reasonable in-season demand and reasonable carryover for the 2009 irrigation season.

551 R., p.7386. *Petitions* seeking judicial review of the Director's *2008 Final Order* were subsequently filed in Gooding County Case No. CV-2008-551.

C. District court decision in Gooding County Case No. CV-2008-551 and Director's orders on remand.

The district court entered its *Order on Petition for Judicial Review* in Gooding County Case No. CV-2008-551 on July 24, 2009. 551 R., pp.10075-10108. The district court upheld the Director's adoption of a baseline methodology for determining material injury. It held that "[t]he Director did not abuse discretion or act outside his authority in utilizing a 'minimum full supply' or 'reasonable in-season demand' baseline for determining material injury." 551 R., p.10099. However, the court did find that the Director abused his discretion by waiting to issue a separate

final order detailing his approach for determining material injury to reasonable in-season demand and reasonable carryover. The case was therefore remanded to the Director. 551 R., pp.10106-10107. On remand, the Director complied with the district court's instruction. On June 23, 2010, the Director issued his *Methodology Order*, which by its terms provides the Director's methodology for determining material injury to reasonable in-season demand and reasonable carryover. 382 R., pp.564-604. Additionally, on June 24, 2010, the Director issued his *As-Applied Order*, wherein he applied his methodology to determine material injury to members of the Coalition in 2010. 382 R., pp.605-625. Both *Orders* are presently before the Court in this proceeding.

D. Idaho Supreme Court's decision in *In the Matter of Distribution of Water to Various Water Rights Held by or for the Benefit of A&B Irr. Dist.*

Meanwhile, the Coalition appealed the District Court's *Order on Petition for Judicial Review* in Gooding County Case No. CV-2008-551. On December 17, 2013, the Idaho Supreme Court issued its written decision in *In the Matter of Distribution of Waters to Various Water Rights Held by or for the Benefit of A&B Irr., Dist.,* 155 Idaho 640, 315 P.3d 828 (2013) ("*2013 SWC Case*"). In that decision, the Court held that the Director may employ a baseline methodology for management of water resources, and as a starting point in administration proceedings for considering material injury. *2013 SWC* Case, 155 Idaho at 650, 315 P.3d at 838. Although the Director's *Methodology Order* had been issued prior to the Supreme Court's consideration of the *2013 SWC Case*, the Court in its opinion made clear that "since the district court did not review this final methodology order, the findings of fact that shape that methodology and any modifications to the methodology are not properly before this Court." *2013 SWC Case*, 155 Idaho at 649, 315 P.3d at 837.

V.

METHODOLOGY ORDER ANALYSIS

The stated purpose of the Director's *Methodology Order* "is to provide the methodology by which the Director will determine material injury to [reasonable in-season demand] and reasonable carryover to members of the SWC." 382 R., p.591. Section II of the *Methodology Order* details the Director's approach for determining material injury to reasonable in-season

demand. 382 R., pp.565-585. Section III of the *Methodology Order* details the Director's approach for determining material injury to reasonable carryover. 382 R., pp.585-590. The *Methodology Order* then sets forth a ten step process to be undertaken annually for purposes of determining material injury. 382 R., pp.597-601. The Coalition, IGWA and the City of Pocatello seek judicial review of various aspects of the Director's methodology.

A. The *Methodology Order* fails to provide a proper remedy for material injury to reasonable in-season demand when taking into account changing conditions.

The Coalition argues that the signature flaw of the *Methodology Order* is its failure to properly remedy material injury to reasonable in-season demand based on changing conditions during the irrigation season. It asserts that if material injury to its reasonable in-season demand is greater than originally determined by the Director, the *Methodology Order's* failure to remedy that injury through either curtailment or the requirement of a mitigation plan is contrary to Idaho law. For the reasons set forth below, this Court agrees.

i. Overview of the Director's methodology for determining material injury to reasonable in-season demand.

Reasonable in-season demand is defined under the *Methodology Order* as "the projected annual diversion volume for each SWC entity during the year of evaluation that is attributable to the beneficial use of growing crops within the service area of the entity." 382 R., p.575. Under steps 1 and 2 of the *Methodology Order,* the Director calculates the crop water needs of the Coalition for that year.[5] However, the Director's initial determination of reasonable in-season demand is not based on those calculations, but rather is based on a historic demand baseline analysis. The *Methodology Order* makes this clear, providing that reasonable in-season demand is initially "equal to the historic demands associated with a baseline year or years ("BLY") as selected by the Director, but will be corrected during the season to account for variations in the climate and water supply between the BLY and actual conditions." 382 R., p.568. The *Methodology Order* uses the values of 2006 and 2008 to arrive at an average baseline year for purposes of the initial reasonable in-season demand determination. 382 R., p.574.

[5] The term "crop water need" is defined in the *Methodology Order* as "the project wide volume of irrigation water required for crop growth, such that crop development is not limited by water availability, for all crops supplied with surface water by the surface water provider." 382 R., p.579.

Under step 3, the Director makes his initial determination of water supply. Step 3 occurs after the United States Bureau of Reclamation ("USBOR") and the United States Corps of Engineers ("USACE") issue their Joint Forecast predicting unregulated inflow volume at the Heise Gage. 382 R., p.598. The Joint Forecast is typically released within the first two weeks of April. *Id.* Thereafter, the Director issues an April Forecast Supply for the water year. *Id.* The Director also determines in step 3 whether a demand shortfall to any member of the Coalition will occur in the coming season. *Id.* Demand shortfall is the difference between reasonable in-season demand and the April Forecast Supply. *Id.* If reasonable in-season demand is greater that the April Forecast Supply, a demand shortfall exists. *Id.*

Under step 4, if the demand shortfall is greater than the reasonable carryover shortfall from the previous year,[6] material injury exists or will exist, and junior users are required to establish their ability to mitigate that injury to avoid curtailment. 382 R., pp.598-599. To mitigate, junior users only need establish their ability to secure mitigation water to be provided to the Coalition at a later date, which the Director refers to as the "Time of Need." The Director then makes adjustments to his calculations throughout the irrigation season as conditions develop. These adjustments are provided for in steps 6 and 7 of the *Methodology Order*, which provide that at various times throughout the irrigation season, the Director will recalculate reasonable in-season demand and adjust demand shortfall for each member of the Coalition. 382 R., pp.599-600. The Director's recalculations are based on actual crop water need up to that point and a revised Forecast Supply, among other things. *Id.*

Step 8 addresses the obligations of junior water users after the Director makes his in-season recalculations and adjustments. These obligations generally trigger when Coalition members have exhausted their storage water rights to where all that remains in the reservoirs is an amount of water equal to their reasonable carryover. The Director refers to this as the "Time of Need."[7] Step 8 provides:

> Step 8: At the Time of Need, junior ground water users are required to provide the lesser of the two volumes from Step 4 (May 1 secured water) and the

[6] Junior water users will have previously mitigated for any reasonable carryover shortfall from the previous year under step 9 of the *Methodology Order*. 382 R., pp.600-601.

[7] The *Methodology Order* provides that "[t]he calendar day determined to be the Time of Need is established by predicting the day in which the remaining storage allocation will be equal to reasonable carryover, or the difference between the 06/08 average demand and the 02/04 supply. The Time of Need will not be earlier than the Day of Allocation." 382 R., p.584 fn.9.

[reasonable in-season demand] volume calculated at the Time of Need. **If the calculations from steps 6 or 7 indicate that a volume of water necessary to meet in-season projected demand shortfalls is greater than the volume from Step 4, no additional water is required.**

382 R., p.600. While junior user's original mitigation obligation for material injury to reasonable in-season demand may be adjusted downward under the plain language of step 8, it may not be adjusted upward.

ii. Idaho law requires that out-of-priority diversions can only be permitted pursuant to a properly enacted mitigation plan.

The Coalition takes issue with step 8 of the *Methodology Order*. They assert that it unlawfully permits out-of-priority water use to occur without remedy of curtailment or a properly enacted mitigation plan. This Court agrees. In the *2013 SWC Case*, the Idaho Supreme Court held that the CM Rules "require that out-of-priority diversions only be permitted pursuant to a properly enacted mitigation plan." *2013 SWC Case*, 155 Idaho at 653, 315 P.3d at 841. Further, that when the Director responds to a delivery call "the Director shall either regulate and curtail the diversions causing injury or approve a mitigation plan that permits out-of-priority diversion." *Id.* at 654, 315 P.3d at 842. The Court's holding in this respect was based on the plain language of Rule 40 of the CM Rules, which provides that once the Director makes a determination of material injury, the Director shall:

> a. Regulate the diversion and use of water in accordance with the priorities of rights of the various surface or ground water users whose rights are included within the district . . .; or
>
> b. Allow out-of-priority diversion of water by junior-priority ground water users pursuant to a mitigation plan that has been approved by the Director.

IDAPA 37.03.11.040.01.a, b.

This Court finds that step 8 of the *Methodology Order* is inconsistent with Rule 40 of the CM Rules and the precedent established in the *2013 SWC Case*. Step 8 effectively caps junior users' mitigation obligations for material injury to reasonable in-season demand to that amount determined in step 4. This determination is made in or around April. The cap remains in place even if changing conditions during the irrigation season establish that material injury to reasonable in-season demand is greater than originally determined. When that scenario arises,

step 8 provides that junior users are required to deliver to the Coalition the water they previously secured as mitigation under step 4. Even though that amount of water will be insufficient to remedy the full extent of material injury, the plain language of step 8 provides that "no additional water is required." The result is that material injury to reasonable in-season demand is realized by the Coalition, out-of-priority junior water use occurs, and no remedy of curtailment or the requirement of a mitigation plan exists to address that injury. The endorsement of such unmitigated out-of-priority water use is contrary to Idaho's doctrine of prior appropriation.

The Director justifies his decision as follows. First, he states that "the purpose of predicting need is to project an upper limit of material injury at the start of the season." 382 R., p.569. He then provides:

> Just as members of the SWC should have certainty at the start of the irrigation season that junior ground water users will be curtailed, in whole or in part, unless they provide the required volume of mitigation water, in whole or in part, junior ground water users should also have certainty entering the irrigation season that the predicted injury determination will not be greater than it is ultimately determined at the Time of Need . . . . **If it is determined at the time of need that the Director under-predicted the demand shortfall, the Director will not require that junior ground water users make up the difference, either through mitigation or curtailment. This determination is based upon the Director's discretion and his balancing of the principle of priority of right with the principles of optimum utilization and full economic development of the State's water resources. Idaho Const. Art XV, § 3; Idaho Const. Art. XV, § 7; Idaho Code § 42-106; Idaho Code § 42-226.**

382 R., p.594 (emphasis added).

The justifications relied upon by the Director do not permit out-of-priority water use in contravention of CM Rule 40 and the *2013 SWC Case*. Neither Article XV, Section 3, nor Article XV, Section 7 of the Idaho Constitution permits such water use to occur under the circumstances presented. The Idaho Supreme Court has held that nothing in Article XV, § 7 "grants the legislature or the Idaho Water Resource Board the authority to modify that portion of Article XV, §3, which states, 'Priority of appropriation shall give the better right as between those using the water [of any natural stream].'" *Clear Springs Foods, Inc. v. Spackman*, 150 Idaho 790, 807, 252 P.3d 71, 88 (2011). With respect to Idaho Code § 42-226, the Idaho Supreme Court has directed that it, and its reference to "full economic development," has no application in delivery calls between senior surface water users and junior ground water users, such as the one at issue here. *A&B Irr. Dist. v. Idaho Dept. of Water Res.*, 153 Idaho 500, 509,

284 P.3d 225, 234 (2012). The Court therefore finds that the legal justifications expressly relied upon by the Director do not support his determination to refrain from requiring further mitigation or curtailment from junior users if material injury to reasonable in-season demand is greater than originally determined in step 4 due to changing conditions.

iii. The Director's "total water supply" argument does not justify out-of-priority diversions without a properly enacted mitigation plan.

In briefing and at oral argument, counsel for the Department asserts another justification for step 8 of the *Methodology Order*. Counsel argues that under a "total water supply" theory, "the Director is not required to determine material injury to in-season demand and 'reasonable carryover' separately, nor is he required to order separate mitigation for each."[8] Counsel suggests that if material injury to reasonable in-season demand is greater than originally determined under step 4, the Department need not curtail or require a mitigation plan to make up the difference. Rather, it can require Coalition members to exhaust their reasonable carryover to cure the material injury. Then, at a point later in the year, make a subsequent determination as to material injury to reasonable carryover and mitigation at that time. In so arguing, counsel refers to steps 9 and 10 of the *Methodology Order*, wherein the Director in or around November 30th determines material injury to reasonable carryover and establishes the mitigation obligations of the juniors. This Court rejects this argument.

As an initial matter, counsel's total water supply argument appears contrary to the plain language of the Director's *Methodology Order*. The *Methodology Order* itself contains separate and unique methodologies for determining material injury to reasonable in-season demand (Section II) and reasonable carryover (Section III).[9] 382 R., pp.565 & 585. The methodologies described in Sections II and III of the *Methodology Order* establish that a determination of material injury will be conducted for both reasonable in-season demand and for reasonable carryover, and that such determinations will be conducted and mitigated separately. *Id.* For

[8] The Court notes that this justification was not set forth by the Director in his *Methodology Order*. Notwithstanding, the Court will address the argument.

[9] Section II of the *Methodology Order* is entitled "Methodology for Determining Material Injury to Reasonable In-Season Demand." 382 R, p.565. Section III of the *Methodology Order* is entitled "Methodology for Determining Material Injury to Reasonable Carryover." 382 R., p.585.

example, when detailing his methodology for determining material injury to reasonable in-season demand in Section II, the Director sets forth his calculation of demand shortfall and directs:

> The amount calculated represents the volume that junior ground water users will be required to have available for delivery to members of the SWC found to be materially injured by the Director. The amounts will be calculated in April, **and if necessary, at the middle of the seasons and at the time of need.**

382 R., p.585 (emphasis added). The argument is also contrary to steps 3 and 4 of the *Methodology Order*, wherein the Director mitigates for material injury to reasonable in-season demand by requiring junior users to establish their ability to secure mitigation water or face curtailment. 382 R., pp.598-599.

More importantly, the total water supply argument is contrary to law. The concept of a "total water supply" arises out of Rule 42 of the CM Rules. The Rule permits the Director to consider the Coalition's natural flow and storage rights in conjunction with one another when determining material injury. IDAPA 37.03.011.042.g. Indeed, the Director does so in his *Methodology Order* when determining material injury to reasonable in-season demand as well as in determining the Coalition's "Time of Need." However, problems arise when the Coalition is required to deplete its reasonable carryover, *in addition to its other storage water*, to address its material injury to reasonable in-season demand. Under Idaho law the holder of a surface water storage right is entitled to maintain a reasonable amount of carryover-over storage to assure water supplies for future dry years. IDAPA 37.03.011.042.g; *AFRD#2*, 143 Idaho at 880, 154 P.3d at 451. Counsel's argument fails to address what happens if the Coalition's reasonable carryover is insufficient to address the full extent of material injury to reasonable in-season demand. Additionally, while the Coalition will have been required to deplete its reasonable carryover under counsel's argument, out-of-priority water use will have occurred without curtailment or the enactment of a mitigation plan. If junior users are unable to secure all or part of their mitigation obligation in November due to cost, scarcity or unwillingness, the remedy of curtailment is lost, as the out-of-priority water use will have already occurred. In that scenario, there is no contingency to protect senior rights as required by the *2013 SWC Case*. Such a result is not contemplated by the CM Rules, and is in contravention of the plain language of CM Rule 40 and the Idaho Supreme Court's precedent in the *2013 SWC Case*.

iv. The Director may require use of reasonable carryover pursuant to a properly enacted mitigation plan that contains appropriate contingency provisions to protect senior rights.

In conjunction with step 8, if the Director determines a greater volume of water is necessary than the previously determined to address material injury to reasonable in-season demand, the ability of junior users to secure additional in-season water during what is typically the most water intensive stage of the irrigation season is problematic. Further problematic is that curtailment at that stage would not only have a devastating impact on junior users but may not timely provide sufficient water to the Coalition. Accordingly, curtailment may still not prevent the Coalition from relying on its reasonable carryover to help get through the remainder of the irrigation season. Nonetheless, a viable mitigation plan is still possible.

In conjunction with a properly enacted and approved mitigation plan, the Director could require the Coalition to rely on its reasonable carryover provided that: 1) existing carryover storage allocations meet or exceed the additional shortfall to the revised reasonable in-season demand; and 2) junior users secure a commitment at that time for a volume of water equal to the shortfall to the revised reasonable in-season demand to be provided the following season if necessary. This could be accomplished through an option or lease to provide water. The water would provide mitigation for any shortfalls to reasonable carryover determined to exist at the end of the season. If no shortfall is determined to exist due to changing conditions, then the option or lease need not be exercised. If a shortfall is determined to exist, then the option or lease is in place to be exercised in whole or in part as required to mitigate for any shortfall. The water would be secured but not have to be provided until such time as it can be determined whether or not the storage allocations will fill next season. This process eliminates the risk of the Director not being able to compel junior users to secure water at the end of the season in lieu of curtailment the following season. And, curtailment the following season may not provide sufficient water in storage to remedy the injury to storage, particularly if curtailment will also be required as a result of a demand shortfall to reasonable in-season demand the following season.

The process is consistent with the requirement set forth in the *2013 SWC Case* "that out-of-priority diversions only be permitted pursuant to a properly enacted mitigation plan." *2013 SWC Case*, 155 Idaho at 653, 315 P.3d at 841. It also eliminates the problem of securing water that will not be put to beneficial use because the water is being secured for the next season and

the amount secured can be adjusted down at the end of the instant season thereby leaving plenty of time for the unneeded water to be used elsewhere. Following any adjustment at the end of the instant season the amount of water that ultimately be secured would be the same as is currently required under Step 9.

B. The *Methodology Order's* use of the values of 2006 and 2008 to arrive at an average baseline year for purposes of the initial reasonable in-season demand determination is supported by substantial evidence.

The Coalition argues that the Director's use of the values of 2006 and 2008 to arrive at an average baseline year for purposes of the initial reasonable in-season demand determination is not supported by substantial evidence and must be set aside. 382 R., p.574. The Idaho Supreme Court has already approved the Director's employment of a baseline methodology as a starting point in administration proceedings and for determining material injury. *2013 SWC Case*, 155 Idaho at 648-653, 315 P.3d at 836-841. The Court finds that the Director's use of the values of 2006 and 2008 to arrive at an average baseline year is supported by substantial evidence.

The *Methodology Order* explains that a baseline year is selected by analyzing three factors: (1) climate; (2) available water supply; and (3) irrigation practices. 382 R., p. 569. To capture current irrigation practices, the *Methodology Order* limits the identification of a baseline year to 1999 and beyond. *Id.* Additionally, the *Methodology Order* instructs as follows:

> [A] BLY should represent a year(s) of above average diversions, and should avoid years of below average diversions. An above average diversion year(s) selected as the BLY should also represent a year(s) of above average temperatures and ET, and below average precipitation to ensure that increased diversions were a function of crop water need and not other factors. In addition, actual supply (Heise natural flow and storage) should be analyzed to assure that the BLY is not a year of limited supply.

382 R., p.570. The Director found that "using the values of 2006 and 2008 (06/08) to arrive at an average BLY fits the selection criteria for all members of the Coalition."[10] 382 R., p.574. In so holding, the Director made findings that the 06/08 average has below average precipitation, near average ET, above average growing degree days, and represents years in which diversions were not limited by availability of water supply. *Id.* These findings are supported by the record.

[10] The Director determined that using values from a single year would not fit the selection criteria for all members of the Coalition. 382 R., p.574.

See 551 R., Ex. 8000, Vol. IV, Appdx. AS-1-8. Therefore, the Court finds that the Director's decision in this respect was reached through an exercise of reason, is within the limits of his discretion and must be affirmed.

Furthermore, the Court's holding regarding step 8 of the *Methodology Order* should alleviate the concerns raised by the Coalition on this issue. The baseline year should only be used as a starting point. As set forth above, it cannot result in the implementation of a cap on junior users' mitigation obligations. If changing conditions establish that material injury is greater than originally determined pursuant to the baseline analysis, then adjustments to the mitigation obligations of the juniors must be made when the Director undertakes his mid-season recalculations. The Coalition's concerns should be addressed since the mid-season adjustments include recalculating reasonable in-season demand for each member of the Coalition based on, among other things, actual crop water need to that point. 382 R., p.599.

C. The *Methodology Order's* provision for the consideration of supplemental ground water does not violate Idaho law. However, the Director's finding regarding ground water fractions is not supported by substantial evidence and must be remanded.

Step 1 of the *Methodology Order* provides in part that "[i]n determining the total irrigated acreage [of Coalition members], the Department will account for supplemental ground water use." 382 R., p.597. The Coalition argues that the *Methodology Order's* consideration of supplemental ground water use violates Idaho law and has no relevance to the administration of the Coalition's senior rights. This Court disagrees. The Idaho Supreme Court has directed that in responding to a delivery call, the Director has the authority "to consider circumstances when the water user is not irrigating the full number of acres decreed under the water right." *AFRD#2*, 143 Idaho at 876, 154 P.3d at 447. If it is established that acreage accounted for under the Coalition's senior surface water rights is being irrigated from a supplemental ground water source, that is a factor the Director has the authority to consider in the context of a delivery call. If the supplemental ground water rights being used are themselves subject to curtailment under the senior call, (as suggested may be the case here by the Hearing Officer[11]), that factor should also be accounted for by the Director. However, the *Methodology Order's* instruction that the Department will consider supplemental ground water use when determining the total irrigated

[11] 551 R., p.7507

acreage of Coalition members does not violate Idaho law. The Director's decision to include that instruction in the *Methodology Order* is affirmed.

That said, the Court finds that the Director's assignment of an entity wide split for each member of the Coalition of the ground water fraction to the surface water fraction is not supported by substantial evidence in the record. In the *Methodology Order*, the Director makes the following finding:

> All acres identified as receiving supplemental ground water within the boundaries of a single SWC entity will initially be evaluated by assigning an entity wide split of the ground water fraction to the surface water fraction as utilized in the development of the ESPA Model. *See Ex. 8000 Vol. II, Bibliography at II,* referencing *Final ESPA Model, IWRRI Technical Report 06-002 & Design Document DDW-017.* For each entity the ground water fraction to the surface water fraction is as follows: A&B 95:5; AFRD2 30:70; BID 30:70; Milner 50:50; Minidoka 30:70; NSCC 30:70; & TFCC 30:70. If these ratios change with a subsequent version of the ESPA Model, the Department will use the values assigned by the current version of the ESPA Model.

382 R., p.576 fn.6. The Coalition argues that there is no factual support in the record justifying these ground water fractions, and that the Director's finding is arbitrary and capricious. The Department, IGWA and the City of Pocatello do not respond to the Coalition's argument in this respect.

A review of the record supports the Coalition's position. The record does not contain evidence that acres accounted for under the Coalition's senior surface water rights are being irrigated from a supplemental ground water source. Or that the ground water fractions utilized by the *Methodology Order* reflect such supplemental ground water use. If the Director is going to administer to less than the full amount of acres set forth on the face of the Coalition's *Partial Decrees*, such a determination must be supported by clear and convincing evidence. *See. e.g., A&B Irr. Dist., v. Idaho Dept. of Water Res.*, 153 Idaho 500, 524, 284 P.3d 225, 249 (holding, "Once a decree is presented to an administrating agency or court, all changes to that decree, permanent or temporary, must be supported by clear and convincing evidence"). Here, the parties fail to cite the Court to anything submitted before the Department in either written form or via oral testimony establishing the use of supplemental ground water by individual irrigators within the Coalition. That such was the case is illustrated by the Hearing Officer's limited findings on the issue. He found only that "an undetermined number of individual irrigators within SWC *may hold supplemental ground water rights. . . .*" and that "[i]t would seem that any

such ground water rights would be junior to the surface irrigations rights and subject to curtailment." 551 R., p.7507 (emphasis added). The Director did not address the Hearing Officer's findings in his *Methodology Order*, or include any further analysis on his findings. Rather, to support his ground water fraction finding, the Director cites to a document entitled *Final ESPA Model, IWRRI Technical Report 06-002 & Design Document DDW-017*, which is not in the record. Therefore, the Court finds the Director's finding is not supported by substantial evidence in the record. The Director's ground water fractions as set forth in the *Methodology Order* are hereby set aside and remanded for further proceedings as necessary.

D. The *Methodology Order's* reliance upon the Joint Forecast, and its use of the Heise Gage, to determine the available water supply for the Twin Falls Canal Company is set aside and remanded for further proceedings as necessary.

The Coalition argues that the Director's reliance upon the Joint Forecast, and its focus on the Heise Gage, to predict the available water supply for the Twin Falls Canal Company is arbitrary and capricious and not supported by substantial evidence. In response to this argument, the Department concedes the following in its briefing:

> The Department recognizes that while the Joint Forecast is a "good indicator" for predicting the supplies of most Coalition members, it is "not the best evidence" for purposes of predicting TFCC's supply. *SWC Methodology Brief* at 36. The Director has "previously expressed to TFCC that the Department is willing to work with the TFCC to improve the predictors for TFCC for future application in the Methodology Order and Department staff have even met with TFCC consultants on this issue."

Corrected Br. of Respondents, p.37 fn.30 (July 30, 2014). As a result, the Coalition's argument on this issue is unopposed. Therefore, the Director's decision in this respect is set aside and remanded for further proceedings as necessary.

E. The Director in his discretion may use the U.S. Department of Agriculture's National Agriculture Statistics Service data as a factor in determining crop water need, but should also take in account available data reflecting current cropping patterns.

Under steps 1 and 2 of the *Methodology Order*, the Director calculates the crop water needs of the Coalition for that year. In determining crop water need, the *Methodology Order* instructs that among other things the Director "will utilize crop distributions based on

distributions from the United States Department of Agriculture's National Agricultural Statistics Service ("NASS")." 382 R., p.580. The *Methodology Order* goes onto provide:

> NASS reports annual acres of planted and harvested crops by county. NASS also categorizes harvested crops by irrigation practice, i.e., irrigated, non irrigated, non irrigated following summer fallow, etc. *Crop distribution acreage will be obtained from NASS by averaging the "harvested" area for "irrigated" crops from 1990-2008.* Years in which harvested values were not reported will not be included in the average. In the future, the NASS data may not be the most accurate source of data. The Department prefers to rely on data from the current season if and when it becomes usable.

Id. (emphasis added). The Coalition argues that the *Methodology Order's* designation of NASS data for 1990-2008 average crop distribution fails to capture current cropping patterns, resulting in under-determined crop water need. Specifically, that changes in cropping patterns have resulted in the planting of more water intensive crops such as corn and alfalfa in recent years which is not reflected in the 1990-2008 data.

The Court finds that the Director's decision to use NASS data as a factor in determining the Coalition's crop water need is a matter within his discretion. That said, while the Director may use historic cropping data as a starting point in determining crop water need, he should also take into account available data reflecting current cropping patterns. The *Methodology Order* provides that "the Department prefers to rely on data from the current season if and when it becomes usable." 382 R., p.580. Likewise, the Hearing Officer in addressing the issue of crop water need made the following recommendation which was adopted by the Director:

> **If there have been significant cropping changes resulting in either greater or less need for water, those factors should be factored.** This is an area of caution. Cropping decisions are matter for the irrigators acting within their water rights. Those decisions should be driven by the market. The fact that a particular crop may take less water does not dictate that it be planted.

551 R., p.7099. Taking in account available data reflecting current cropping patterns also addresses the Coalition's concerns regarding the Director's decision to factor in only "harvested" area when considering historic NASS data. Since the *Methodology Order* already provides that the Director prefers to use data from the current seasons if and when it becomes usable, no remand is necessary on this issue.

iv. The Director may require use of reasonable carryover pursuant to a properly enacted mitigation plan that contains appropriate contingency provisions to protect senior rights.

In conjunction with step 8, if the Director determines a greater volume of water is necessary than the previously determined to address material injury to reasonable in-season demand, the ability of junior users to secure additional in-season water during what is typically the most water intensive stage of the irrigation season is problematic. Further problematic is that curtailment at that stage would not only have a devastating impact on junior users but may not timely provide sufficient water to the Coalition. Accordingly, curtailment may still not prevent the Coalition from relying on its reasonable carryover to help get through the remainder of the irrigation season. Nonetheless, a viable mitigation plan is still possible.

In conjunction with a properly enacted and approved mitigation plan, the Director could require the Coalition to rely on its reasonable carryover provided that: 1) existing carryover storage allocations meet or exceed the additional shortfall to the revised reasonable in-season demand; and 2) junior users secure a commitment at that time for a volume of water equal to the shortfall to the revised reasonable in-season demand to be provided the following season if necessary. This could be accomplished through an option or lease to provide water. The water would provide mitigation for any shortfalls to reasonable carryover determined to exist at the end of the season. If no shortfall is determined to exist due to changing conditions, then the option or lease need not be exercised. If a shortfall is determined to exist, then the option or lease is in place to be exercised in whole or in part as required to mitigate for any shortfall. The water would be secured but not have to be provided until such time as it can be determined whether or not the storage allocations will fill next season. This process eliminates the risk of the Director not being able to compel junior users to secure water at the end of the season in lieu of curtailment the following season. And, curtailment the following season may not provide sufficient water in storage to remedy the injury to storage, particularly if curtailment will also be required as a result of a demand shortfall to reasonable in-season demand the following season.

The process is consistent with the requirement set forth in the *2013 SWC Case* "that out-of-priority diversions only be permitted pursuant to a properly enacted mitigation plan." *2013 SWC Case*, 155 Idaho at 653, 315 P.3d at 841. It also eliminates the problem of securing water that will not be put to beneficial use because the water is being secured for the next season and

procedural background of the *Methodology Order* makes clear that it was issued in response to the Coalition's 2005 call. In his 2008 *Final Order*, the Director explained he would be issuing a separate final order because of the need for ongoing administration. 551 R., p.7386. The stated purpose of the *Methodology Order* is "to set forth the Director's methodology for determining material injury to RISD and reasonable carryover to members of the SWC." 382 R., p.565. Therefore, the Court finds that the *Methodology Order's* baseline methodology is used in an administrative context "in determining material injury in the context of a water call." *2013 SWC Case*, 155 Idaho at 650, 315 P.3d at 838.

The Idaho Supreme Court has directed that "[w]hile there must be a timely response to a delivery call, neither the Constitution nor statutes place any specific timeframes on this process," and that it is "vastly more important that the Director have the necessary and pertinent information and the time to make a reasoned decision based on the available facts." *AFRD#2*, 143 Idaho at 875, 154 P.3d at 446. In this case, the Director found that it is necessary to wait until the Joint Forecast is issued to make the initial determinations at issue here. 382 R., p.572. He held that "given current forecasting techniques, the earliest the Director can predict material injury to RISD 'with reasonable certainty' is soon after the Joint Forecast is issued." 382 R., p.582. In so finding, the Director held that the Joint Forecast "is generally as accurate a forecast as is possible using current data gathering and forecasting techniques." 382 R., p.572. And, that it is "a good indicator of the total available irrigation water supply for a season." *Id.* The Director's holding is supported by the record. *See. e.g.*, 551 R., p.1379. Therefore, the Court finds that the Director's decision in this respect was reached through an exercise of reason, is within the limits of his discretion and must be affirmed.

G. The Director's use of the ESPA Model boundary to determine a curtailment priority date in steps 4 and 10 of the *Methodology Order* is set aside and remanded.

The Coalition argues that steps 4 and 10 of the *Methodology Order* unlawfully and arbitrarily reduce junior ground water acres subject to administration in the event of curtailment. Step 4 provides in part as follows:

> If junior ground water users fail or refuse to provide this information by May 1, or within fourteen (14) days from issuance of the values set forth in Step 3, whichever is later in time, the Director will issue an order curtailing junior ground water users. Modeled curtailment shall be consistent with previous Department

> efforts. The ESPA Model will be run to determine the priority date necessary to produce the necessary volume within the model boundary of the ESPA. However, because the Director can only curtail junior ground water rights within the area of common ground water supply, CM Rule 50.01, junior ground water users will be required to meet the volumetric obligation within the area of common ground water supply, not the full model boundary.

382 R., p.598-599.

The plain language of step 4 directs that the Director will use the ESPA Model to determine the curtailment priority date necessary to remedy material injury "within the model boundary of the ESPA." *Id.* Step 4 then notes that under the CM Rules, the Director "can only curtail junior ground water rights within the area of common ground water supply." *Id.* Thus, step 4 recognizes a conflict between the model boundary of the ESPA and the area of common ground water supply. The conflict arises from the fact that the ESPA Model boundary and the boundary of the area of common ground water supply – as it is defined by the CM Rules – are not consistent with one another. The ESPA Model boundary is larger, and contains ground water rights that are not within the area of common ground water supply. This fact is undisputed by the parties. It is the Coalition's position that the *Methodology Order* wrongly uses the ESPA Model boundary, instead of the boundary of the area of common water supply, to determine a curtailment priority date. And, that the Director's practice in this respect results in unmitigated material injury contrary to law. This Court agrees.

When a senior water user seeks the conjunctive administration of ground water rights under the CM Rules, the senior user is seeking administration within the area of common ground water supply. The plain language of CM Rules make this clear. The Rules prescribe the procedures for responding to a delivery call made "in an area having a common ground water supply."[12] IDAPA 37.03.11.001. Likewise, the Rules provide for administration when a delivery call is made by the holder of a senior-priority water right "alleging that by reason of diversion of water by the holders of one (1) or more junior-priority ground water rights ... from

---

[12] An "area having a common ground water supply" is defined as:

> A ground water source within which the diversion and use of ground water or changes in in ground water recharge affect the flow of water in a surface water source or within which the diversion and use of water by a holder of a ground water right affects the ground water supply available to the holders of other ground water rights.

IDAPA 37.03.11.010.01

Under step 3, the Director makes his initial determination of water supply. Step 3 occurs after the United States Bureau of Reclamation ("USBOR") and the United States Corps of Engineers ("USACE") issue their Joint Forecast predicting unregulated inflow volume at the Heise Gage. 382 R., p.598. The Joint Forecast is typically released within the first two weeks of April. *Id.* Thereafter, the Director issues an April Forecast Supply for the water year. *Id.* The Director also determines in step 3 whether a demand shortfall to any member of the Coalition will occur in the coming season. *Id.* Demand shortfall is the difference between reasonable in-season demand and the April Forecast Supply. *Id.* If reasonable in-season demand is greater that the April Forecast Supply, a demand shortfall exists. *Id.*

Under step 4, if the demand shortfall is greater than the reasonable carryover shortfall from the previous year,[6] material injury exists or will exist, and junior users are required to establish their ability to mitigate that injury to avoid curtailment. 382 R., pp.598-599. To mitigate, junior users only need establish their ability to secure mitigation water to be provided to the Coalition at a later date, which the Director refers to as the "Time of Need." The Director then makes adjustments to his calculations throughout the irrigation season as conditions develop. These adjustments are provided for in steps 6 and 7 of the *Methodology Order*, which provide that at various times throughout the irrigation season, the Director will recalculate reasonable in-season demand and adjust demand shortfall for each member of the Coalition. 382 R., pp.599-600. The Director's recalculations are based on actual crop water need up to that point and a revised Forecast Supply, among other things. *Id.*

Step 8 addresses the obligations of junior water users after the Director makes his in-season recalculations and adjustments. These obligations generally trigger when Coalition members have exhausted their storage water rights to where all that remains in the reservoirs is an amount of water equal to their reasonable carryover. The Director refers to this as the "Time of Need."[7] Step 8 provides:

> Step 8: At the Time of Need, junior ground water users are required to provide the lesser of the two volumes from Step 4 (May 1 secured water) and the

[6] Junior water users will have previously mitigated for any reasonable carryover shortfall from the previous year under step 9 of the *Methodology Order*. 382 R., pp.600-601.

[7] The *Methodology Order* provides that "[t]he calendar day determined to be the Time of Need is established by predicting the day in which the remaining storage allocation will be equal to reasonable carryover, or the difference between the 06/08 average demand and the 02/04 supply. The Time of Need will not be earlier than the Day of Allocation." 382 R., p.584 fn.9.

area of common water supply. The Director's decision in this respect is set aside and remanded for further proceedings as necessary.

H. The Coalition's argument that mitigation water for material injury to reasonable carryover must be provided up front has previously been addressed and will not be revisited.

With respect to the issue of mitigation of material injury to reasonable carryover, the Coalition argues that the *Methodology Order* is contrary to Idaho law in that it does not require the transfer of actual mitigation water to the Coalition's storage space up front to "carryover" for use in future years. This Coalition's argument in this respect has previously been addressed and rejected. In Gooding County Case No. CV-2008-551, the district court held that as long as assurances are in place, such as an option for water, that mitigation water could be acquired and transferred the following irrigation season, then junior users need not transfer that mitigation water up front to be carried over:

> In this regard, although the Director adopted a "wait and see" approach, the Director did not require any protection to assure senior right holders that junior ground water users could secure replacement. ... *This does not mean that juniors must transfer replacement water in the season of injury,* however, the CMR require that assurances be in place such that replacement water can be acquired and will be transferred in the event of a shortage. An option for water would be such an example. Seniors can therefore plan for the future the same as if they have the water in their respective accounts and juniors may avoid the threat of curtailment.

Order on Petition for Judicial Review, Gooding County Case No. CV-2008-551, p.19 (July 24, 2009) (emphasis added). Given that the decision of the district court in this respect was not overturned by the Idaho Supreme Court in the *2013 SWC Case*, this Court sees no reason to revisit the issue. The Director's decision in this respect is affirmed.

I. The *Methodology Order's* process for determining reasonable carryover does not violate the CM Rules.

The CM Rules provide that in determining reasonable carryover, "the Director shall consider the average annual rate of fill of storage reservoirs and the average annual carry-over for prior comparable water conditions and the projected water supply for the system." IDAPA 37.03.11.042.g. The Coalition argues that the Director's *Methodology Order* fails to consider

these factors in its process for determining reasonable carryover, and asks this Court to set aside and remand the same. Section III of the *Methodology Order* sets forth the Director's methodology for determining material injury to reasonable carryover. 382 R., pp.585-590. A review of Section III reveals that the Director does consider and analyze, consistent with CM Rule 42.g, the projected water supply, average annual rate of fill and average annual carryover of the Coalition members. The *Methodology Order* first considers the projected water supply. 382 R., pp.585-586. It uses the values of Heise Gage natural flow data for the years 2002 and 2004 to establish a projected typical dry year supply as the projected water supply. 382 R., p.585. In so doing, the Director notes that "[t]he Heise natural flow, for the years 2002 and 2004, were well below the long term average . . . ." *Id.* The *Methodology Order* then considers and sets forth the annual percent fill of storage volume by Coalition members from 1995 to 2008. 382 R., pp.586-587. Last, the *Methodology Order* considers and sets forth actual average carryover of Coalition members from 1995-2008. 382 R., pp.587-588.

The CM Rules do not limit the Director's determination of reasonable carryover to consideration of the factors enumerated in CM Rule 42.g, but only require that the Director consider those enumerated factors. The Court finds based on a review of the *Methodology Order* that the Director's process for determination reasonable carryover does consider the enumerated factors. Therefore, the Court finds that the Director's process was reached through an exercise of reason, is within the limits of his discretion and must be affirmed.

J. Step 10 of the *Methodology Order* is set aside and remanded for further proceedings.

The Coalition argues that the transient modeling provision of step 10 of the *Methodology Order* is contrary to law. Step 10 provides in part as follows:

> As an alternative to providing the full volume of reasonable carryover shortfall established in Step 9, junior ground water users can request that the Department model the transient impacts of the proposed curtailment based on the Department's water rights data base and the ESPA Model. The modeling effort will determine total annual reach gain accruals due to curtailment over the period of the model exercise. In the year of injury, junior ground water users would then be obligated to provide the accrued volume of water associated with the first year of the model run. In each subsequent year, junior ground water users would be required to provide the respective volume of water associated with reach gain accruals for that respective year, until such time as the reservoir storage space held by members of the SWC fills, or the entire volume of water from Step 9 less any previous accrual payments is provided.

382 R., p.601 (internal citations omitted). The Director justifies his determination in this respect as follows:

> Because of the uncertainty associated with this prediction, and in the interest of balance priority of right with optimum utilization and full economic development of the State's water resources, Idaho Const. Art. XV, § 3; Idaho Const. Art. XV, § 7; Idaho Code § 42-106; Idaho Code § 42-226, the Director will use the ESPA Model to simulate transient curtailment of the projected reasonable carryover shortage.

382 R., pp.596-597. For reasons stated elsewhere in this decision (see Section V.A.ii above), the Court finds that the articles and code sections relied upon by the Director do not justify his decision. The Department acknowledges as much in its briefing, providing that "the Director did not have the benefit of the guidance in *Clear Springs* and the 2012 and 2013 *A&B* decisions when the *Methodology Order* was issued."[13] *Corrected Brief of Respondents*, p.68. The Department thus suggests that "a remand to the Director with instructions to apply the Idaho Supreme Court's guidance is the appropriate remedy if this Court determines that the *Methodology Order* does not provide an adequate explanation of the basis for the transient modeling provision of Step 10." *Id.*

This Court agrees that the transient modeling provision of step 10 must be set aside and remanded for further proceedings. Counsel for the Department argues that the provision is supported by the CM Rules' provisions for phased-in curtailment. However, this justification was not contemplated or detailed by the Director in the *Methodology Order*. Rather, it is being raised for the first time on judicial review. The Court does question the viability of phased curtailment as a justification for the practice outlined in step 10. Reasonable carryover is surface water "which is retained or stored for future use in years of drought or low-water." *AFRD#2*, 143 Idaho at 878, 154 P.3d at 449. As the *Methodology Order* is currently constituted, the out-of-priority use resulting in the material injury to the Coalition's reasonable carryover will have already occurred by the time the Director reaches step 10 of the *Methodology Order*. It is questionable whether after-the-fact phased curtailment, as contemplated by the CM Rules, would be consistent with Idaho law or satisfies the purpose of reasonable carryover. For the reasons set

[13] Counsel refers to the Idaho Supreme Court's decisions in *Clear Springs Foods, Inc. v. Spackman*, 150 Idaho 790, 252 P.3d 71 (2011), *A&B Irr. Dist. v. Idaho Dept. of Water Resources*, 153 Idaho 500, 284 P.3d 225 (2012), and *In the Matter of Distribution of Waters to Various Water Rights Held by or for the Benefit of A&B Irr., Dist.*, 155 Idaho 640, 315 P.3d 828 (2013), respectively.

forth in this section, the transient modeling provision of step 10 will be set aside and remanded for further proceedings as necessary.

K. The *Methodology Order's* procedures for determining Coalition members' reasonable in-season demand are consistent with Idaho law.

The City of Pocatello and IGWA both argue that the Director's methodology for determining the Coalition's reasonable in-season demand, as set forth in the *Methodology Order*, are contrary to law. They assert several arguments in support of their position. Each will be addressed in turn.

i. The Director did not act contrary to law or abuse his discretion in considering the Coalition's historic use in determining reasonable in-season demand.

The primary argument asserted by IGWA and the City of Pocatello is that the *Methodology Order* unlawfully considers the Coalition's historic use in initially determining reasonable in-season demand. As discussed above, the Director uses a historic demand baseline analysis that utilizes the values of 2006 and 2008 to arrive at an average baseline year for purposes of the initial reasonable in-season demand determination. 382 R., p.574. However, the *Methodology Order* also provides that the initial reasonable in-season demand determination "will be corrected during the season to account for variations in climate and water supply between the BLY and actual conditions." 382 R., p.568. Further, that "[g]iven the climate and system operations for the year being evaluated will likely be different from the BLY, the BLY must be adjusted for those differences." 382 R., p.575. The Director's consideration of the Coalition's historic use in this context is not contrary to law. The Idaho Supreme Court has already affirmed "the Director's use of *a predicted baseline of a senior water right holders' needs* as a starting point in considering the material injury issue in a water call." *2013 SWC Case*, 155 Idaho at 656, 315 P.3d at 844 (emphasis added). Therefore, the Court finds that the *Methodology Order's* use of a baseline analysis as the starting point in determining the Coalition's reasonable in-season demand is not contrary to law.

In conjunction with their argument, the City of Pocatello and IGWA assert that the *Methodology Order's* process for determining reasonable in-season demand fails to consider

various contemporary factors. IGWA argues that it fails to consider acres that are no longer irrigated, crop needs, water diverted by the Coalition for use by others, and water leased by the Coalition to other water users. IGWA and the City of Pocatello additionally argue that it fails to consider certain factors listed in CMR Rule 42, including the rate of diversion compared to the acreage of land served, the annual volume of water diverted, the system diversion and conveyance efficiency, and the method of irrigation water application. This Court disagrees.

A review of the *Methodology Order* reveals that the Director's calculation of reasonable in-season demand provides for the consideration of all the factors raised by IGWA and the City of Pocatello. For instance, the Director's consideration of project efficiency and crop water need includes the following:

> Monthly irrigation entity diversion ("Q_D") will be obtained from Water District 01's diversion records. Ex. 8000, Vol. II, at 8-4, 8-5. *Raw monthly diversion values will then be adjusted to remove any water diversions that can be identified to not directly support the beneficial use of crop development within the irrigation entity.* Examples of adjustments include the removal of diversions associated with in-season recharge *and diversion of irrigation water on the behalf of another irrigation entity.* Adjustments, as they become known to the Department, will be applied during the mid-season updates and in the reasonable carryover shortfall calculation. Examples of adjustments that can only be accounted for later in the season include SWC deliveries for flow augmentation, SWC Water placed in the rental pool, and SWC private leases. *Adjustments are unique to each irrigation season and will be evaluated each year. Any natural flow or storage water deliveries to entities other than the SWC for purposes unrelated to the original right will be adjusted so that the water is not included as a part of the SWC water supply or carryover volume.* Water that is purchased or leased by a SWC member may become part of IGWA's shortfall obligation; to the extent that member has been found to have been materially injured. . . . *Conversely, adjustments will be made to assure that water supplied to private leases or to the rental pool will not increase the shortfall obligation.*

382 R., p.578 (emphasis added). Therefore, the Court finds that the *Methodology Order* takes into consideration acres that are no longer irrigated, crop needs, water diverted by the Coalition for use by others, and water leased by the Coalition to other water users. Furthermore, both the Hearing Officer and the Director found, in considering the Rule 42 factors, that the Coalition members operate reasonable and efficient irrigation projects. The Director found that "as found by the hearing officer in his recommended order, members of the SWC operate reasonably and without waste," and that he will not "impose greater project efficiencies upon members of the SWC than have been historically realized." 382 R., p.551; 551 R., pp.7102-7104.

In conjunction with IGWA's and the City of Pocatello's argument in this respect, it is necessary to reiterate the presumptions and evidentiary standards that apply to a delivery call. *See e.g., 2013 SCW Case*, 155 Idaho at 650, 315 P.3d at 838 (providing, "when utilizing the baseline in the administration context, the Director must abide by established evidentiary standards, presumptions, and burdens of proof"). First, when a call is made "the presumption under Idaho law is that the senior is entitled to his decreed water right." *AFRD#2*, 143 Idaho at 878, 154 P.3d at 449. Then, "[o]nce a decree is presented to an administrating agency or court, all changes to that decree, permanent or temporary, must be supported by clear and convincing evidence." *A&B Irr., Dist.*, 153 Idaho at 524, 284 P.3d at 249. Finally, "[o]nce the initial determination is made that material injury is occurring *or will occur*, the junior then bears the burden of proving that the call would be futile or to challenge, in some other constitutionally permissible way, the senior's call." *AFRD#2*, 143 Idaho at 878, 154 P.3d at 449 (emphasis added).

These presumptions and evidentiary standards are instructive on this issue. The *Methodology Order* provides for the Director's consideration of the factors with which IGWA and the City of Pocatello are concerned. However, if the junior users believe for some reasons that the seniors will receive water they cannot beneficially use, it is their burden under the established evidentiary standards and burdens of proof to prove that fact by clear and convincing evidence. For example, the juniors may assert that the Director in their opinion is considering some, but not *all* acres that are no longer irrigated by the seniors. Or it may be their opinion that the Director is considering some, but not *the full extent* of water diverted by the seniors for use by others. In that scenario, it is then their burden under the established evidentiary standards and burdens of proof get evidence supporting their position before the Director in an appropriate fashion.

ii. The Director did not abuse his discretion or act contrary to law in declining to adopt a water budget methodology to determine the Coalition's water needs.

IGWA and the City of Pocatello argue that the Director's *Methodology Order* should have adopted a water budget methodology to determine the water needs of the Coalition. At the hearing before the Hearing Officer, the parties each proposed a water budget methodology for

determining the water needs of the Coalition. The Director declined to adopt any such methodology, favoring instead the use of a baseline demand analysis as the starting point in determining reasonable in-season demand. 382 R., pp.575-577. The Director's decision in this respect is supported by law, the record, and is within his discretion.

The Idaho Supreme Court has already affirmed "the Director's use of a predicted baseline of a senior water right holders' needs as a starting point in considering the material injury issue in a water call." *2013 SWC Case*, 155 Idaho at 656, 315 P.3d at 844. Furthermore, the Director's reasoning for declining to adopt a water budget method is supported by the record. The record establishes that both the Hearing Officer and the Director questioned the validity of using a water budget methodology under the facts and circumstances presented, recognizing the wildly differing results reached by the surface water and ground water experts under such an approach. In addressing the issue, the Hearing Officer stated:

> The irony in this case is that surface water and ground water expert testimony used much of the same information and in some respects the same approaches and came up with a difference of 869,000 acre-feet for an average diversion budget analysis of SWC districts for the period from 1990 through 2006. . . . The total under the SWC analysis is 3,274,948 acre-feet as compared to the Pocatello analysis of . . . 2,405,861[acre-feet].

551 R., p.7096. The Hearing Officer concluded that such results do "not promote much faith in the science of the water budget analysis," and declined to adopt any of the presented water budget approaches. 551 R., pp.7096-7097. The Director echoed these sentiments in his *Methodology Order* when making the determination to utilize a baseline methodology. 382 R., pp.576-577. As set forth in detail above, the Court finds that the Director's use of the values of 2006 and 2008 to arrive at an average baseline year for purposes of the initial reasonable in-season demand determination is supported by substantial evidence. In reviewing the Director's assessment and rejection of the water budget methodology, this Court finds that the Director's decision was reached through an exercise of reason, is within the limits of his discretion and must be affirmed.

iii. The *Methodology Order's* use of the values of 2006 and 2008 to arrive at an average baseline year for purposes of the initial reasonable in-season demand determination is not contrary to law.

The City of Pocatello and IGWA allege that the *Methodology Order* impermissibly overestimates the reasonable in-season demand of the Coalition. They point to the Director's use of the values of 2006 and 2008 to arrive at an average baseline year for purposes of a reasonable in-season demand determination. They assert that the Director's use of those values results in the selection of a baseline year of above average temperatures and evapotranspiration and below average precipitation, which in turn impermissibly results in overestimated reasonable in-season demand. It is their position that the Director must determine the needs of the Coalition based on historic use data associated with a year with average temperatures, evapotranspiration and precipitation. This Court disagrees.

The Director's adoption of a baseline year intentionally utilizes above average temperatures and evapotranspiration and below average precipitation. In selecting a baseline year, Director notes that "demand for irrigation water typically increases in years of higher temperature, higher evapotranspiration ("ET"), and lower precipitation." 382 R., p.569. He then explains that it is necessary to select a baseline year of above average temperatures and evapotranspiration and below average precipitation in order to protect senior rights:

> Equality in sharing the risk will not adequately protect the senior priority surface water right holder from injury. The incurrence of actual demand shortfalls by a senior surface water right holder resulting from pre-irrigation season predictions based on average data *unreasonably shifts the risk of shortage to the senior surface water right holder*. Therefore, a BLY should represent a year(s) of above average diversions, and should avoid years of below average diversions. An above average diversion year(s) selected as the BLY should also represent a year(s) of above average temperatures and ET, and below average precipitation to ensure that increased diversions were a function of crop water need and not other facts.

382 R., pp.569-570 (emphasis added). In his *Methodology Order*, the Director found that "using the values of 2006 and 2008 (06/08) to arrive at an average BLY fits the selection criteria for all members of the SWC." 382 R., p.574.

The Director did not err in his intentional adoption of a baseline year based on above average temperatures and evapotranspiration and below average precipitation. The Court agrees that use of such data is necessary to protect senior rights if the Director is going to administer to an amount less than the full decreed quantity of the Coalition's rights. The arguments set forth by the City of Pocatello and IGWA that the Director must use data associated with an average year fail to take into account the legal limitations placed on the Director in responding to a

delivery call. The senior is entitled to a presumption under Idaho law that he is entitled to his decreed water right. *AFRD#2*, 143 Idaho at 878, 154 P.3d at 449. If the Director is going to administer to less than the full quantity of the decreed water right, his decision must be supported by clear and convincing evidence in order to adequately protect the senior right. *A&B Irr. Dist.*, 153 Idaho at 524, 284 P.3d at 249.

If the Director determined the needs of the Coalition based on historic use data associated with an average year, any decision to administer to less than the full quantity of the Coalition's decreed rights based on that data would not adequately protect its senior rights. Using data associated with an average year by its very definition would result in an under-determination of the needs of the Coalition half of the time. The Director simply cannot rely upon such data if he is going to administer to less than the decreed quantity of the Coalitions' water rights as his analysis would not be supported by clear and convincing evidence.

The City of Pocatello and IGWA additionally argue that the Director's use of the values of 2006 and 2008 violates the law of case. Specifically, they argue that the use of such data violates the Hearing Officer's recommendation, which they interpret as requiring use of data associated with an average year. Whether this interpretation of the Hearing Officer's recommendation is accurate need not be addressed. What is important is that after the Hearing Officer issued his *Recommendation*, but before the Director issued his *Methodology Order*, case law developed instructing the Director concerning the significance of a decreed water right in a delivery call. *Memorandum Decision and Order on Petition for Judicial Review*, Minidoka County Case No. 2009-647 (May 4, 2010). In that case, the district court held that if the Director determines to administer to less than the decreed quantity of water, such a determination must be supported by clear and convincing evidence. *Id.* at 38. The Director in issuing his *Methodology Order* was bound to follow this case law.[14] As set forth above, using data associated with an average year in order to administer to less than the full decreed quantity of the Coalitions' water rights would not meet a clear and convincing evidence standard. Therefore, the arguments set forth by IGWA and the City of Pocatello are unavailing.

[14] The district court's decision in this regard was ultimately affirmed by the Idaho Supreme Court on appeal. *A&B Irr. Dist. v. Idaho Dept. of Water Resources*, 153 Idaho 500, 284 P.3d 225 (2012).

L. The *Methodology Order's* procedures for determining water supply are consistent with Idaho law.

IGWA and the City of Pocatello additionally argue that the Director wrongly underestimates the forecasted water supply in the *Methodology Order*. The *Methodology Order* explains that in determining water supply "[t]he actual natural flow volume that will be used in the Director's Forecast Supply will be one standard error below the regression line, which underestimates the available supply." 382 R., p.582. Further,

> By using one standard error of estimate, the Director purposefully underestimates the water supply that is predicted in the Joint Forecast. . . . The Director's prediction of material injury to RISD is purposefully conservative. While it may ultimately be determined after final accounting that less water was owed than was provided, this is an appropriate burden for the juniors to carry. Idaho Const. Art. XV, § 3, Idaho Code § 42-106.

382 R., p.594. IGWA and the City of Pocatello argue that the Director's intentional underestimation of the forecasted water supply is an abuse of discretion and contrary to Idaho law. This Court disagrees for the reasons set forth in the preceding section regarding the Director's use of the values of 2006 and 2008 to arrive at an average baseline year for purposes of the initial reasonable in-season demand determination. The analysis set forth in that preceding section is incorporated herein by reference. The Court finds that the Director did not abuse his discretion or act contrary to law in finding that the use of one standard error below the regression line is necessary to protect senior rights if the Director is going to administer to an amount less than the full decreed quantity of the Coalition's rights. The Court finds that the Director's decision to utilize such a regression analysis was reached through an exercise of reason, is within the limits of his discretion and must be affirmed.

M. Neither the City of Pocatello nor IGWA were denied due process.

The City of Pocatello and IGWA argue that the Director denied them due process by declining to allow them to present evidence challenging the *Methodology Order* after his issuance of that *Order*. This Court disagrees. Idaho Code Section 42-1701A provides in part that "any person aggrieved by any action of the director, including any decision, determination, order or other action . . . who is aggrieved by the action of the director, and who has not previously been afforded an opportunity for a hearing on the matter shall be entitled to a hearing

before the director to contest the action." In this case, the City of Pocatello and IGWA were previously afforded an opportunity for hearing. On January 16, 2008, a hearing was commenced before the Hearing Officer that resulted in the development and issuance of the *Methodology Order*. 551 R., p.7382. For approximately fourteen days, evidence and testimony was presented to the Hearing Officer by the parties, including IGWA and the City of Pocatello. Both IGWA and Pocatello had the opportunity at that hearing to present their theories and testimony on how material injury to the Coalition should be determined. Among other things, those parties had the opportunity to present their water budget analysis, which was rejected by the Hearing Officer and Director for reasons stated in the record. After considering the parties' evidence and arguments, the Director adopted the methodology for determining material injury set forth in the *Methodology Order*. The question of whether the *Methodology Order's* process for determining material injury is contrary to law, or inconsistent with the record, is a matter for judicial review. This Court has taken up those arguments in this decision. As a result, the IGWA and the City of Pocatello are not entitled to the relief they seek on this issue.

VI.
ANALYSIS OF METHODOLOGY AS APPLIED

The Director issued his *Methodology Order* in June 2010. Since that time, the Director has issued several final orders applying his methodology to subsequent water years. Those final orders have resulted in the filing of a number of *Petitions* seeking judicial review of the Director's applications.

A. The Director's application of the *Methodology Order* in 2013 failed to adjust the mitigation obligations of the juniors to take into account changing conditions.

The Coalition argues that the Director's application of the *Methodology Order* in 2013 was contrary to law. On April 17, 2013, the Director issued his *Final Order Regarding April 2013 Forecast Supply (Methodology Steps 1-4)*. 382 R., pp.829-846. In that *Order*, the Director concluded that the Twin Falls Canal Company would experience material injury to reasonable in-season demand in the amount of 14,200 acre-feet. 382 R., p.831. He also determined that the rest of the Coalition members would experience no material injury to reasonable in-season

Under step 3, the Director makes his initial determination of water supply. Step 3 occurs after the United States Bureau of Reclamation ("USBOR") and the United States Corps of Engineers ("USACE") issue their Joint Forecast predicting unregulated inflow volume at the Heise Gage. 382 R., p.598. The Joint Forecast is typically released within the first two weeks of April. *Id.* Thereafter, the Director issues an April Forecast Supply for the water year. *Id.* The Director also determines in step 3 whether a demand shortfall to any member of the Coalition will occur in the coming season. *Id.* Demand shortfall is the difference between reasonable in-season demand and the April Forecast Supply. *Id.* If reasonable in-season demand is greater that the April Forecast Supply, a demand shortfall exists. *Id.*

Under step 4, if the demand shortfall is greater than the reasonable carryover shortfall from the previous year,[6] material injury exists or will exist, and junior users are required to establish their ability to mitigate that injury to avoid curtailment. 382 R., pp.598-599. To mitigate, junior users only need establish their ability to secure mitigation water to be provided to the Coalition at a later date, which the Director refers to as the "Time of Need." The Director then makes adjustments to his calculations throughout the irrigation season as conditions develop. These adjustments are provided for in steps 6 and 7 of the *Methodology Order*, which provide that at various times throughout the irrigation season, the Director will recalculate reasonable in-season demand and adjust demand shortfall for each member of the Coalition. 382 R., pp.599-600. The Director's recalculations are based on actual crop water need up to that point and a revised Forecast Supply, among other things. *Id.*

Step 8 addresses the obligations of junior water users after the Director makes his in-season recalculations and adjustments. These obligations generally trigger when Coalition members have exhausted their storage water rights to where all that remains in the reservoirs is an amount of water equal to their reasonable carryover. The Director refers to this as the "Time of Need."[7] Step 8 provides:

> Step 8: At the Time of Need, junior ground water users are required to provide the lesser of the two volumes from Step 4 (May 1 secured water) and the

[6] Junior water users will have previously mitigated for any reasonable carryover shortfall from the previous year under step 9 of the *Methodology Order*. 382 R., pp.600-601.

[7] The *Methodology Order* provides that "[t]he calendar day determined to be the Time of Need is established by predicting the day in which the remaining storage allocation will be equal to reasonable carryover, or the difference between the 06/08 average demand and the 02/04 supply. The Time of Need will not be earlier than the Day of Allocation." 382 R., p.584 fn.9.

Under step 3, the Director makes his initial determination of water supply. Step 3 occurs after the United States Bureau of Reclamation ("USBOR") and the United States Corps of Engineers ("USACE") issue their Joint Forecast predicting unregulated inflow volume at the Heise Gage. 382 R., p.598. The Joint Forecast is typically released within the first two weeks of April. *Id.* Thereafter, the Director issues an April Forecast Supply for the water year. *Id.* The Director also determines in step 3 whether a demand shortfall to any member of the Coalition will occur in the coming season. *Id.* Demand shortfall is the difference between reasonable in-season demand and the April Forecast Supply. *Id.* If reasonable in-season demand is greater that the April Forecast Supply, a demand shortfall exists. *Id.*

Under step 4, if the demand shortfall is greater than the reasonable carryover shortfall from the previous year,[6] material injury exists or will exist, and junior users are required to establish their ability to mitigate that injury to avoid curtailment. 382 R., pp.598-599. To mitigate, junior users only need establish their ability to secure mitigation water to be provided to the Coalition at a later date, which the Director refers to as the "Time of Need." The Director then makes adjustments to his calculations throughout the irrigation season as conditions develop. These adjustments are provided for in steps 6 and 7 of the *Methodology Order*, which provide that at various times throughout the irrigation season, the Director will recalculate reasonable in-season demand and adjust demand shortfall for each member of the Coalition. 382 R., pp.599-600. The Director's recalculations are based on actual crop water need up to that point and a revised Forecast Supply, among other things. *Id.*

Step 8 addresses the obligations of junior water users after the Director makes his in-season recalculations and adjustments. These obligations generally trigger when Coalition members have exhausted their storage water rights to where all that remains in the reservoirs is an amount of water equal to their reasonable carryover. The Director refers to this as the "Time of Need."[7] Step 8 provides:

> Step 8: At the Time of Need, junior ground water users are required to provide the lesser of the two volumes from Step 4 (May 1 secured water) and the

[6] Junior water users will have previously mitigated for any reasonable carryover shortfall from the previous year under step 9 of the *Methodology Order*. 382 R., pp.600-601.

[7] The *Methodology Order* provides that "[t]he calendar day determined to be the Time of Need is established by predicting the day in which the remaining storage allocation will be equal to reasonable carryover, or the difference between the 06/08 average demand and the 02/04 supply. The Time of Need will not be earlier than the Day of Allocation." 382 R., p.584 fn.9.

Under step 3, the Director makes his initial determination of water supply. Step 3 occurs after the United States Bureau of Reclamation ("USBOR") and the United States Corps of Engineers ("USACE") issue their Joint Forecast predicting unregulated inflow volume at the Heise Gage. 382 R., p.598. The Joint Forecast is typically released within the first two weeks of April. *Id.* Thereafter, the Director issues an April Forecast Supply for the water year. *Id.* The Director also determines in step 3 whether a demand shortfall to any member of the Coalition will occur in the coming season. *Id.* Demand shortfall is the difference between reasonable in-season demand and the April Forecast Supply. *Id.* If reasonable in-season demand is greater that the April Forecast Supply, a demand shortfall exists. *Id.*

Under step 4, if the demand shortfall is greater than the reasonable carryover shortfall from the previous year,[6] material injury exists or will exist, and junior users are required to establish their ability to mitigate that injury to avoid curtailment. 382 R., pp.598-599. To mitigate, junior users only need establish their ability to secure mitigation water to be provided to the Coalition at a later date, which the Director refers to as the "Time of Need." The Director then makes adjustments to his calculations throughout the irrigation season as conditions develop. These adjustments are provided for in steps 6 and 7 of the *Methodology Order*, which provide that at various times throughout the irrigation season, the Director will recalculate reasonable in-season demand and adjust demand shortfall for each member of the Coalition. 382 R., pp.599-600. The Director's recalculations are based on actual crop water need up to that point and a revised Forecast Supply, among other things. *Id.*

Step 8 addresses the obligations of junior water users after the Director makes his in-season recalculations and adjustments. These obligations generally trigger when Coalition members have exhausted their storage water rights to where all that remains in the reservoirs is an amount of water equal to their reasonable carryover. The Director refers to this as the "Time of Need."[7] Step 8 provides:

> Step 8: At the Time of Need, junior ground water users are required to provide the lesser of the two volumes from Step 4 (May 1 secured water) and the

[6] Junior water users will have previously mitigated for any reasonable carryover shortfall from the previous year under step 9 of the *Methodology Order*. 382 R., pp.600-601.

[7] The *Methodology Order* provides that "[t]he calendar day determined to be the Time of Need is established by predicting the day in which the remaining storage allocation will be equal to reasonable carryover, or the difference between the 06/08 average demand and the 02/04 supply. The Time of Need will not be earlier than the Day of Allocation." 382 R., p.584 fn.9.

until August 27, 2013. 382 R., pp.948-957. The Coalition argues the Director's delay in applying step 6 required its members to make water delivery decisions for the remainder of the irrigation season without the benefit of the revised forecast and any related mitigation obligation. The Coalition argues the Director acted arbitrarily and capriciously by delaying the application of step 6. This Court agrees.

The Director identifies the "irrigation season" as running from "the middle of March to the middle of November - an eight month span." 382 R., p. 1039. Therefore, mid-July is halfway through the irrigation season. The word "approximately" is defined as "almost correct or exact: close in value or amount but not precise." *See e.g.* www. merriam-webster.com /dictionary/ approximately. Although step 6 provides for some flexibility by not requiring the revision to be made precisely halfway through the irrigation season, a delay of close to a month and half does not even fit under a generous interpretation of the word "approximately." In this regard, the Director acted arbitrarily and capriciously. The Director should apply his established procedure as written or further define and/or refine the procedure so that Coalition members relying on the procedure know when to anticipate its application and are able to plan accordingly.

C. The Director's calculation of crop water need of the Minidoka Irrigation District, Burley Irrigation District, and the Twin Falls Canal Company in 2013, as set forth in his *Order Revising April 2013 Forecast Supply (Methodology Steps 6-8)* is set aside and remanded for further proceedings as necessary.

The Coalition asserts that the Director has erroneously refused to use certain irrigated acreage information provided by it when determining its crop water need under steps 1 and 2 of the *Methodology Order*. The Coalition's argument focuses primarily on the 2013 water year. Step 1 of the *Methodology Order* requires the Coalition "to provide electronic shape files to the Department delineating the total irrigated acres within their water delivery boundary or confirm in writing that the existing electronic shape file from the previous year has not varied by more than 5%" on or before April 1. 382 R., p.597. Step 2 provides that starting at the beginning of April, the Department will calculate the cumulative crop water need volume for all land irrigated with surface water within the boundaries of each member of the SWC. *Id.* It further provides that volumetric values of crop water need will be calculated "using ET and precipitation values

5. On July 29, 2010, pursuant to the unopposed request of the parties, the Court entered an *Order* consolidating the six *Petitions for Judicial Review* into Gooding County Case No. CV-2010-382 ("Consolidated 382 Case").

6. On September 17, 2010, the Director issued his *Final Order Revising April 2010 Forecast Supply (Methodology Step 7)*. 382 R., pp.636-645. A *Petition* seeking judicial review of that *Final Order* was filed by the Coalition in Twin Falls County Case No. CV-2010-5520. The *Petition* was reassigned to this Court.

7. On November 30, 2010, the Director issued his *Final Order Establishing 2010 Reasonable Carryover (Methodology Step 9)*. 382 R., pp.684-692. A *Petition* seeking judicial review of that *Final Order* was filed by the Coalition in Twin Falls County Case No. CV-2010-5946. The *Petition* was reassigned to this Court.

8. On December 13, 2010, the Court issued an *Order* staying proceedings in the Consolidated 382 Case pending the Idaho Supreme Court's issuance of its written decision in Idaho Supreme Court Docket No. 38193-2010. The stay was entered pursuant to the request and agreement of the parties.

9. On January 3, 2011, pursuant to the unopposed request of the parties, the Court entered an *Order* consolidating the Coalition's *Petitions* in Twin Falls County Case Nos. CV-2010-5520 and 2010-5946 into consolidated the Consolidated 382 Case.

10. On April 13, 2012, the Director issued his *Final Order Regarding April 2012 Forecast Supply (Methodology Steps 1-8)*. 382 R., pp.728-742. On May 9, 2012, the Director issued his *Order Denying Petition for Reconsideration; Denying Motion to Authorize Discovery; Denying Request for Hearing (Methodology Steps 1-8)*. 382 R., pp.753-757. A *Petition* seeking judicial review of that *Final Order* and *Order Denying Petition for Reconsideration* was filed by the Coalition in Twin Falls County Case No. CV-2012-2096. The *Petition* was reassigned to this Court.

11. On April 17, 2013, the Director issued his *Final Order Regarding April 2013 Forecast Supply (Methodology 1-4)*. 382 R., pp.829-846. On May 22, 2013, the Director issued his *Order Denying Petition for Reconsideration; Denying Request for Hearing; Denying Motion to Authorize Discovery (Methodology Steps 1-4)*. 382 R., pp.888-893. A *Petition* seeking judicial review of that *Final Order* and *Order Denying Petition for Reconsideration* was filed by

delivery call. The senior is entitled to a presumption under Idaho law that he is entitled to his decreed water right. *AFRD#2*, 143 Idaho at 878, 154 P.3d at 449. If the Director is going to administer to less than the full quantity of the decreed water right, his decision must be supported by clear and convincing evidence in order to adequately protect the senior right. *A&B Irr. Dist.*, 153 Idaho at 524, 284 P.3d at 249.

If the Director determined the needs of the Coalition based on historic use data associated with an average year, any decision to administer to less than the full quantity of the Coalition's decreed rights based on that data would not adequately protect its senior rights. Using data associated with an average year by its very definition would result in an under-determination of the needs of the Coalition half of the time. The Director simply cannot rely upon such data if he is going to administer to less than the decreed quantity of the Coalitions' water rights as his analysis would not be supported by clear and convincing evidence.

The City of Pocatello and IGWA additionally argue that the Director's use of the values of 2006 and 2008 violates the law of case. Specifically, they argue that the use of such data violates the Hearing Officer's recommendation, which they interpret as requiring use of data associated with an average year. Whether this interpretation of the Hearing Officer's recommendation is accurate need not be addressed. What is important is that after the Hearing Officer issued his *Recommendation*, but before the Director issued his *Methodology Order*, case law developed instructing the Director concerning the significance of a decreed water right in a delivery call. *Memorandum Decision and Order on Petition for Judicial Review*, Minidoka County Case No. 2009-647 (May 4, 2010). In that case, the district court held that if the Director determines to administer to less than the decreed quantity of water, such a determination must be supported by clear and convincing evidence. *Id.* at 38. The Director in issuing his *Methodology Order* was bound to follow this case law.[14] As set forth above, using data associated with an average year in order to administer to less than the full decreed quantity of the Coalitions' water rights would not meet a clear and convincing evidence standard. Therefore, the arguments set forth by IGWA and the City of Pocatello are unavailing.

[14] The district court's decision in this regard was ultimately affirmed by the Idaho Supreme Court on appeal. *A&B Irr. Dist. v. Idaho Dept. of Water Resources*, 153 Idaho 500, 284 P.3d 225 (2012).

iv. The Director may require use of reasonable carryover pursuant to a properly enacted mitigation plan that contains appropriate contingency provisions to protect senior rights.

In conjunction with step 8, if the Director determines a greater volume of water is necessary than the previously determined to address material injury to reasonable in-season demand, the ability of junior users to secure additional in-season water during what is typically the most water intensive stage of the irrigation season is problematic. Further problematic is that curtailment at that stage would not only have a devastating impact on junior users but may not timely provide sufficient water to the Coalition. Accordingly, curtailment may still not prevent the Coalition from relying on its reasonable carryover to help get through the remainder of the irrigation season. Nonetheless, a viable mitigation plan is still possible.

In conjunction with a properly enacted and approved mitigation plan, the Director could require the Coalition to rely on its reasonable carryover provided that: 1) existing carryover storage allocations meet or exceed the additional shortfall to the revised reasonable in-season demand; and 2) junior users secure a commitment at that time for a volume of water equal to the shortfall to the revised reasonable in-season demand to be provided the following season if necessary. This could be accomplished through an option or lease to provide water. The water would provide mitigation for any shortfalls to reasonable carryover determined to exist at the end of the season. If no shortfall is determined to exist due to changing conditions, then the option or lease need not be exercised. If a shortfall is determined to exist, then the option or lease is in place to be exercised in whole or in part as required to mitigate for any shortfall. The water would be secured but not have to be provided until such time as it can be determined whether or not the storage allocations will fill next season. This process eliminates the risk of the Director not being able to compel junior users to secure water at the end of the season in lieu of curtailment the following season. And, curtailment the following season may not provide sufficient water in storage to remedy the injury to storage, particularly if curtailment will also be required as a result of a demand shortfall to reasonable in-season demand the following season.

The process is consistent with the requirement set forth in the *2013 SWC Case* "that out-of-priority diversions only be permitted pursuant to a properly enacted mitigation plan." *2013 SWC Case*, 155 Idaho at 653, 315 P.3d at 841. It also eliminates the problem of securing water that will not be put to beneficial use because the water is being secured for the next season and

iv. The Director may require use of reasonable carryover pursuant to a properly enacted mitigation plan that contains appropriate contingency provisions to protect senior rights.

In conjunction with step 8, if the Director determines a greater volume of water is necessary than the previously determined to address material injury to reasonable in-season demand, the ability of junior users to secure additional in-season water during what is typically the most water intensive stage of the irrigation season is problematic. Further problematic is that curtailment at that stage would not only have a devastating impact on junior users but may not timely provide sufficient water to the Coalition. Accordingly, curtailment may still not prevent the Coalition from relying on its reasonable carryover to help get through the remainder of the irrigation season. Nonetheless, a viable mitigation plan is still possible.

In conjunction with a properly enacted and approved mitigation plan, the Director could require the Coalition to rely on its reasonable carryover provided that: 1) existing carryover storage allocations meet or exceed the additional shortfall to the revised reasonable in-season demand; and 2) junior users secure a commitment at that time for a volume of water equal to the shortfall to the revised reasonable in-season demand to be provided the following season if necessary. This could be accomplished through an option or lease to provide water. The water would provide mitigation for any shortfalls to reasonable carryover determined to exist at the end of the season. If no shortfall is determined to exist due to changing conditions, then the option or lease need not be exercised. If a shortfall is determined to exist, then the option or lease is in place to be exercised in whole or in part as required to mitigate for any shortfall. The water would be secured but not have to be provided until such time as it can be determined whether or not the storage allocations will fill next season. This process eliminates the risk of the Director not being able to compel junior users to secure water at the end of the season in lieu of curtailment the following season. And, curtailment the following season may not provide sufficient water in storage to remedy the injury to storage, particularly if curtailment will also be required as a result of a demand shortfall to reasonable in-season demand the following season.

The process is consistent with the requirement set forth in the *2013 SWC Case* "that out-of-priority diversions only be permitted pursuant to a properly enacted mitigation plan." *2013 SWC Case*, 155 Idaho at 653, 315 P.3d at 841. It also eliminates the problem of securing water that will not be put to beneficial use because the water is being secured for the next season and

iv. The Director may require use of reasonable carryover pursuant to a properly enacted mitigation plan that contains appropriate contingency provisions to protect senior rights.

In conjunction with step 8, if the Director determines a greater volume of water is necessary than the previously determined to address material injury to reasonable in-season demand, the ability of junior users to secure additional in-season water during what is typically the most water intensive stage of the irrigation season is problematic. Further problematic is that curtailment at that stage would not only have a devastating impact on junior users but may not timely provide sufficient water to the Coalition. Accordingly, curtailment may still not prevent the Coalition from relying on its reasonable carryover to help get through the remainder of the irrigation season. Nonetheless, a viable mitigation plan is still possible.

In conjunction with a properly enacted and approved mitigation plan, the Director could require the Coalition to rely on its reasonable carryover provided that: 1) existing carryover storage allocations meet or exceed the additional shortfall to the revised reasonable in-season demand; and 2) junior users secure a commitment at that time for a volume of water equal to the shortfall to the revised reasonable in-season demand to be provided the following season if necessary. This could be accomplished through an option or lease to provide water. The water would provide mitigation for any shortfalls to reasonable carryover determined to exist at the end of the season. If no shortfall is determined to exist due to changing conditions, then the option or lease need not be exercised. If a shortfall is determined to exist, then the option or lease is in place to be exercised in whole or in part as required to mitigate for any shortfall. The water would be secured but not have to be provided until such time as it can be determined whether or not the storage allocations will fill next season. This process eliminates the risk of the Director not being able to compel junior users to secure water at the end of the season in lieu of curtailment the following season. And, curtailment the following season may not provide sufficient water in storage to remedy the injury to storage, particularly if curtailment will also be required as a result of a demand shortfall to reasonable in-season demand the following season.

The process is consistent with the requirement set forth in the *2013 SWC Case* "that out-of-priority diversions only be permitted pursuant to a properly enacted mitigation plan." *2013 SWC Case*, 155 Idaho at 653, 315 P.3d at 841. It also eliminates the problem of securing water that will not be put to beneficial use because the water is being secured for the next season and

It is against these legal presumptions, burdens of proof, and evidentiary standards that the Director's *Methodology Order* must be analyzed. In the *Methodology Order*, the Director recognizes that "[i]f the Director predicts that the SWC will be materially injured, the consequence of that prediction is an obligation that must be borne by junior ground water users." 382 R., p.593. And, that:

> By requiring that junior ground water users provide of have options to acquire water in place during the season of need, the Director ensures that the SWC does not carry the risk of shortage to their supply. By not requiring junior ground water users to provide mitigation water until the time of need, the Director ensures that junior ground water users provide only the amount of water necessary to satisfy the reasonable in-season demand.

Id. The Court finds that the Director's analysis in this respect protects senior rights in times of shortage by appropriately accounting for the legal presumptions, burdens of proof, and evidentiary standards required by Idaho law. Therefore, the Court finds that the Director's decision in this respect was reached through an exercise of reason, is within the limits of his discretion and must be affirmed.

The City of Pocatello next argues that in determining the reasonable in-season demand of the Coalition in his 2010 *As-Applied Order*, the Director failed to account for all water diverted by Coalition members for delivery to other entities (i.e., wheeled water). The *Methodology Order* provides that in calculating the Coalition's reasonable in-season demand, "any natural flow or storage water deliveries to entities other than the SWC for purposes unrelated to the original right will be adjusted so that the water is not included as a part of the SWC water supply or carryover volume." 382 R., p.578. The City argues that the Director erroneously failed to subtract all wheeled water from the Coalition's reasonable in season demand calculations. This Court disagrees. The City relies on Exhibit 3000 from the hearing on the *As-Applied Order* in 2010. That exhibit provides that "Wheeled water transactions for A&B, AFRD2, Minidoka, and TFCC *may have occurred*, but values were less than 1% of total demand and therefore were not considered." 382 Ex. 3000, *Hearing on the As-Applied Order*. That exhibit only establishes that wheeled water transactions "may have occurred." The fact that such transaction may have occurred is not is not sufficient if the Director is going to use that data to administer to less than the full amount of the Coalition's decreed rights. *A&B Irr. Dist.*, 153 Idaho at 524, 284 P.3d at 249 (holding, "Once a decree is presented to an administrating agency or court, all changes to

5. On July 29, 2010, pursuant to the unopposed request of the parties, the Court entered an *Order* consolidating the six *Petitions for Judicial Review* into Gooding County Case No. CV-2010-382 ("Consolidated 382 Case").

6. On September 17, 2010, the Director issued his *Final Order Revising April 2010 Forecast Supply (Methodology Step 7)*. 382 R., pp.636-645. A *Petition* seeking judicial review of that *Final Order* was filed by the Coalition in Twin Falls County Case No. CV-2010-5520. The *Petition* was reassigned to this Court.

7. On November 30, 2010, the Director issued his *Final Order Establishing 2010 Reasonable Carryover (Methodology Step 9)*. 382 R., pp.684-692. A *Petition* seeking judicial review of that *Final Order* was filed by the Coalition in Twin Falls County Case No. CV-2010-5946. The *Petition* was reassigned to this Court.

8. On December 13, 2010, the Court issued an *Order* staying proceedings in the Consolidated 382 Case pending the Idaho Supreme Court's issuance of its written decision in Idaho Supreme Court Docket No. 38193-2010. The stay was entered pursuant to the request and agreement of the parties.

9. On January 3, 2011, pursuant to the unopposed request of the parties, the Court entered an *Order* consolidating the Coalition's *Petitions* in Twin Falls County Case Nos. CV-2010-5520 and 2010-5946 into consolidated the Consolidated 382 Case.

10. On April 13, 2012, the Director issued his *Final Order Regarding April 2012 Forecast Supply (Methodology Steps 1-8)*. 382 R., pp.728-742. On May 9, 2012, the Director issued his *Order Denying Petition for Reconsideration; Denying Motion to Authorize Discovery; Denying Request for Hearing (Methodology Steps 1-8)*. 382 R., pp.753-757. A *Petition* seeking judicial review of that *Final Order* and *Order Denying Petition for Reconsideration* was filed by the Coalition in Twin Falls County Case No. CV-2012-2096. The *Petition* was reassigned to this Court.

11. On April 17, 2013, the Director issued his *Final Order Regarding April 2013 Forecast Supply (Methodology 1-4)*. 382 R., pp.829-846. On May 22, 2013, the Director issued his *Order Denying Petition for Reconsideration; Denying Request for Hearing; Denying Motion to Authorize Discovery (Methodology Steps 1-4)*. 382 R., pp.888-893. A *Petition* seeking judicial review of that *Final Order* and *Order Denying Petition for Reconsideration* was filed by

VII.

REMAINING *FINAL ORDERS*

The Coalition filed *Petitions* seeking judicial review of the Director's *Final Order Revising April 2010 Forecast Supply (Methodology Step 7)*, dated September 17, 2010, *Final Order Establishing 2010 Reasonable Carryover (Methodology Step 9)*, dated November 30, 2010, and *Order Releasing IGWA from 2012 Reasonable Carryover Shortfall Obligation (Methodology Step 5)*, dated June 13, 2013. The Coalition provided no briefing or argument specific to these *Final Orders* on judicial review. However, through these *Final Orders* the Director applied his methodology as set forth in the *Methodology Order*. To the extent these *Final Orders* applied the *Methodology Order* in a manner inconsistent with this Court's analysis and holdings regarding the *Methodology Order* as set forth herein, they are set aside and remanded for further proceedings as necessary.

VIII.

CONCLUSION AND ORDER OF REMAND

For the reasons set forth above, the actions taken by Director in this matter are affirmed in part and set aside in part. The case is remanded for further proceedings as necessary consistent with this decision.

IT IS SO ORDERED.

Dated September 26, 2014

ERIC J. WILDMAN
District Judge

CERTIFICATE OF MAILING

I certify that a true and correct copy of the MEMORANDUM DECISION AND ORDER ON PETITIONS FOR JUDICIAL REVIEW was mailed on September 26, 2014, with sufficient first-class postage to the following:

Report Text

Section 1.0

P. 1, Paragraph 1, Line 6: Deleted text "The Fifth Methodology Order amends and replaces the Fourth Methodology Order that was issued in 2016."

P. 1, Paragraph 2, Line 1: Added text "The SWC members divert from the Snake River between Lake Walcott and Milner Dam under mostly senior natural flow water rights. They also have storage contracts in various upstream Bureau of Reclamation reservoirs. The following are the SWC members:

- A&B Irrigation District ("A&B")
- American Falls Reservoir District #2 ("AFRD2")
- Burley Irrigation District ("BID")
- Milner Irrigation District ("Milner")
- Minidoka Irrigation District ("Minidoka")
- North Side Canal Company ("NSCC")
- Twin Falls Canal Company ("TFCC")"

P. 1, Paragraph 3, Line 1: Added text "A more detailed summary of the SWC natural flow water rights and storage contracts is contained in SWE's 2007 expert report prepared for the 2008 hearing for the SWC delivery call (SWE 2007a)."

P. 2, Paragraph 1, Line 1: "The Fifth Methodology Order made" should read "The Fifth Methodology Order amends and replaces the Fourth Methodology Order that was issued in 2016, and makes"

P. 2, Bullet 3, Line 2: "Aquifer Groundwater Model" should read "Aquifer Model"

P. 2, Paragraph 2, Line 1: "Hearing Officer Schroeder's ruling" should read "April 29, 2008, Order from Hearing Officer Schroeder (former Chief Justice of the Idaho Supreme Court)"

P. 3, Paragraph 4, Line 3: "April-As Applied" should read "April As-Applied"

P. 3, Paragraph 2, Line 5: "technical working groups" should read "technical working groups ("TWG")"

P. 3, Paragraph 2, Line 7: "Technical Working Group ("TWG")" should read "TWG"

P. 4, Bullet 1, Line 5: "A&B Irrigation District, American Falls Reservoir District #2, Burley Irrigation District, Milner Irrigation District, Minidoka Irrigation District,

North Side Canal Company, and Twin Falls Canal Company ["SWC"]" should read "the SWC"

P. 4, Bullet 6, Line 2: "Idaho Department of Resources" should read "Idaho Department of Water Resources"

Section 2.0

P. 6, Paragraph 2, Line 1: "The IDWR supports the average combined SWC diversions during 2000-2021 of 3,200,389 AF described in paragraph 27 and the reported backup file is the diversion data" should read "The IDWR support for the average combined SWC diversions during 2000-2021 of 3,200,389 AF in paragraph 27 is provided in a backup file of diversion data"

P. 6, Paragraph 3, Line 2: "Fourth Methodology" should read "Fourth Methodology Order"

P. 6, Paragraph 3, Line 3: "show" should read "shows"

P. 6, Paragraph 5, Line 1: Deleted text "difference between"

P. 7, Paragraph 4, Line 6: Added text "(Idaho 1903)"

Section 3.0

P. 8, Paragraph 1, Line 9: "IDWRIDWR" should read "IDWR"

P. 10, Paragraph 1, Line 1: "systems." should read "systems (blue line)."

P. 10, Paragraph 4, Line 6: "2008" should read "2008,"

P. 12, Paragraph 1, Line 4: Deleted text "also"

P. 12, Paragraph 1, Line 7: "It is not expected that the SWC members would at times operate at lower efficiencies than the reasonable values" should read "The SWC members may at times operate at lower efficiencies than the reasonable values when water supplies are plentiful"

P. 12, Paragraph 1, Line 10: "than" should read "that"

P. 13, Section Header, Line 1: "Fifth Methodology" should read "Fifth Methodology Order"

P. 13, Paragraph 1, Line 4: "Firth" should read "Fifth"

P. 16, Paragraph 1, Line 5: "shortfall" should read "shortfalls"

Section 4.0

P. 17, Paragraph 1, Line 1: "April 29, 2008," should read "2008"

P. 17, Paragraph 1, Line 1: Deleted text "(former Chief Justice of the Idaho Supreme Court)"

P. 17, Paragraph 2, Line 2: "IGW A" should read "IGWA"

P. 17, Paragraph 2, Line 4: "of75,152" should read "of 75,212"

P. 18, Inset Table:	Added highlights to methodology acres column for Burley, Minidoka, and TFCC
P. 18, Paragraph 3, Line 1:	Added text “for Burley, Minidoka, and TFCC”
P. 18, Paragraph 3, Line 2:	“proposed to be used” should read “used”

Section 6.0

P. 22, Paragraph 3, Line 1:	“right” should read “rights”
P. 22, Paragraph 4, Line 1:	“The Fifth Methodology asserts that it must now update” should read “IDWR now asserts in the Fifth Methodology Order that it must”
P. 22, Paragraph 4, Line 2:	“has” should read “it has”
P. 22, Paragraph 4, Line 3:	“halfmonth time step” should read “calibration using monthly stress periods and halfmonth time steps”
P. 23, Paragraph 2, Line 1:	“The Fifth Methodology asserts” should read “IDWR asserts in the Fifth Methodology Order”
P. 23, Paragraph 6, Line 1:	“The halfmonth timestep has” should read “Monthly stress period and halfmonth time steps have”
P. 23, Paragraph 6, Line 1:	“ESPAM 2.1” should read “ESPAM”
P. 23, Paragraph 6, Line 2:	“is not a new refinement” should read “are not new refinements”
P. 23, Paragraph 6, Line 2:	“Even with prior versions of ESPAM understanding the impact difference between steady-state modeling verses transient modeling was well understood by me and all members of the ESPAM modeling committee including the Department who frequently discussed and evaluated the different versions of the model.” should read “Prior to ESPAM 2.1, the differences between steady-state modeling and transient modeling were well understood by IDWR and the ESHMC members and were frequently discussed during meetings.”
P. 23, Paragraph 8, Line 3:	“the pre-moratorium” should read “pumping by pre-moratorium wells”
P. 24, Paragraph 1, Line 2:	“November 28, 2022” should read “November 28, 2022,”
P. 25, Paragraph 5, Line 4:	“November 28, 2022” should read “November 28, 2022,”

Section 7.0

P. 27, Bullet 3, Line 2:	“arbitrary, capricious, and unrealistic” should read “arbitrary and unreasonable”
P. 27, Bullet 3, Line 4:	“considered” should read “considered in computing the average annual diversions”
P. 27, Bullet 4, Line 2:	“monthly project efficiencies have declined.” should read “project efficiencies of most SWC members have declined.”

P. 27, Bullet 5, Line 1:	"conversions, advancements" should read "conversions and advancements"
P. 27, Bullet 5, Line 2:	Deleted text ", and reductions in irrigated area due to development and urbanization"
P. 27, Bullet 6, Line 1:	"Low" should read "Lower"
P. 28, Bullet 9, Line 1:	"show" should read "during the last 15 years show"
P. 28, Bullet 11, Line 1:	"crop" should read "SWC diversion"
P. 28, Bullet 12, Line 7:	Added text "The monthly efficiency values for September should be used for October."

Section 8.0

P. 30, Paragraph 1, Line 1:	Added text "The following information was relied upon in preparing this expert report."
P. 30, Paragraph 4, Line 1:	Added text "Idaho. 1903. Contract Between Idaho State Board of Land Commissioners and Twin Falls Land and Water Company. January 2, 1903."
P. 32, Paragraph 1, Line 4:	Added text ", and all references listed therein"
P. 32, Paragraph 3, Line 4:	Added text ", and all references listed therein"
P. 32, Paragraph 4, Line 1:	Added text "Sullivan, 2008a. Spronk Water Engineers, Inc. Expert Report Dated July 16, 2008 Prepared for the City of Pocatello. In the Matter of the Petition for Delivery Call of A&B Irrigation District for Delivery of Ground Water and for the Creation of a Ground Water Management Area, and all references listed therein."
P. 32, Paragraph 5, Line 1:	Added text "Sullivan, 2008b. Spronk Water Engineers, Inc. Expert Rebuttal Report Dated August 27, 2008 Prepared for the City of Pocatello. In the Matter of the Petition for Delivery Call of A&B Irrigation District for Delivery of Ground Water and for the Creation of a Ground Water Management Area, and all references listed therein."
P.32, Paragraph 6, Line 1:	Added text "Sullivan, 2008c. Spronk Water Engineers, Inc. Expert Sur-Rebuttal Report Dated September 16, 2008 Prepared for the City of Pocatello. In the Matter of the Petition for Delivery Call of A&B Irrigation District for Delivery of Ground Water and for the Creation of a Ground Water Management Area, and all references listed therein."

1.0 INTRODUCTION

On April 21, 2023, the Director of the Idaho Department of Water Resources ("IDWR") issued the *Fifth Amended Final Order Regarding Methodology for Determining Material Injury To Reasonable In-Season Demand and Reasonable Carryover* ("Fifth Methodology Order") describing procedures for IDWR's administration of a delivery call by the Surface Water Coalition ("SWC") that was originally placed in 2005 and has been administered ever since under what is generically referred to herein as the "SWC Methodology."

The SWC members divert from the Snake River between Lake Walcott and Milner Dam under mostly senior natural flow water rights. They also have storage contracts in various upstream Bureau of Reclamation reservoirs. The following are the SWC members:

- A&B Irrigation District ("A&B")
- American Falls Reservoir District #2 ("AFRD2")
- Burley Irrigation District ("BID")
- Milner Irrigation District ("Milner")
- Minidoka Irrigation District ("Minidoka")
- North Side Canal Company ("NSCC")
- Twin Falls Canal Company ("TFCC")

A more detailed summary of the SWC natural flow water rights and storage contracts is contained in SWE's 2007 expert report prepared for the 2008 hearing for the SWC delivery call (SWE 2007a).

On April 21, 2023, the IDWR Director also issued the *Final Order Regarding April 2023 Forecast Supply (Methodology Steps 1-3)* ("April As-Applied Order") describing the Director's implementation of Steps 1-3 of the Fifth Methodology Order in forecasting in-season water supply shortages to the SWC members in 2023. Based on the forecast shortages, the Director ordered that groundwater rights with priority dates junior to December 30, 1953, that are not part of an effectively operating mitigation plan will be subject to curtailment beginning on May 5, 2023.

Finally on April 21, 2023, the IDWR Director issued a *Notice of Hearing, Notice of Prehearing Conference, and Order Authorizing Discovery* that set a hearing on the SWC Methodology for June 6-10, 2023, in Boise, Idaho. According to a subsequent order on May 2, 2023, the deadline for submittal of expert reports from the parties is seven days before the first day of the hearing, which would be May 30, 2023.

The Fifth Methodology Order amends and replaces the Fourth Methodology Order that was issued in 2016, and makes several substantive changes to the SWC Methodology including the following:

- Change in the Baseline Year used to forecast the SWC member demands from an average of the member diversions during 2006, 2008, and 2012 to instead use the member diversions during 2018.
- Changes in the monthly project efficiencies for the SWC members that are used to compute monthly diversion demands for prior months when the shortage computations are updated mid-season (July), at the time of need, and after the irrigation season (November).
- Change in how the priority date for curtailment of groundwater rights is determined using the Eastern Snake Plain Aquifer Model ("ESPAM") from using steady-state curtailment runs to using transient curtailment runs.

It has been over 15 years since the 2008 hearing and April 29, 2008, Order from Hearing Officer Schroeder (former Chief Justice of the Idaho Supreme Court) that resulted in the Second Methodology Order issued in 2010. That was the last time the SWC Methodology was significantly scrutinized, and there are now 15 years of actual operating experience available to evaluate how the SWC Methodology has functioned. In addition, there have been numerous changed conditions over the last 15 years that may have affected surface water and groundwater use in the Upper Snake River Basin including the following:

- Urbanization of formerly irrigated parcels,
- Continued gravity to sprinkler conversions,
- Changes in crops,
- Canal lining,
- Advancements in remote sensing,
- Improved irrigation management,
- More and better measurements of water distribution and water use,
- More automation of irrigation facilities,
- Delivery of mitigation supplies to SWC members,
- Changes in WD01 accounting procedures, and
- Changes in WD01 rental pool rules.

Given these changed conditions and the substantive changes to the SWC Methodology included in the Fifth Methodology Order, now is an appropriate time to review all aspects of the SWC Methodology to determine whether the SWC members are operating with reasonable efficiencies and without waste, the SWC members are protected from material injury due to junior groundwater pumping, the groundwater users are protected

from excessive or undue curtailment and mitigation obligations, and the beneficial uses of the interconnected surface water and groundwater resources of the Snake River and the ESPA are maximized.

This expert report was prepared on behalf of the following entities who successfully petitioned to intervene in the SWC Methodology matter ("ESPA Cities"):

- City of Idaho Falls,
- City of Pocatello, and
- Coalition of Cities[1].

A map showing the locations of the ESPA Cities, the service area boundaries of the SWC members, and the ESPA Area of Common Groundwater is attached as **Figure 1-1**.

The compressed schedule established by the Director to complete discovery and prepare expert reports left insufficient time to perform all of the necessary work to thoroughly review the Fifth Methodology Order, the April As-Applied Order, and the historical operations of the SWC members during the last 15 years. The time limitations have necessitated that this report focus on certain key elements of the Fifth Methodology Order and eschew the more thorough review and analysis of the order that I would have performed had more time been made available prior to the expert report deadline and June hearing. Each section of this expert report describes my review, analysis, and expert opinions on a selected element of the Fifth Methodology Order. In addition to this expert report, I prepared and submitted two declarations in support of pre-hearing motions filed by the ESPA Cities. One of those declarations contains additional details regarding my prior work on the SWC Delivery Call and related matters.

My involvement in the SWC Delivery Call extends back to the original delivery call made by the SWC in 2005. In response to that delivery call, I compiled extensive data and analyzed the operations of the SWC irrigation systems. This included several weeks in the field observing diversion and conveyance facilities, irrigated farms, and irrigation application methods. In addition, I was present at the depositions of managers and staff of each of the SWC members regarding irrigation system operations, system losses and efficiencies, record keeping, and other related matters. Based on this information, I prepared analyses of the historical irrigation operations of each SWC member over the

[1] The Coalition of Cities includes the Cities of Bliss, Burley, Carey, Declo, Dietrich, Gooding, Hazelton, Heyburn, Jerome, Paul, Richfield, Rupert, Shoshone, and Wendell.

period from 1990 – 2006. The results of my work were documented in several expert reports and testimony presented at an IDWR hearing in February 2008.

Since the 2008 hearing regarding the SWC delivery call, I have reviewed the various amended methodology orders and the various as-applied orders concerning the SWC Methodology that have been issued over the years. In May 2010, I participated in a hearing on revisions to the SWC Methodology proposed by IDWR and testified at the hearing. I have also been involved in two technical working groups ("TWG") convened by IDWR to discuss potential changes to the SWC Methodology. The first was in early 2015 and the second in late 2022. I submitted comments to IDWR and the TWG in both instances.

I am incorporating into this Expert Report by reference the following expert reports and other information previously presented to IDWR and other parties:

- Franzoy, 2007. Franzoy Consulting, Inc. Expert Rebuttal Report Prepared in Rebuttal to Analyses and Conclusions of Experts for the Surface Water Coalition Dated November 7, 2007. Prepared for the City of Pocatello. In the Matter of the Request of Administration in Water District 120 and the Request for Delivery of Water to Senior Surface Water Rights by the SWC.
- Sullivan, 2007a. Spronk Water Engineers, Inc. Updated Expert Report Dated September 26, 2007 (revised December 2007). Prepared for the City of Pocatello. In the Matter of the Request of Administration in Water District 120 and the Request for Delivery of Water to Senior Surface Water Rights by the SWC.
- Sullivan, 2007b. Direct testimony of Gregory K, Sullivan, P.E. September 26, 2007 (Revised December 2007). Submitted on behalf of the City of Pocatello. In the Matter of Distribution of Water to Various Water Rights Held by or for the Benefit of the SWC.
- Sullivan, 2007c. Spronk Water Engineers, Inc. Expert Rebuttal Report. November 7, 2007 (Revised December 2007). Prepared for the City of Pocatello. In the Matter of the Request of Administration in Water District 120 and the Request for Delivery of Water to Senior Surface Water Rights by the SWC.
- Sullivan, 2015. Email to IDWR. Pocatello Comments on Draft Staff Memo. March 10, 2015.
- Sullivan and Netter, 2023. Spronk Water Engineers, Inc. Comments on behalf of the Coalition of Cities and the City of Pocatello on the Idaho Department of Water Resources Summary of Recommended Technical Revisions to the 4th Amended Final Order Regarding Methodology for Determining Material Injury to

Reasonable In-Season Demand and Reasonable Carryover for the Surface Water Coalition, by Kara Ferguson and Matt Anders on December 23, 2022. Comments Submitted on January 1, 2023.

- Sullivan, 2023a. Declaration of Gregory K, Sullivan, P.E. May 7, 2023. Case No. CM-DC-2010-0001.
- Sullivan, 2023b. Declaration of Gregory K, Sullivan, P.E. May 7, 2023. Case No. CM-DC-2010-001.

I stand by, reaffirm, and endorse my prior opinions and analyses described in the foregoing materials.

2.0 BASELINE YEAR

The Fifth Methodology Order changed the Baseline Year ("BLY") used to forecast the SWC diversion demands and reasonable carryover from the average diversions during 2006, 2008, and 2012 ("06/08/12") because the average diversions during these years reportedly no longer comply with a condition of the SWC Methodology that the BLY represent a year of above average diversions. Diversions of the SWC members reported in paragraph 27 of the Fifth Methodology Order indicated that the combined diversions of the SWC Members during 06/08/12 averaged 3,194,722 AF, which is 5,667 AF (0.18%) less than the combined diversions during 2000-2021 that averaged 3,200,389 AF. Annual diversions for the SWC members during 2000-2021 from the materials disclosed by Matt Anders (IDWR) during his deposition are summarized in **Table 2-1**.

The IDWR support for the average combined SWC diversions during 2000-2021 of 3,200,389 AF in paragraph 27 is provided in a backup file of diversion data disclosed by Matt Anders (IDWR) during his May 2023 deposition. However, the 06/08/12 average combined SWC diversions from the same data file are different than the figures reported in paragraph 27. The updated 06/08/12 combined diversions average 3,200,349 AF, which is only 40 AF (0.001%) less than the 2000-2021 average diversions.

The 06/08/12 average diversions in paragraph 27 are from the Fourth Methodology Order. Comparison of the backup data for the Fourth Methodology Order with the data disclosed by Mr. Anders shows that IDWR made some revisions to the prior data used for the Fourth Methodology Order. To be consistent, the same data should be used to compute and compare the 06/08/12 average and the 2000-2021 average.

To be sure, 3,200,349 AF is less than 3,200,389 AF, and so the 06/08/12 average is mathematically below average. However, this difference is insignificant and de minimis. Assuming a typical irrigation season from April 1 through October 31 (214 days), the combined diversions of the SWC members average approximately 15,000 AF/day. Therefore, the 40 AF that the 06/08/12 average diversions are below the 2000-2021 average represents less than five minutes of the combined amount that the SWC members divert on average.

The 40 AF that the 06/08/12 average diversions is below the 2000-2021 average is much less than the accuracy of the measuring flumes for the SWC member canals. Assuming the measurement accuracy of the SWC measuring devices is +/- 5%, the combined measurement error would be approximately 160,000 AF/year, which dwarfs the 40 AF that the 06/08/12 average diversions are below the 2000-2021 average. The Director's determination that the 06/08/12 average diversions no longer meet the above average

criteria appears arbitrary, and there is no clear and convincing evidence that this is the case.

Finally, the 22-year period from 2000-2021 that was used to compute the average diversions of the SWC members arbitrarily and conspicuously does not include the most recent year of diversion data, 2022. If the diversion data from 2022 are included, the average combined diversion for 2000-2022 is 3,189,818 AF, which is 10,530 AF less than the 06/08/12 average of 3,200,349 AF. In other words, the 06/08/12 average diversions are above the 2000-2022 average, and based on this comparison, 06/08/12 should still qualify as an above average figure.

The Director selected 2018 as the new BLY for the SWC Methodology because it reportedly met all of the BLY criteria, including being a year of above average diversions. The combined SWC member diversions during the proposed 2018 BLY (3,341,939 AF) are approximately 142,000 AF greater than the 06/08/12 average diversions (3,200,349 AF). So, the 40 AF (5,667 AF uncorrected) that the 06/08/12 average diversions are below the 2000-2021 average will translate into a much larger increase in the BLY combined diversions. In turn, this large increase will also result in substantially greater projected shortages to the SWC members under the Fifth Methodology Order than under the Fourth Methodology Order.

Review of the data in the Anders' spreadsheet indicates that the 06/08/12 average diversions are no longer above average because the diversions of six of the seven SWC members have actually increased since the Fourth Methodology Order was issued in 2016. Furthermore, the Anders spreadsheet does not factor in that the legally established delivery rate for TFCC is one cfs for each eighty acres of land, or five-eighths of a miner's inches for each acre of land (Idaho, 1903).

The diversion averaging period used for comparison to the BLY diversions in the Fourth Methodology Order was 2000 – 2014. Average combined diversions by the SWC members during 2000 – 2014 averaged 3,154,945 AF. During the recent 2015 – 2021 period, combined diversions by the SWC members increased by an average of 142,826 AF as shown in **Table 2-1**. IDWR performed no analyses to assess the reasonableness of the increased SWC member diversions since 2014 that prompted the need to change the BLY.

3.0 PROJECT EFFICIENCIES

Following the initial forecast of the shortages to the SWC members that is made in April based on the BLY estimate of the RISD, Step 6 of the Methodology Order specifies that the RISD will be updated approximately halfway through the irrigation season (~July) using the monthly figures for each SWC member of the Crop Water Need ("CWN") and the Project Efficiency ("PE") up to that point during the irrigation season, and monthly baseline demand figures from the BLY for the remaining months. Additional updates to the RISD's and shortages of the SWC members based on CWN and PE are made shortly before the Time of Need (Step 7) and following the end of the irrigation season (Step 9). The following is the formula that IDWR uses to compute the RISD at mid-season, Time of Need, and end of season (Fifth Methodology Order P. 16):

$$RISD_{milestonex_x} = \sum_{j=1}^{m}\left(\frac{CWN_j}{E_{p.j}}\right) + \sum_{j=m+1}^{7} BD_j$$

Where:

$RISD_{milestone_x}$ = reasonable in season demand at specified evaluation milestones during the irrigation season,
CWN = crop water need for month j,
E_p = baseline project efficiency for month j,
BD = baseline demand for month j,
j = index variable, and
m = upper bound of summation, equal to the month calculation occurs, where April = 1, May =2, … October = 7.

Monthly CWN values are computed for each SWC member based on Agrimet evapotranspiration data, precipitation data, and cropping information using the following formula (Fifth Methodology Order P. 14):

$$CWN = \sum_{i=1}^{n}(ET_i - W_e)A_i$$

Where,

CWN = crop water need
ET_i = consumptive use of specific crop type,
W_e = effective precipitation,
A_i = total irrigated area of specific crop type,
i = index variable representing the different specific crop types grown within the irrigation entity, and
n = upper bound of summation equal to the total number of different specific crop types grown within the irrigation entity.

The baseline project efficiencies for the monthly RISD calculation are computed for each SWC member for each month from April – October based on historical computations of CWN and historical monthly diversions adjusted to remove water not used for irrigation and to add water leased or rented to others. The following is the formula used to compute the monthly project efficiencies (Fifth Methodology Order P. 13):

$$E_p = \frac{CWN}{Q_D}$$

Where:

E_p = project efficiency,
CWN = crop water need, and
Q_D = irrigation entity diversion of water specifically put to beneficial use for the growing of crops within the irrigation entity.

In the Fourth Methodology Order, monthly project efficiencies for each SWC member for the preceding 8 years that were within two standard deviations of the average were averaged to compute the monthly values used in the RISD calculations. In the Fifth Methodology Order, the averaging period was changed to use data from the preceding 15 years. The following are the average monthly project efficiencies for each SWC member that will be used for the Fifth Methodology Order (P. 14):

Month	A&B	AFRD2	BID	Milner	Minidoka	NSCC	TFCC	Monthly Avg.
4	0.98	0.33	0.45	0.87	0.43	0.24	0.31	0.51
5	0.47	0.22	0.32	0.39	0.35	0.24	0.30	0.33
6	0.66	0.40	0.49	0.60	0.56	0.41	0.51	0.52

Season Avg.	0.58	0.32	0.37	0.52	0.43	0.31	0.35	

SWC Member Average Monthly Project Efficiencies from 2007-2021.[12]

Graphs illustrating monthly and annual average project efficiencies for 2007 – 2021 with values more than two standard deviations from the average removed are shown in **Figure 3-1** and **Figure 3-2**. **Figure 3-1** includes separate graphs of the monthly average efficiencies for each SWC member (solid black line) along with the seasonal average efficiency (dotted black line); both from the table in the Fifth Methodology Order. Also shown for comparison purposes is the reasonable annual efficiency for each SWC member

that I determined in 2007 as a part of my analysis of the SWC member irrigation systems (blue line). Additional discussion of the reasonable annual efficiencies is provided in Section 3.1 below.

Figure 3-2 shows the average monthly project efficiencies during 2007 – 2021 from the Fifth Methodology Order for each SWC member on the same graph. While the monthly project efficiencies for each SWC member vary from one another, the graph depicts a similar characteristic bell-shaped project efficiency curve for each SWC member. These characteristic curves are generally shifted up or down from one another due in part to differences in conveyance losses. A relatively long canal system like AFRD2 will generally have higher conveyance losses and lower project efficiencies than a relatively short canal system like A&B that will generally have lower conveyance losses and higher project efficiencies.

3.1 Reasonableness of Project Efficiencies

The monthly project efficiencies in the Fifth Methodology Order represent the actual efficiencies that result from dividing monthly CWN by monthly adjusted diversions for each SWC member. To my knowledge and per the deposition of Matthew Anders on May 12, 2023, IDWR has not attempted to assess whether the monthly project efficiencies are reasonable in comparison to industry standards for large, well-managed irrigation districts.

Reasonably attainable project efficiencies can be determined for each SWC member based on the conveyance efficiency in delivering water from the river heading to the farms (including allowances for reasonable operational waste) multiplied by a reasonable on-farm efficiency. This is essentially the procedure that IDWR used to analyze the delivery call of the Unit B pumping division of the A&B Irrigation District, and which resulted in the January 29, 2008, Order that found Unit B had not suffered injury because it was not short of water. In that analysis, IDWR determined that a reasonable project efficiency for the Unit B was 75% based on minimal conveyance losses (3.1% in 2006) and the following reported irrigation application efficiencies for sprinklers (Unit B is predominantly sprinkler irrigated):

47. Reported application efficiencies for various sprinkler irrigation systems are as follows:

Sprinkler System	Application Efficiency
stationary lateral (wheel or hand move)	60 – 75%
solid set lateral	60 – 85%
center pivot lateral	75 – 85%

Idaho Irrigation Water Conservation Task Force, 1994, p.38, and Report Regarding Evaluation of Irrigation Diversion Rates, Report to the SRBA District Court Prepared by the Idaho Department of Water Resources, January 14, 1999, p. 38.

This is also the same procedure that I employed in assessing the irrigation operations of the SWC members that is described in my expert reports and testimony presented at the 2008 hearing in the SWC Delivery Call.

Conveyance efficiencies for the SWC members are knowable and can be determined based on records of diversions and deliveries and based on the operational experience of the SWC managers and staff. Achievable on-farm irrigation efficiencies for various application methods (flood, furrow, sprinkler, drip, etc.) are also well established in the technical literature for the industry. The sprinkler efficiencies used in the A&B Order are examples of application efficiencies reported in the literature. Design irrigation application efficiencies generally represent the efficiencies that can be achieved assuming well managed irrigation systems. In my opinion, industry standard design efficiencies represent a level of performance that the SWC members should be expected to achieve before requiring curtailment of junior groundwater users because of computed irrigation water shortages.

My prior work on the SWC Delivery Call that is documented in the expert reports submitted along with testimony in 2008 found that several of the SWC members – A&B, AFRD2, Burley, Milner, and Minidoka – were generally operating with reasonable project efficiencies while others – NSCC and TFCC – were operating at less than reasonable levels.

I analyzed the operations of the SWC members during 1990 – 2006 and determined their actual project efficiencies for each year. In addition, reasonable project efficiencies were estimated based on reported conveyance efficiencies and industry standard application efficiencies weighted based on the mix of gravity and sprinkler irrigation at that time. A summary of the results from my 2007 expert report is provided in **Figure 3-3** along with averages of the monthly project efficiencies from paragraph 32 of the Fifth Methodology Order.

As seen in **Figure 3-3**, the maximum annual efficiencies of A&B, AFRD2, Burley, Milner, and Minidoka during the 1990 – 2006 period all reached the independently computed reasonable project efficiencies that were determined from analysis of the SWC systems. This validated the methodology used to determine the reasonable project efficiencies and showed that these five SWC members were capable of operating at the reasonable efficiency levels. The efficiencies lower than the maximums tended to occur in wetter years with more ample water supplies. The SWC members may at times operate at lower efficiencies than the reasonable values when water supplies are plentiful because it is generally easier to operate an irrigation system with an excess of diversions. However, the SWC should be held to a higher operational standard that they have shown they can achieve when junior groundwater users are being required to mitigate or be curtailed.

The maximum and average project efficiencies determined for NSCC and TFCC during 1990 – 2006 are well below the reasonable efficiencies determined for these two users based on their reported conveyance losses and irrigation application practices.

In my opinion, the analyses that I presented in expert reports and testimony during the 2008 Hearing on the SWC Methodology established reasonable annual project efficiencies that should be used in determining the SWC diversion requirements. These analyses showed that five of the seven SWC members had performed at the reasonable project efficiency levels, while NSCC and TFCC were operating at efficiencies well below reasonable levels. My opinions should not be construed as suggesting that the SWC members must operate at certain efficiency levels. However, when determining whether they are short of water, thus requiring mitigation or curtailment of junior groundwater users, reasonable project efficiencies using the procedures that I employed for my 2007 expert report should be used in determining the shortages.

Had there been time, I would have compiled the necessary information regarding the operations of the SWC members to update the operations analyses that I performed in 2007. Until these analyses can be updated, the reasonable project efficiency values that I determined in 2007 are reasonable for use in the SWC Methodology. This is because it is reasonable to expect that the reasonable project efficiencies for the SWC members should have increased during the last 15 years based on continued gravity to sprinkler conversions and general advancements in irrigation system operation and management.

Despite the expected advances in irrigation system efficiencies during the last fifteen years, comparison of the average project efficiencies determined by IDWR for 2007 – 2021 (black line in **Figure 3-3**) are lower than the average project efficiencies determined for 1990-2006 (red line in **Figure 3-3**). It appears that the declines in average project efficiencies since 2006 are due to these systems not being managed as well as they were in the past.

3.2 Proposed Adjustments to Fifth Methodology Order Efficiencies

If IDWR will not review and assess the reasonableness of the SWC member project efficiencies like it did in the A&B Delivery Call, and like I did in my expert reports and testimony presented in the 2008 hearing, I have developed an alternative proposal for assessing and revising the monthly project efficiencies used in the Fifth Methodology Order. This alternative builds upon the actual efficiencies that the SWC members have demonstrated they routinely achieve and conforms to the framework of the Fifth Methodology Order.

First, I offer the following opinions regarding the patterns of the actual monthly project efficiencies that are summarized in **Figure 3-1**:

- April: Efficiencies tend to be lower than mid-season efficiencies because of temporarily high conveyance losses during the initial period while the distribution system is "wetting." In addition, diversions may contribute to filling of soil moisture for crop use later in the season resulting in lower apparent efficiencies because the soil moisture filling is not included in the formula. Efficiencies are high for A&B and Milner, likely because their diversions tend to commence later in the month resulting in high CWNs use relative to diversions that are satisfied in part by soil moisture and possibly supplemental pumping.
- May: Similar to April, efficiencies tend to be lower than mid-season efficiencies because portions of the diversions are stored in soil moisture for later use. Also, spring precipitation events can reduce CWNs without a corresponding reduction in diversions.
- June-August: Efficiencies during June – August are highest when CWNs are peaking, and the systems are being operated most efficiently. The peak computed efficiencies may result from a portion of the CWNs being met from stored soil moisture and supplemental groundwater pumping.
- September: Efficiencies drop below mid-season values as CWNs decline due to harvesting and lower temperatures without a commensurate decline in diversions. In other words, the CWN declines are greater than the diversion declines.
- October: Efficiencies are typically very low because CWNs decline further due to harvesting and lower temperatures (including freezes) while relatively high diversions continue.

The low monthly average project efficiencies in April, May, September, and October can cause unreasonable spikes in the computed monthly diversion demand when the monthly

CWN is higher than average. This is because the actual efficiency in such a month would generally be higher than the monthly average value used in the demand calculation. This is demonstrated in the analyses presented below.

To further assess the project efficiencies used in the Fifth Methodology Order, graphs were prepared to assess the relationships between:

- Annual Adjusted Diversion vs. Annual CWN (**Figure 3-4**),
- Monthly Adjusted Diversion vs. Monthly CWN (**Figure 3-5 – Figure 3-11**),
- Annual Project Efficiency vs. Annual CWN (**Figure 3-12**), and
- Monthly Project Efficiency vs. Monthly CWN (**Figure 3-13 – Figure 3-19**).

The annual and monthly Adjusted Diversion vs. CWN graphs indicate that there is some correlation between adjusted diversion and CWN. The strength of the correlation indicated by the R-squared value varies by SWC member and by month. In addition to the scatter plots of adjusted diversion vs CWN, the graphs in **Figure 3-4 – Figure 3-11** also show the RISD predictor used in the Fifth Methodology Order (CWN/PE), plotted as a black line. In almost all graphs, the black line exhibits a greater slope than the linear trendline plotted through the data points. This indicates that the CWN/PE predictor is not a robust predictor of diversion demand. In many months, the monthly diversions appear relatively insensitive to changes in CWN. This is indicated in the plots with a relatively flat trendline juxtaposed with a relatively steep CWN/PE line.

The annual and monthly graphs of Project Efficiency vs. CWN in **Figure 3-12 – Figure 3-19** show moderate to strong positive correlations between project efficiency and CWN for the SWC members in many months. The months with moderate to strong PE to CWN correlations (R-squared > 50%) tend to be months with significant differences between the slopes of the diversion vs. CWN trendline and CWN/PE predictor (black line) in **Figures 3-4 through 3-10**. It generally appears that the greater the disparity between slopes of the Diversion to CWN trendline and the CWN/PE predictor, the stronger the correlation between PE and CWN. The following is a list of months for each SWC member in which this relationship exists:

- A&B – Jul, Aug, Sep, Oct;
- AFRD2 – May, Jul, Sep;
- BID – May, Jun, Aug, Sep, Oct;
- Milner – May, Oct;
- Minidoka – May, Jul, Aug, Sep, Oct;
- NSCC – May, Jun, Jul, Aug, Sep, Oct; and,
- TFCC – May, Jun, Jul, Aug, Sep, Oct.

In my opinion, months with strong PE to CWN correlations reflect months in which there tend to be over-diversions relative to the CWN. In such months, the CWN is easily met and months with greater CWN are months with greater project efficiency.

IDWR's use of fixed monthly project efficiencies for computing RISD from monthly CWN is inconsistent with the relationships in **Figures 3-13** through **3-19** that indicate for many months that project efficiencies vary with CWN. Rather than using the fixed monthly values for project efficiency in Paragraph 32 of the Fifth Methodology Order, the SWC Methodology would be improved in many months by using regression equations based on monthly CWN to compute the monthly project efficiencies that are used in the RISD calculations.

I propose that the regression equations be used in the months of April – September with R-squared values greater than 0.50. In the months in which the regression equation is used, I propose that a floor for the monthly efficiencies be specified based on the average monthly efficiency during 2007 – 2021. This will ensure that the demand calculations use monthly project efficiencies that are at or above average consistent with efficiencies that the historical operational data show they have routinely attained.

In the other May – September months with R-squared values less than 0.50, the regression equation is not a good predictor of the project efficiency. In these months, I propose that the 75th percentile efficiency be used (i.e., the value at which 25% of the monthly project efficiencies are greater). To simplify the procedure, the 75th percentile method could be used in all May – September months.

To avoid use of unreasonably low project efficiencies in October, I propose that the 75th percentile efficiency for September be used for computing the October demand for all SWC members.

The proposed revised procedure for determining the monthly project efficiencies used in computing the monthly diversion demands will result in efficiency values that are at or above the historical averages. This will help avoid unreasonably low efficiency values creating unreasonable shortages to the SWC members requiring undue mitigation or curtailment of junior groundwater users (that generally operate with relatively high irrigation efficiencies).

A hindcast analysis for TFCC and AFRD2 was performed to illustrate the effects of using alternate methods of computing project efficiencies. The project efficiencies were computed using (1) the proposed monthly averages from the Fifth Amended Methodology Order, (2) the regression equations shown on **Figure 3-14** and **Figure 3-19** limited to a minimum of the historical monthly average project efficiency, and (3) the

regression equations on **Figure 3-14** and **Figure 3-19** limited to a minimum of the 75th percentile historical monthly project efficiency. If the regression R-Squared is less than 0.5, the monthly average project efficiency was used for (2), and the 75th percentile historical monthly project efficiency was used for (3). **Table 3-1** and **Table 3-2** show the 2007 – 2021 computed demands (CWN/PE) and the November 1 RISD shortfalls using the three different project efficiency methods for TFCC and AFRD2.

In my opinion, the foregoing discussion clearly and convincingly establishes that the SWC members often operate at unreasonably low project efficiencies, particularly NSCC and TFCC. The proposed procedure will ensure to a clear and convincing standard, that (a) shortages to the SWC members will be computed only when they are operating at reasonable project efficiencies, (b) the SWC members are protected from material injury by junior groundwater pumping, (c) the groundwater users are protected from excessive or undue mitigation obligations and curtailment, and (d) the beneficial uses of the interconnected surface water and groundwater resources of the Snake River and the ESPA are maximized.

4.0 IRRIGATED AREA

The 2008 Order from Hearing Officer Schroeder in the SWC Delivery Call found that non-irrigated acres should not be included in determining the irrigation demands of the SWC members:

> *"Non-irrigated acres should not be considered in determining the irrigation supply necessary for SWC members. IGWA has established that at least 6,600 acres claimed by TFCC in its district are not irrigated. Similar information was submitted concerning the Minidoka Irrigation District, indicating that the claimed acreage of 75,152 includes 5,008 acres not irrigated and Burley Irrigation District has some 2,907 acres of the 47,622 acres claimed not irrigated. These amounts may, of course, change as acreage is removed from irrigation or possibly added back."*
> (IDWR, 2008 at P. 53)

The April As-Applied Order determined that the following acreages for the SWC members will be used to compute the monthly CWN and RISD values using the equations listed above in Section 3.0.

6. Based on the information submitted by the SWC, the Department will use the following total irrigated acres:

	Total Irrigated Acres[1]	Data Source
A&B	15,924	SRBA Partial Decree
AFRD2	62,361	SRBA Partial Decree
BID	46,035	2013 shapefile submitted by BID, reduced by Department for overlapping acres and acres outside of service area.
Milner	13,264	2010 service area shapefile, reduced by Department for overlapping acres and acres outside of service area.
Minidoka	75,093	SRBA Partial Decree
NSCC	154,067	SRBA Partial Decree
TFCC	194,732	2013 shapefile submitted by TFCC, reduced by Department for overlapping acres and acres outside of service area.

As indicated in the above table, the total irrigated area figures for the SWC members are based either on figures from their partial decrees or from shapefiles submitted to IDWR many years ago. Neither of these sources have been shown to reflect the acres actually irrigated by the SWC members.

During the meetings of the SWC TWG held in late 2022, IDWR presented analyses of the SWC member irrigated area in 2011, 2017, and 2021 with non-irrigated acres removed.

The following is a summary of the irrigated area figures that IDWR presented for the three years.

SWC Irrigated Acres

SWC Member	2011 Acres*	2017 Acres*	2021 Acres*	Methodology Acres
A&B	21,585	21,634	21,625	15,924
AFRD2	68,368	66,606	68,384	62,361
Burley	44,113	44,168	44,139	46,035
Milner	13,239	13,202	13,233	13,264
Minidoka	71,295	72,016	71,073	75,093
NSCC	220,953	218,498	220,937	154,067
TFCC	179,486	180,956	179,456	194,732

* with non-irrigated acres removed

According to deposition testimony from Matt Anders, IDWR overlaid aerial imagery from 2011, 2017, and 2021 on the irrigated area shapefiles from the SWC members and determined whether each parcel was irrigated, not irrigated, or partially irrigated. The partially irrigated parcels included hardened acres (roads, buildings, etc.) and other areas that that were not irrigated. If the non-irrigated portions of the partially irrigated parcels were removed, the 2011, 2017, and 2021 irrigated area figures would be lower than the amounts shown in the above table.

The highlighted methodology acres in the above table for Burley, Minidoka, and TFCC represent irrigated acres used in the SWC Methodology that exceed that irrigated acres determined by IDWR. Clearly, based on IDWR's own data, the highlighted methodology acres do not represent the actual irrigated areas of the SWC members. In my opinion, it would be more appropriate to use the 2021 acres for purposes of the demand calculations. The acres in 2021 are shown to be generally consistent with acreages from 2011 and 2017, all of which are less than IDWR's proposed methodology acres.

The 2021 acres for the TFCC are 15,276 acres less than the methodology acres. Based on the weighted average annual crop irrigation requirement for the TFCC over the last 20 years of approximately 2.2 AF/acre and an average project efficiency of 35%, the acreage

difference will overstate the TFCC annual demand by approximately 96,000 AF. This is more than the projected 2023 TFCC shortage of 75,200 AF in the April As-Applied Order.

5.0 SUPPLEMENTAL GROUNDWATER

According to the Fifth Supplemental Order, the use of supplemental groundwater may be considered in determining the irrigated acreage of the SWC members.

> *"In determining the total irrigated acreage, the Department may account for supplemental ground water use. The Department currently does not have sufficient information to accurately determine the contribution of supplemental ground water to lands irrigated with surface water by the SWC. If and when reliable data is available to the Department, the methodology will be amended to account for the supplemental ground water use."*
> (Fifth Methodology Order at P. 40)

IDWR has been asserting a lack of information regarding the use of supplemental groundwater by the SWC members for over ten years. The subject of supplemental groundwater use by the SWC members was raised as a concern in the SWC TWG meetings in 2015 and 2022, and the response has always been that there is not enough information.

In my 2007 expert report for the SWC Delivery Call, I summarized the supplemental groundwater acres based on information the SWC members submitted to the IDWR Director in response to his request for information. The following is the tabulation of supplemental groundwater acres that was in my 2007 report.

Table 3

Supplemental Ground Water Acreage
Surface Water Coalition
(acres)

District/Company	Acres
A&B Irrigation District	-
American Falls Reservoir District #2	11,462
Burley Irrigation District	263
Milner Irrigation District	1,890
Minidoka Irrigation District	4,650
North Side Canal Company	16,358
Twin Falls Canal Company	13,775

Source: Supplemental Response to Director's Information Request, April 15, 2005

IDWR maintains a database and shapefiles for groundwater rights and surface water rights in the state. It would be a relatively simple matter to overlay the shapefiles of the groundwater water right acreages on the shapefiles of the surface water irrigated areas for the SWC members to determine the surface water acres with access to groundwater.

In addition, IDWR now requires all ESPA groundwater pumping to be measured or estimated, so there should be pumping records available for the groundwater rights having acres that overlap the irrigated area shapefiles for the SWC members.

A reasonable mechanism could be developed to estimate the supplemental groundwater use by the SWC members. Repeated assertions that insufficient information is available to assess the use of supplemental groundwater use by the SWC members is unreasonable and is starting to ring hollow.

6.0 TRANSIENT GROUNDWATER MODELING

Until the Fifth Methodology Order, all prior methodology orders determined the priority date for curtailment of junior groundwater users because of a determination of material injury to the SWC members caused by a shortage in RISD or a shortage to reasonable carryover based on steady-state runs of the ESPAM. Repeated ESPAM runs were made simulating the impacts of pumping junior to various assumed priority dates until the annual impact at steady-state to the near Backfoot to Minidoka reach of the Snake River matched the amount of the predicted combined shortage to the SWC members.

The Fifth Methodology Order proposes a sea-change in the procedure for determining the priority date for curtailment of junior groundwater users. Instead of steady-state runs, IDWR will perform transient runs of the ESPAM to determine the priority date of curtailment. IDWR will make repeated transient runs of the ESPAM simulating the impacts of curtailing pumping junior to various assumed priority dates until the impact on the near Blackfoot to Minidoka reach between May 1 and September 30 in the first year of curtailment totals the amount of the predicted combined shortage to the SWC members.

In the April As-Applied Order, IDWR determined curtailment of groundwater rights with priority dates junior to December 30, 1953, was necessary to produce a reach gain to the near Blackfoot to Minidoka reach between May 1, 2023, and September 30, 2023, totaling 75,200 AF (forecast combined shortage to the SWC members in 2023).

IDWR now asserts in the Fifth Methodology Order that it must move from steady-state to transient modeling because it has a better understanding of applying the two different types of modeling and that the calibration using monthly stress periods and halfmonth time steps is a refinement that now allows such a change.

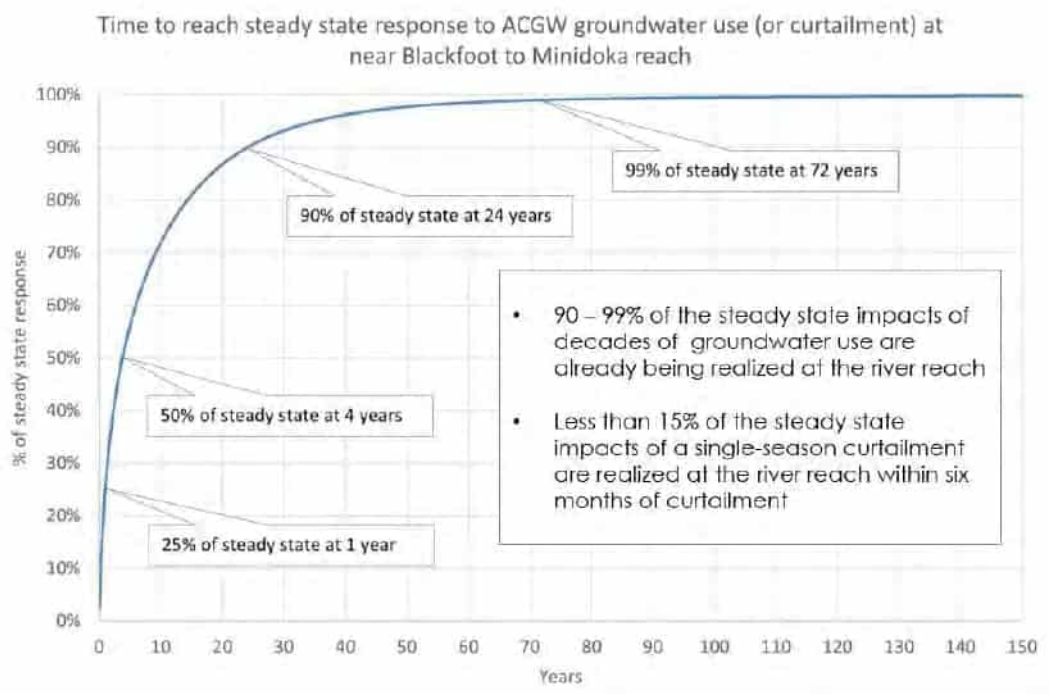
> *"Furthermore, the Department now has multiple years of experience with the methodology to better understand the impact of applying steady-state modeling versus transient modeling to determine a curtailment priority date that would supply adequate water to the senior water right holders. The first version of the ESPA groundwater flow model was not calibrated at a time-scale that supported in-season transient modeling. In contrast, the current version was calibrated using monthly stress periods and halfmonth time steps, a refinement that facilitates in-season transient modeling for calculating the response to curtailment of groundwater use. The purpose of this Fifth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover ("Fifth Methodology Order") is to update the Director's methodology for determining material injury to storage and natural flow water*

rights either held by or committed to members of the SWC consistent with the Director's ongoing obligation to use the best available science and information." (Fifth Methodology Order at P.2)".

IDWR asserts in the Fifth Methodology Order that curtailment of groundwater rights junior to a curtailment date determined based on steady-state modeling would not produce sufficient water during the first year of curtailment to offset the impact to the senior surface water rights.

> *"Only 9% to 15% of the steady state response is predicted to accrue to the near Blackfoot to Minidoka reach between May 1 and September 30 of the same year. Fifty percent of the steady-state response is predicted to accrue at the near Blackfoot to Minidoka reach within approximately four years. Ninety percent of the steady-state response is predicted to accrue at the near Blackfoot to Minidoka reach within approximately 24 years."* (Fifth Methodology Order at P. 30).

The Fifth Methodology Order cites the mechanism used for surface water administration in support of the need for transient curtailment analysis.



> *"In surface water administration, uses by holders of junior priority surface water rights are curtailed until the senior surface water rights are fully satisfied, absent a futile call and if the senior surface water users need the water to accomplish a beneficial use. In other words, under surface water administration, junior surface water rights are generally curtailed unless the senior gets water in the quantity and at the time and place required."* (Fifth Methodology Order at P. 35).

Monthly stress periods and halfmonth time steps have been part of the ESPAM model since 2013 and are not new refinements. Prior to ESPAM 2.1, the differences between steady-state modeling and transient modeling were well understood by IDWR and the ESHMC members and were frequently discussed during meetings.

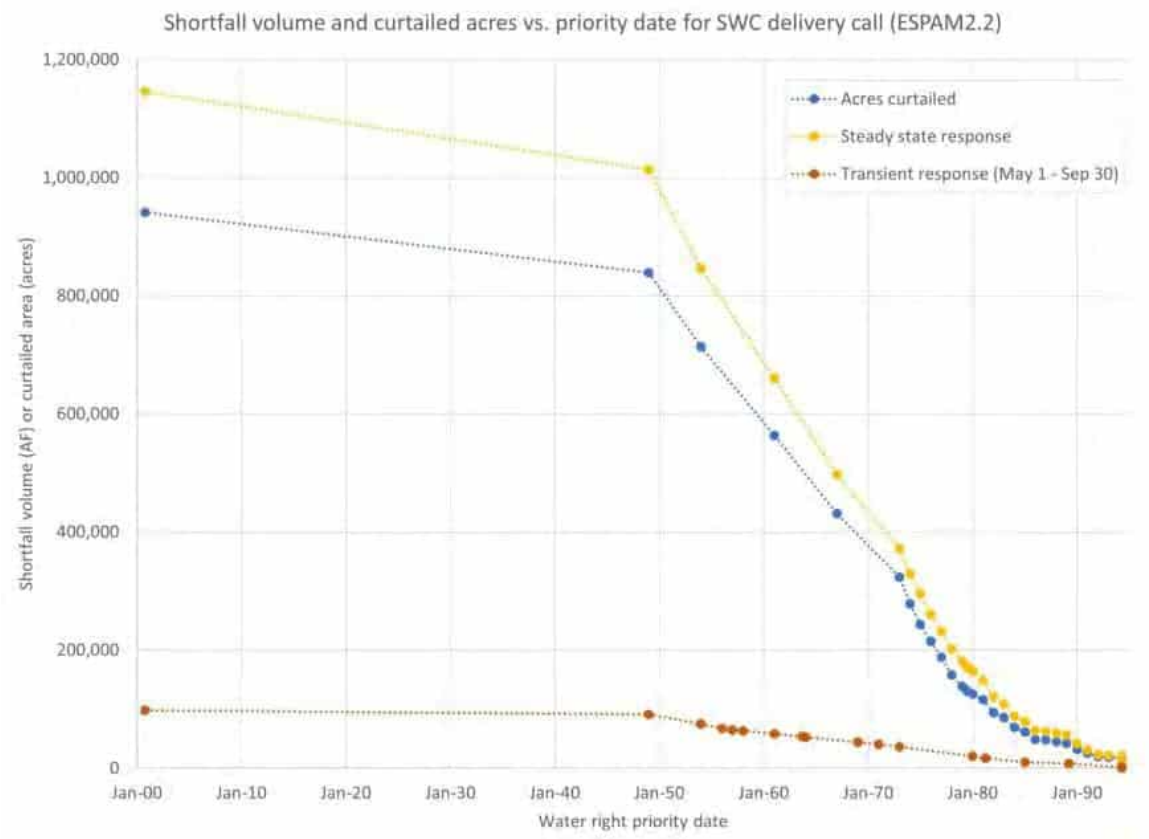
In my opinion, given the circumstances of the conjunctive administration of groundwater and surface water in the Upper Snake River Basin, use of steady-state modeling to determine the priority date of curtailment is reasonable and appropriate. In addition, as described below, administration that treats ground water rights like surface water rights (i.e., by requiring curtailment to satisfy seniors) is grossly inefficient and results in disproportionate impacts on junior ground water users.

There has been a moratorium against new groundwater development in the ESPA without mitigation since 1993. Therefore, all pre-moratorium wells have been pumping for at least 30 years, and most wells for much longer. As a result, the effects of the pumping by pre-moratorium wells on Snake River flows have reached near steady state. This is

evident in the following results of a curtailment run that was presented by Jennifer Sukow (IDWR) during the November 28, 2022, TWG meeting (Slide 6) that show the effects of ESPA pumping are approximately 93% of steady-state after 30 years and 98% of steady-state after 50 years:

It follows that the steady-state curtailment runs that IDWR has used for eighteen years, since the Director issued his first SWC curtailment order in 2005, represent reasonable estimates of the last increment of depletions to the near Blackfoot to Minidoka reach being caused by wells that are junior to the simulated curtailment date. These impacts reflect the aggregated impacts of all current and prior pumping by the junior wells. In my opinion, steady-state modeling is the technically correct way to determine the curtailment date for the SWC Methodology.

In Colorado, it was recognized early on that it was impractical to conjunctively administer wells and surface water rights in the same manner as administration between surface water rights because of the delayed impacts on surface streams from curtailing groundwater pumping. Use of transient modeling effectively attempts to administer groundwater rights as if they were surface water rights, which is ill advised because of the delayed response of streamflows to groundwater curtailment. A more elegant and efficient solution is to require junior groundwater users to offset impacts to senior surface water rights caused by current and prior pumping. In that way, the seniors are protected



from injury and the junior groundwater users can continue to pump. This was the practice in Idaho until the imposition of the Fifth Methodology Order and has been the practice in Colorado for over 50 years.

In Colorado, junior groundwater users are required to have a judicially or administratively approved plan in place that is capable of replacing the injurious impacts on surface users in time, place, and amount in order for the juniors to pump any groundwater. Otherwise, the junior groundwater user is permanently curtailed unless or until they can obtain approval of a replacement plan.

In sum, the process of determining curtailment dates based on steady-state runs should *continue* to be applied in the Upper Snake River Basin because it will properly assign the obligation for mitigating any computed shortages to the SWC members to the junior groundwater users whose current and prior pumping is the cause of the shortage.

Further, in my opinion, implementation of transient groundwater modeling in the Fifth Methodology Order will cause injury to certain groundwater users by requiring them to mitigate for impacts to senior surface water rights that they did not cause.

Consider the present situation with a predicted shortage to the TFCC of 75,200 AF in 2023. It is the last 75,200 AF of depletions to the near Blackfoot to Minidoka reach that created the current shortage. Based on the following graph presented by Jennifer Sukow during the November 28, 2022, TWG meeting, curtailment of pumping from wells junior to sometime in the mid-1980s would produce 75,200 AF/y of water at steady state to the near Blackfoot to Minidoka reach.

In other words, the last 75,200 AF of depletions to this reach that created the shortage to the TFCC was caused by wells junior to the mid-1980s.

Under the prior appropriation doctrine, the wells senior to the mid-1980s are entitled to the conditions that existed at the time of their appropriation. Among those conditions would be that the last 75,200 AF of depletion to the near Blackfoot to Minidoka reach caused by more junior wells would not have occurred and would not have created the shortage to TFCC that exists in 2023. Curtailing or requiring mitigation from groundwater rights in 2023 with priority dates senior to the mid-1980s would injure those groundwater rights because pumping under these more senior groundwater rights did not create the shortage to the TFCC this year. The obligation to mitigate the 75,200 AF of shortage to the TFCC in 2023 should be shouldered by wells junior to the mid-1980s. These are the wells whose current and prior pumping created the shortage in 2023.

7.0 SUMMARY OF OPINIONS

Based on my review and analysis of the materials disclosed by IDWR, my involvement in SWC Delivery Call matters since 2005, and my 37 years of experience in conjunctive administration of groundwater and surface water rights, the following is summary of my professional opinions on the Fifth Methodology Order and the April As-Applied Order.

1. IDWR made substantive changes to the SWC Methodology in the Fifth Methodology Order including a change in the BLY used to forecast SWC member demands at the beginning of the year, changes in the monthly project efficiencies used to compute demands mid-season, and changes in how the priority date for curtailment of junior groundwater users is determined.
2. It has been over 15 years since the last comprehensive review of the SWC Methodology. During that time, there have been numerous changed conditions that dictate that all elements of the SWC Methodology be reassessed to determine if they remain appropriate for determining shortages to the SWC members caused by junior groundwater pumping and whether the proposed changes to the SWC Methodology are reasonable and appropriate.
3. The proposed change in the BLY from 06/08/12 to 2018 that increased the combined BLY demand by approximately 142,000 AF was arbitrary and unreasonable given that the 06/08/12 BLY is only 40 AF (0.001%) less than the 2000 – 2021 average diversions. Further, if the diversions from 2022 are considered in computing the average annual diversions, then the 06/08/12 diversions would still be above average and would still qualify as a BLY.
4. The combined diversions of the SWC members have increased by an average of 148,826 AF since 2005 while average project efficiencies of most SWC members have declined. IDWR has not analyzed the reasonableness of these changes in light of the substantive increases these changes will cause to the computed shortages of the SWC members.
5. Continued sprinkler conversions and advancements in irrigation technology and management suggest that project efficiencies should have increased over the last 15 years rather than decreased.
6. Lower project efficiencies for certain of the SWC members in some or all months will cause unreasonable increases in computed diversion demands and water shortages, especially for TFCC.

7. Unreasonably low efficiencies during the shoulder months of April, May, September, and October will cause unreasonable monthly water demands, especially in months when the CWN is greater than average.
8. Industry standard procedures should be employed to assess the reasonableness of the monthly project efficiencies of the SWC members, including the reductions in project efficiencies that have occurred over the last 15 years. IDWR employed such procedures in evaluating whether Unit B was short of water in assessing the A&B delivery call in 2008.
9. Scatter plots of monthly diversions vs CWN during the last 15 years show that CWN is often a poor predictor of the diversion demands of the SWC members. This indicates that the SWC Methodology should be examined and revised to improve how the diversion demands of the SWC members are determined.
10. Project efficiencies are unexpectedly well-correlated to CWN for many SWC members in some months and for NSCC and TFCC in most months. This is a symptom of more water being diverted than is needed to meet crop water demand.
11. Use of CWN and average monthly project efficiencies will overstate SWC diversion demands in months with above average CWN.
12. The SWC Methodology would be improved by changing the way that monthly project efficiencies are determined for computing RISD. Regression equations based on CWN should be used for months with a moderate to strong correlation (R-squared > 0.5) with a floor no lower than the average monthly efficiency during the past 15 years. In months without a good correlation to CWN (R-squared < 0.5), project efficiencies should be set at the 75th percentile of efficiencies during the past 15 years. The monthly efficiency values for September should be used for October.
13. The irrigated area determined from shapefiles submitted by several of the SWC members exceeds the irrigated area determined by IDWR from analysis of aerial imagery and remote sensing in recent years. It is unreasonable and unlawful for non-irrigated acreages to be included in computing the CWN of the SWC members.
14. The discrepancy between claimed and actual irrigated area is especially egregious for TFCC which claims an irrigated area that is 15,276 acres greater than the irrigated area determined by IDWR in 2021. Based on an average annual ET rate of 2.2 AF/ac and an average project efficiency of 35%, the acreage discrepancy for TFCC would amount to approximately 96,000 AF, which is greater than the forecast shortage for TFCC in 2023 of 75,200 AF in the 2023 April As-Applied Order.

15. The SWC Methodology has long specified that supplemental groundwater pumping be considered in determining whether shortages to the SWC members exist. However, IDWR has done nothing over the past fifteen years to quantify or estimate the supplemental pumping of the SWC members. This is despite the availability of groundwater right mapping and groundwater pumping records that could be analyzed to reasonably determine the supplemental pumping of the SWC members.

16. The change in use of the ESPAM to determine the priority date of curtailment based on transient groundwater modeling is unreasonable because it will result in groundwater users having to mitigate or be curtailed for shortages to the SWC members that they did not cause. This is counter to the prior appropriation system and will cause injury to groundwater users.

17. Steady-state groundwater modeling is more appropriate for use in determining the priority date of curtailment for purposes of the SWC Methodology because virtually all of the ESPA pumping has been occurring since at least the early 1990s when the moratorium against new wells was instituted, and by 2023, the effects of ESPA pumping on Snake River flows have reached near-steady state.

18. Use of transient groundwater modeling to determine the priority date of curtailment improperly attempts to conjunctively administer groundwater rights under surface water right administration procedures. Conjunctive administration through curtailment is extremely inefficient and counter to mechanisms developed in Colorado and other western states in which conjunctive administration is enacted through replacement of depletions rather than through curtailment.

8.0 INFORMATION RELIED ON

The following information was relied upon in preparing this expert report.

Anders, Matthew. 2023. Deposition of Matthew Anders, P.G. on May 12, 2023. In the Matter of the Request of Administration in Water District 120 and the Request for Delivery of Water to Senior Surface Water Rights by A&B Irrigation District, American Falls Reservoir District #2, Burley Irrigation District, Milner Irrigation District, Minidoka Irrigation District, North Side Canal Company, and Twin Falls Canal Company ["SWC"]. Summary of Recommended Technical Revisions to the 4th Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover for the Surface Water Coalition. By: Kara Ferguson, Staff Hydrologist & Matt Anders, Hydrology Section Supervisor. December 23, 2022.

IDWR. 2023a. 37.03.11 – Rule for Conjunctive Manage of Surface and Ground Water Resources. IDAPA 37 – Department of Water Resources. Water Compliance Bureau. Available from: https://adminrules.idaho.gov/rules/current/37/. Last Accessed: May 22, 2023.

IDWR. 2023b. Fifth Amended Final Order Regarding Methodology Order for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover. In the Matter of the Request of Administration in Water District 120 and the Request for Delivery of Water to Senior Surface Water Rights by the SWC. April 21, 2023.

IDWR. 2023c. Final Order Regarding Aril 2023 Forecast Supply (Methodology Steps 1-3). In the Matter of the Request of Administration in Water District 120 and the Request for Delivery of Water to Senior Surface Water Rights by the SWC. April 21, 2023.

Sullivan, 2007a. Spronk Water Engineers, Inc. Updated Expert Report Dated September 26, 2007 (revised December 2007). Prepared for the City of Pocatello. In the Matter of the Request of Administration in Water District 120 and the Request for Delivery of Water to Senior Surface Water Rights by the SWC, and all references listed therein.

Sullivan, 2007b. Direct testimony of Gregory K, Sullivan, P.E. September 26, 2007 (Revised December 2007). Submitted on behalf of the City of Pocatello. In the Matter of Distribution of Water to Various Water Rights Held by or for the Benefit of the SWC.

Sullivan, 2007c. Spronk Water Engineers, Inc. Expert Rebuttal Report. November 7, 2007 (Revised December 2007). Prepared for the City of Pocatello. In the Matter of the Request of Administration in Water District 120 and the Request for Delivery of Water to Senior Surface Water Rights by the SWC, and all references listed therein.

Sullivan, 2008a. Spronk Water Engineers, Inc. Expert Report Dated July 16, 2008 Prepared for the City of Pocatello. In the Matter of the Petition for Delivery Call of A&B Irrigation District for Delivery of Ground Water and for the Creation of a Ground Water Management Area, and all references listed therein.

Sullivan, 2008b. Spronk Water Engineers, Inc. Expert Rebuttal Report Dated August 27, 2008 Prepared for the City of Pocatello. In the Matter of the Petition for Delivery Call of A&B Irrigation District for Delivery of Ground Water and for the Creation of a Ground Water Management Area, and all references listed therein.

Sullivan, 2008c. Spronk Water Engineers, Inc. Expert Sur-Rebuttal Report Dated September 16, 2008 Prepared for the City of Pocatello. In the Matter of the Petition for Delivery Call of A&B Irrigation District for Delivery of Ground Water and for the Creation of a Ground Water Management Area, and all references listed therein.

Sullivan, 2015. Email to IDWR. Pocatello Comments on Draft Staff Memo. March 10, 2015.

Sullivan and Netter, 2023. Spronk Water Engineers, Inc. Comments on behalf of the Coalition of Cities and the City of Pocatello on the Idaho Department of Resources Summary of Recommended Technical Revisions to the 4th Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover for the Surface Water Coalition, by Kara Ferguson and Matt Anders on December 23, 2022.

Sullivan, 2023a. Declaration of Gregory K, Sullivan, P.E. May 7, 2023. In the Matter of Distribution of Water to Various Water Rights Held by or for the SWC.

Sullivan, 2023b. Declaration of Gregory K, Sullivan, P.E. May 7, 2023. In Regard to Irrigated Acres in the SWC Methodology Order. In the Matter of Distribution of Water to Various Water Rights Held by or for the Benefit of the SWC.

Notes:

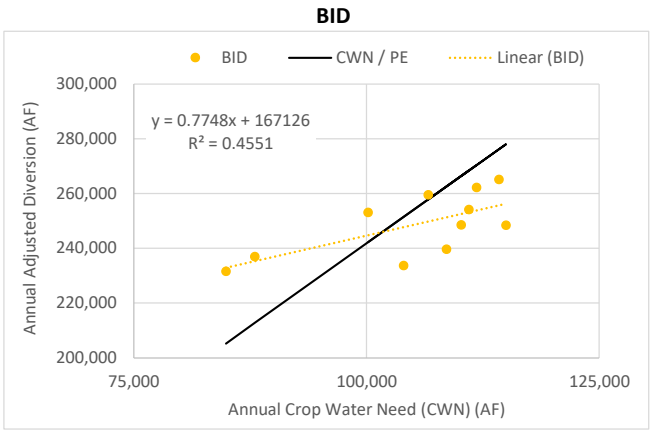
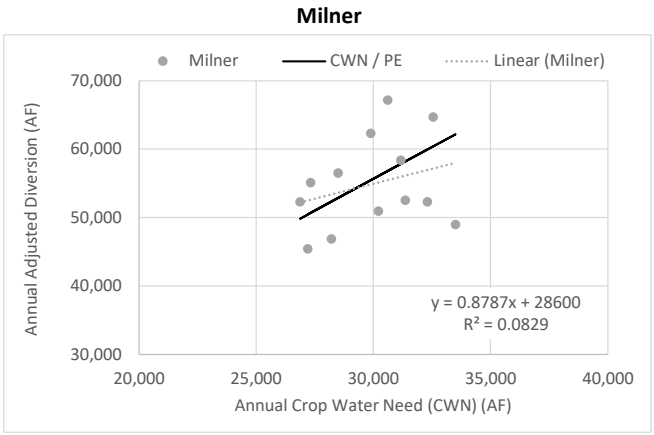
(1) From September 26, 2007 Sullivan Expert Report, SWC Delivery Call.
Based on reported conveyance efficiency x achievable on farm efficiencies.



(2) From September 26, 2007 Sullivan Expert Report, SWC Delivery Call.
Based on analysis of SWC operations for 1990 - 2006.



(3) From April 21, 2023 Fifth Methodology Order at 14.
Based on average of monthly efficiencies during 2007 - 2021.

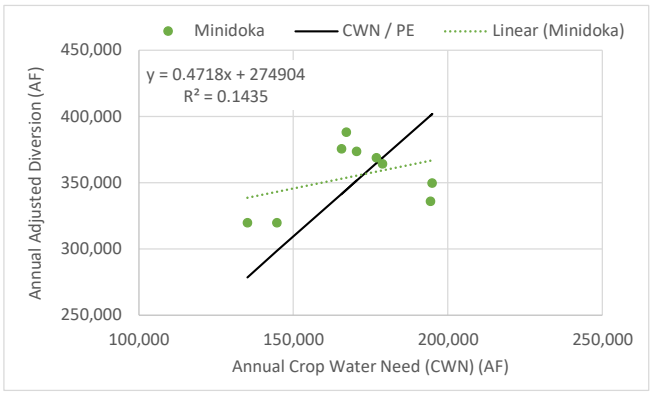


Figure 3-4
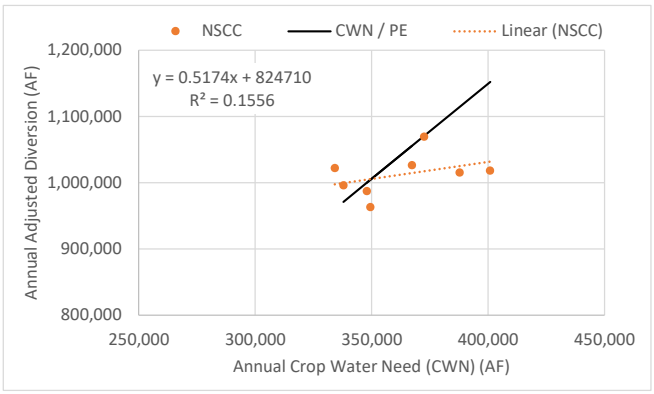
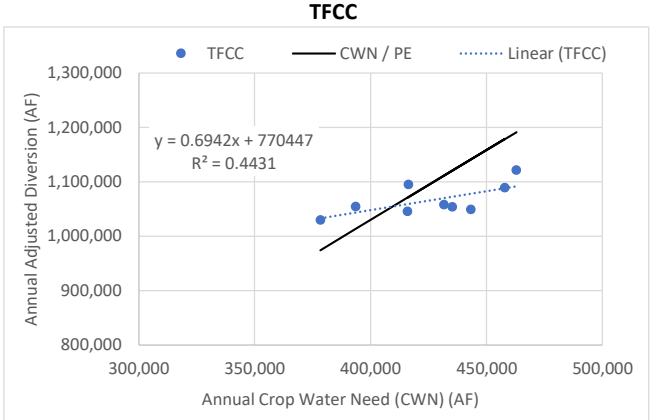
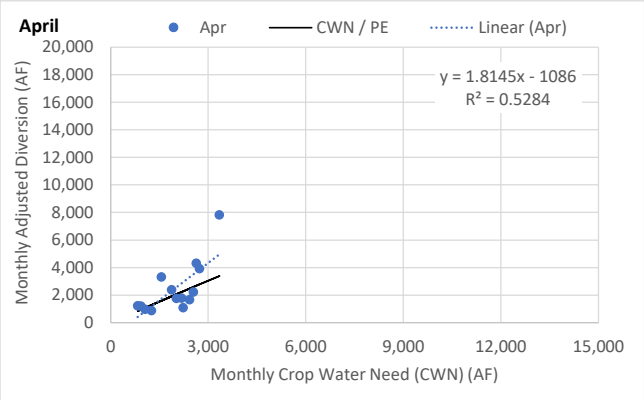
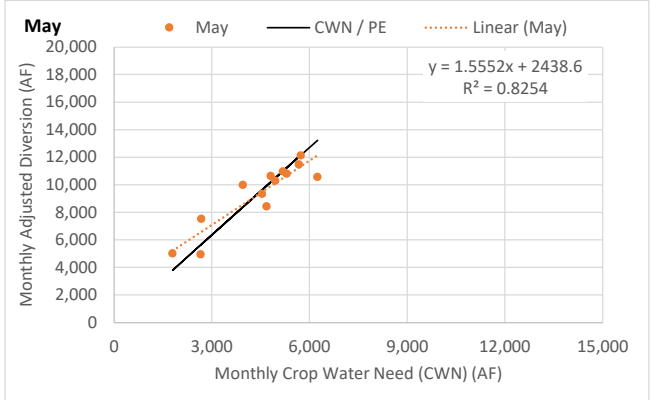
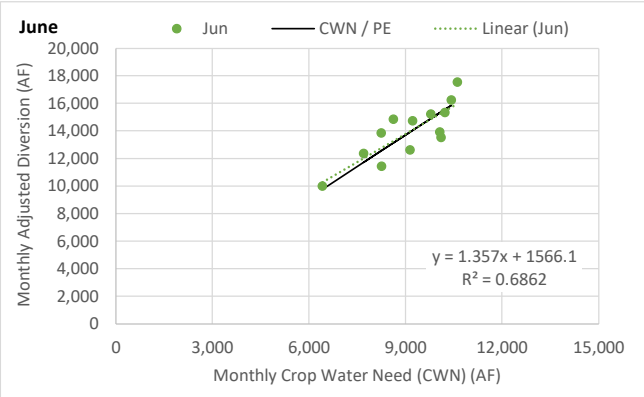
Annual Adjusted Diversion v. Annual Crop Water Needs (CWN)
Surface Water Coalition Members
2007 - 2021
Exclude PE Outlier Months (> +/- 2 Std Dev)



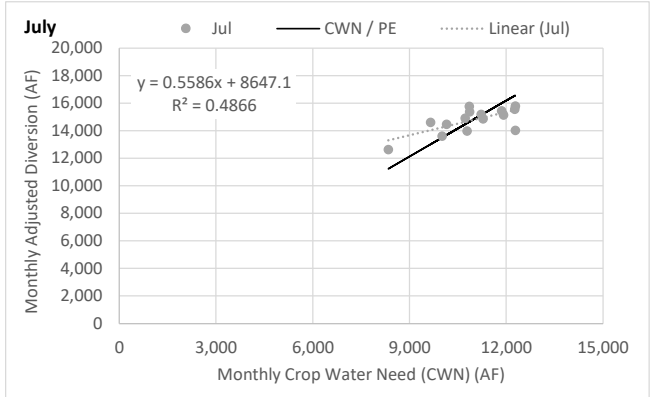








Notes:
Note different scales.



(1) Annual Crop Water Need (CWN) is the crop weighted average irrigation water requirement multiplied by the District reported irrigated area (IDWR spreadsheet: "DS RISD Calculator_2022_06-08-12_update to 15 yr avg_used for order.xlsx"
(2) Annual Adjusted Diversion are historical reported diversions adjusted for wheeled water and recharge (see IDWR spreadsheet: "DS RISD Calculator_2022_06-08-12_update to 15 yr avg_used for order.xlsx"
(3) Annual PE (colored dots) computed as the annual CWN (1) divided by the ann Adjusted Diversion (2).
(4) CWN/PE (black line) is the annual CWN (1) divided by the annual average Project Efficiency (PE).

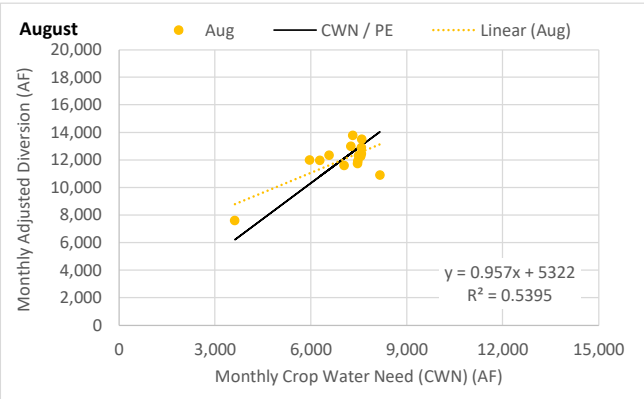


Figure 3-5

BEFORE THE DEPARTMENT OF WATER RESOURCES

OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **HEARING SUBPOENA: JENNIFER SUKOW**

To: **Jennifer Sukow**

Pursuant to IDAPA 37.01.01.523, you are commanded to appear before Gary Spackman, Director of the Idaho Department of Water Resources, at the Department of Idaho Water Resources' State Office, located at 322 E. Front Street, 6th Floor, Conference Rooms 602A–D, Boise, Idaho, at 9:00 A.M. on June 6, 7, 8, and 9, 2023, to serve as a witness in an administrative hearing in the above-entitled action.

SO ORDERED THIS 5th day of June 2023.

Gary Spackman
Director

CERTIFICATE OF SERVICE

I HEREBY CERTIFY that on this 5th day of June 2023, the above and foregoing, was served by the method indicated below, and addressed to the following:

Jennifer Sukow jennifer.sukow@idwr.idaho.gov	☒ Email

Sarah Tschohl
Paralegal

From: Baxter, Garrick
Sent: Tuesday, June 6, 2023 8:56 AM
To: Tschohl, Sarah; John K. Simpson; Travis L. Thompson; Jess Nielsen; wkf@pmt.org; tj@racineolson.com; Elisheva Patterson; 'David W. Gehlert (david.gehlert@usdoj.gov)'; Matt J Howard; Sarah A Klahn; Max C. Bricker; Diane Thompson; Diehl, Rich; Candice McHugh; Chris Bromley; Rob Williams (rewilliams@wmlattys.com); Robert L Harris; rfife@idahofallsidaho.gov; sjohns@olsentaggart.com; nolsen@olsentaggart.com; staggart@olsentaggart.com; Dylan Anderson; Olenichak, Tony; Skinner, Corey; 'William Parsons'
Cc: Spackman, Gary; Weaver, Mathew; Wood, Pete; Jenkins, Megan
Subject: Milner and Minidoka shapefiles
Attachments: swc_shapefiles_2023.zip

Dear Parties,
Paragraph 22 of the Fifth Methodology lists the number of irrigated acres in the shapefile for Milner as 13,264 acres, and the number of irrigated acres for Minidoka as 77,176 acres. These numbers are correct. On May 5, 2023, the Department provided the parties, and posted to our publicly available website, a variety information that Jennifer Sukow and Matt Anders may rely on at the June 6-10 hearing. Included in that information were the Milner and Minidoka shape files. It has come to the Department's attention that the Department inadvertently provided Milner and Minidoka's 2022 shapefiles—not the 2023 shapefiles. The Department apologies for the oversight. Attached to this email are the 2023 shapefiles for Milner and Minidoka. The Director anticipates taking official notice of these files at the hearing.

Attorneys for Idaho Ground Water Appropriators, Inc. (IGWA)

STATE OF IDAHO

DEPARTMENT OF WATER RESOURCES

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **IGWA's Reply to SWC's Response to IGWA's Amended Notice of Mitigation**

Idaho Ground Water Appropriators, Inc. ("IGWA"), acting on behalf of North Snake Ground Water District, Carey Valley Ground Water District, Magic Valley Ground Water District, Aberdeen-American Falls Ground Water District, Jefferson-Clark Ground Water District, Madison Ground Water District, Henry's Fork Ground Water District, Bonneville-Jefferson Ground Water District, and Bingham Ground Water District, hereby replies to the *Surface Water Coalition's Response to IGWA's Amended Notice of Mitigation* ("*SWC Response*") filed June 5, 2023.

First, the SWC argues that the 2009 Storage Water Mitigation Plan requires IGWA to provide mitigation equal to the entire 75,200 acre-feet Demand Shortfall predicted by the *April 2023 As-Applied Order* as opposed to the 63,645 acre-feet attributable to groundwater diversions by IGWA's patrons. (*SWC Response*, p. 2.) In other words, the SWC contends that for IGWA's patrons to avoid curtailment they must mitigate not only for their own groundwater diversions but also for the groundwater diversions of A&B Irrigation District, Southwest Irrigation District, the Water Mitigation Coalition, the Coalition of Cities, Pocatello, Idaho Falls, and the approximately 900 water rights having no mitigation plan.

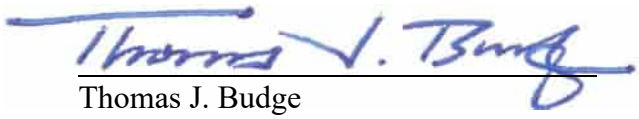
The SWC relies on a finding of fact in the *Order Determining Deficiency in IGWA's Notice of Secured Water* ("*Order*") which tells only half the story. Finding of Fact # 4 notes that when

IGWA filed its 2009 Storage Water Mitigation Plan, IGWA proposed to mitigate all material injury of senior users. At that time, IGWA did not have the modelling data needed to distinguish between reach gain impacts of groundwater use by IGWA's patrons versus reach gain impacts of groundwater use by other water users.

The Director's order approving the 2009 Storage Water Mitigation Plan states that "IGWA's obligation for mitigation shall be determined as set forth in the Methodology Order." (*Order Approving Mitigation Plan*, IDWR Docket No. CM-MP-2009-007, p. 10, Nov. 9, 2009.) This ruling is quoted in the *Order*, but ignored by the SWC. This ruling is significant because the Department now has the data needed to distinguish between reach gain impacts from groundwater use by IGWA's patrons versus other water users. Accordingly, the *April 2023 As-Applied Order* specifies IGWA's share of the total predicted Demand Shortfall as 63,645 acre-feet. This is the amount of mitigation for which IGWA is legally responsible, and this is the amount that IGWA will provide to the SWC.

Next, the SWC argues that IGWA has failed to comply with the Settlement Agreement dated September 7, 2022, between IGWA and the SWC. The SWC cites the term of that agreement that requires IGWA to "advise the Coalition of its ability to deliver 30,000 acre-feet of storage by April 1, 2023," and then asserts, disingenuously, that "IGWA has not done so." (*SWC Response*, p. 3.) The truth is, during the spring of 2023, counsel for IGWA spoke with counsel for the SWC on two different occasions about this term of the agreement, advising counsel for the SWC on both occasions that IGWA expects to be able to rent the full 30,000 acre-feet from other spaceholders, but that IGWA is prepared to rent storage from the SWC if needed. On both occasions, counsel for the SWC advised counsel for IGWA that the SWC would prefer that IGWA rent storage from other spaceholders. IGWA has proceeded accordingly.

Lastly, the SWC argues that IGWA has failed to comply with the September 7, 2022, Settlement Agreement by not submitting storage water contracts to the Director as proof of compliance. Yet, the terms of the agreement do not require IGWA to provide storage water contracts to the Director; it requires only that storage water be delivered to the SWC "within 10 days after the Date of Allocation." IGWA will abide by the terms of the agreement.



Dated this 6th day of June, 2023.

Attorneys for Idaho Ground Water Appropriators, Inc. (IGWA)

STATE OF IDAHO

DEPARTMENT OF WATER RESOURCES

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **IGWA's Petition for Reconsideration of Order Determining Deficiency in IGWA's Notice of Secured Water**

Idaho Ground Water Appropriators, Inc. ("IGWA"), acting on behalf of North Snake Ground Water District, Carey Valley Ground Water District, Magic Valley Ground Water District, Aberdeen-American Falls Ground Water District, Jefferson-Clark Ground Water District, Madison Ground Water District, Henry's Fork Ground Water District, Bonneville-Jefferson Ground Water District, and Bingham Ground Water District, through counsel, submit this petition for reconsideration of the *Order Determining Deficiency in IGWA's Notice of Secured Water* issued May 23, 2023 ("*Order*") in this matter.

First, IGWA respectfully requests that the Director withdraw the new requirement that Water District 1 fees be paid before the Director will accept signed storage water lease or option contracts as proof of IGWA's ability to provide storage water as mitigation. The order approving the 2009 Storage Water Mitigation Plan does not require payment of fees prior to the delivery of storage water to the SWC; it simply requires "proof of rental or an option to rent storage water," evidenced by "fully executed and irrevocable contracts with holders of Snake River storage." (*Order Approving Mitigation Plan*, IDWR Docket No. CM-MP-2009-007, June 3, 2010.) IGWA has traditionally waited until July or August to pay Water District 1 fees on storage water that is provided to the Surface Water Coalition (SWC) as mitigation, without issue. IGWA has never

failed to pay such fees. Moreover, fees cannot be paid on water secured by option contract until the option is exercised, which may not occur until after Steps 6 and 7 of the Methodology Order.

Second, the *Order* questions IGWA's compliance with the 2009 Storage Water Mitigation Plan on the basis that "it is unclear whether IGWA has the authority to submit the ground water districts contracts to the Director for consideration." *Order* at 5). This conjecture is without merit as the districts in question (Bingham Ground Water District and Bonneville-Jefferson Ground Water District) are members of IGWA, regardless of their decision to appear separately in select matters. *IGWA's Notice of Ground Water District Mitigation* states explicitly that it is submitted on behalf of all of IGWA's member ground water districts. If Bingham Ground Water District or Bonneville-Jefferson Ground Water District contested IGWA's authority to provide notice of mitigation on their behalf, they would have said so. They have not.

DATED June 6, 2023.

BEFORE THE DEPARTMENT OF WATER RESOURCES

OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **ORDER DENYING MOTION FOR DIRECTOR TO ISSUE SUBPOENAS**

BACKGROUND

On June 1, 2023, the Cities of Bliss, Burley, Carey, Declo, Dietrich, Gooding, Hazelton, Heyburn, Idaho Falls, Jerome, Paul, Pocatello, Richfield, Rupert, Shoshone, and Wendell (collectively the "Cities"), the Idaho Ground Water Appropriators, Inc. ("IGWA"), Bonneville-Jefferson Groundwater District ("BJGWD"), and Bingham Groundwater District ("BGWD") (collectively "Groundwater Users"), filed a *Motion for Director to Issue Subpoenas* ("Motion for Subpoenas").

The Groundwater Users' motion requests that the Director issue subpoenas for Mathew Weaver, Deputy Director of the Idaho Department of Water Resources, and Tony Olenichak, Water District 01 Watermaster. *Motion for Subpoenas* at 2. The Groundwater Users further request that the witnesses be put on notice that they may be called at any time between June 6–10. *Motion for Subpoenas* at 3.

ANALYSIS

Rule 523 of the Department's Rules of Procedure grants the presiding officer the discretion to issue subpoenas. IDAPA 37.01.01.523 ("The presiding officer may issue subpoenas upon a party's motion or upon its own initiative."). Idaho Rule of Civil Procedure ("I.R.C.P.") 45(d)(1) advises that the court may quash or modify a subpoena if among things the subpoena is "unreasonable, oppressive, fails to allow time for compliance, requires disclosure of privileged or other protected matter and no exception or waiver applies, or subjects a person to undue burden …."

It does not appear Idaho Appellate Courts have answered what constitutes an unreasonable time for compliance with a subpoena to attend a hearing as contemplated under I.R.C.P. 45(d)(1). "In cases where no Idaho case law is directly on point, federal case law interpreting a similar federal rule can be persuasive." *State v. Fox*, 170 Idaho 846, 859, 517 P.3d 107, 120 (2022) (quoting *State v. Loera*, 167 Idaho 533, 538, 473 P.3d 802, 807 (2020)). Federal Rule of Civil Procedure ("F.R.C.P.") 45(3)(A)(i) advises that the court must quash a subpoena that "fails to allow a reasonable time to comply[.]" F.R.C.P. 45(3)(A)(i) is substantially similar

to I.R.C.P. 45(d)(1). Federal Courts appear to conclude that 14 days is presumptively reasonable, but notice of a week or less has generally been considered unreasonable. *See Angelo, Gordon & Co., L.P. v. MTE Holdings, LLC*, No. 20 MISC. 23, 2020 WL 4700910, at *2 (S.D.N.Y. Aug. 13, 2020) (citations omitted); *see also Jordan v. Comcast Cable Commc'ns Mgmt., LLC*, No. 1:14-CV-3622-WSD, 2016 WL 5899314, at *1 (N.D. Ga. Oct. 11, 2016) ("The Court finds Plaintiff's Counsel's subpoena, served a week before the hearing and before a three-day holiday weekend, fails to allow a reasonable time to comply and would subject Defendants to undue burden[.]"); *Brown v. Hendler*, No. 09 CIV. 4486 RLE, 2011 WL 321139, at *2 (S.D.N.Y. Jan. 31, 2011) ("[T]he Court finds that nine days was not a reasonable time to comply with the subpoena.").

As it pertains to Mr. Olenichak, he is not a party to this action. He lives in Idaho Falls, approximately 280 miles from Boise where the hearing will be held. The Groundwater Users have requested he be available to testify from June 6–10. *Motion for Subpoenas* at 3. It is unreasonable and overly burdensome to request a subpoena requiring Mr. Olenichak to travel—and stay overnight for 5 days—on less than a week's notice. This is especially true given that the hearing was set on April 21, 2023, or approximately 6 weeks ago. The Groundwater Users may request that Mr. Olenichak appear to testify of his own accord, whether remotely or in-person. But the Director will not subpoena Mr. Olenichak under these circumstances.

As it pertains to Mr. Weaver, he is likewise not a party to this action. Moreover, as the Groundwater Users advise, he is currently on a family vacation out of the country and will remain out of the country throughout the duration of the hearing. The Groundwater Users suggest Mr. Weaver could appear remotely as other individuals intend to. This is true, but Mr. Weaver was provided no advanced notice to prepare prior to leaving the country.

The Director has already identified two Department staff to testify at the hearing, Matthew Anders and Jennifer Sukow. During the prehearing conference the Director advised the parties he was limiting staff witnesses to Matthew Anders and Jennifer Sukow, but advised that he would consider enlarging the list if the parties could identify issues "outside of those that Matt Anders or Jennifer Sukow could discuss …." Prehr'g 41:25–41:41. The Groundwater Users request a subpoena so they can question Mr. Weaver concerning "the Department's preparation and issuance of the Fifth Methodology Order and the As-Applied Order ...." *Motion for Subpoenas* at 2. The Ground Water Users have failed to identify issues outside of those that Matthew Anders and Jennifer Sukow could discuss and which are appropriate for Mr. Weaver to testify to. Mr. Weaver cannot speak to what information the Director considered, the *Fifth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* speaks for itself in that regard.

ORDER

Based on the forgoing discussion, IT IS HEREBY ORDERED that the Groundwater Users' *Motion for Director to Issue Subpoenas* is DENIED.

DATED this 7th day of June 2023.

Gary Spackman
Director

Attorneys for Idaho Ground Water Appropriators, Inc. (IGWA)

STATE OF IDAHO

DEPARTMENT OF WATER RESOURCES

IN THE MATTER OF THE DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY AND FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **IGWA's Motion to Take Official Notice of Joint Forecast**

Idaho Ground Water Appropriators, Inc. ("IGWA"), on behalf of its members North Snake Ground Water District, Magic Valley Ground Water District, Carey Valley Ground Water District, Aberdeen-American Falls Area Ground Water District, Jefferson-Clark Ground Water District, Madison Ground Water District, and Henry's Fork Ground Water District, hereby moves the Director of the Idaho Department of Water Resources pursuant to rule 602 of the rules of procedure of the Department (IDAPA 37.01.01.602) to take official notice of relevant portions of the April Water Supply Outlook Report issued by the United States Department of Agriculture for the 2023 water year issued April 7, 2023 ("April 2023 Joint Forecast").

Rule 602 states: "The presiding officer may take official notice of any facts that could be judicially noticed in the courts of Idaho, of generally recognized technical or scientific data or facts within the agency's specialized knowledge and records of the agency." A fact which could be judicially noticed in the courts of Idaho include "a fact that is not subject to reasonable dispute because it: (1) is generally known within the trial court's territorial jurisdiction; or (2) can be accurately and readily determined from sources whose accuracy cannot reasonably be questioned." Idaho Rule of Evidence 201.

The *Fifth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* ("*Fifth Methodology Order*") issued April 21, 2023, relies upon the annual April Joint Forecast to predict the water supply that will be available to the SWC. Accordingly, the *Final Order Regarding April 2023 Forecast Supply (Steps 1-3)* ("*April 2023 As-Applied Order*") issued April 21, 2023, utilizes the April 2023 Joint Forecast to calculate the Demand Shortfall to the SWC under steps 1-3 of the *Fifth Methodology Order*.

Since the April Joint Forecast is a component of the *Fifth Methodology Order* and is utilized in the *April 2023 As-Applied Order*, IGWA respectfully requests that the Director take official notice of the portion of the April 2023 Joint Forecast attached hereto as ***Appendix A*** which consists of the entire April 2023 Joint Forecast except for the regional forecasts for areas that do not contribute to the SWC water supply (Panhandle Basins, Clearwater River Basin, Salmon River Basin, West Central Basins, Bear River Basin).

Dated this 8th day of June, 2023.

Natural Resources Conservation Service

Idaho Water Supply Outlook Report
April 1, 2023

New record SWE set at the Pebble Creek SNOTEL & Snow Course for April 1 (photo by Cameron Williams, 3/28/2023).

Pebble Creek SNOTEL site was installed in 2021 to expand snow monitoring in the Willow-Blackfoot-Portneuf basin. SNOTEL sites are often installed near existing snow courses so that the new data can be used right away in snow runoff forecasting. Measurements have been made at this snow course for 78 years and a new record was set this month with 87" depth and 29.5" SWE. Although we are excited that drought-stricken areas are finally getting relief, these large amounts of snow could lead to flooding in places if melting occurs too quickly this spring.

Water Supply Outlook Report

How forecasts are made

Most of the annual streamflow in the western United States originates as snowfall that has accumulated in the mountains during the winter and early spring. As the snowpack accumulates, hydrologists estimate the runoff that will occur when the snow melts. Measurements of snow water equivalent at selected manual snow courses and automated SNOTEL sites, along with precipitation, antecedent streamflow, and indices of the El Niño / Southern Oscillation are used in computerized statistical and simulation models to produce runoff forecasts. Unless otherwise specified, all forecasts are for flows that would occur naturally without any upstream influences.

Forecasts of any kind are not perfect. Streamflow forecast uncertainty arises from three primary sources: (1) uncertain knowledge of future weather conditions, (2) uncertainty in the forecasting procedure, and (3) errors in the data. The forecast, therefore, must be interpreted not as a single value but rather as a range of values with specific probabilities of occurrence. The middle of the range is expressed by the 50% exceedance probability forecast, for which there is a 50% chance that the actual flow will be above, and a 50% chance that the actual flow will be below, this value. To describe the expected range around this 50% value, four other forecasts are provided, two smaller values (90% and 70% exceedance probability) and two larger values (30%, and 10% exceedance probability). For example, there is a 90% chance that the actual flow will be more than the 90% exceedance probability forecast. The others can be interpreted similarly.

The wider the spread among these values, the more uncertainty is in the forecast. As the season progresses, forecasts become more accurate, primarily because a greater portion of the future weather conditions become known; this is reflected by a narrowing of the range around the 50% exceedance probability forecast. Users should take this uncertainty into consideration when making operational decisions by selecting forecasts corresponding to the level of risk they are willing to assume about the amount of water to be expected. If users anticipate receiving a lesser supply of water, or if they wish to increase their chances of having an adequate supply of water for their operations, they may want to base their decisions on the 90% or 70% exceedance probability forecasts, or something in between. On the other hand, if users are concerned about receiving too much water (for example, threat of flooding), they may want to base their decisions on the 30% or 10% exceedance probability forecasts, or something in between. Regardless of the forecast value users choose for operations, they should be prepared to deal with either more or less water. (Users should remember that even if the 90% exceedance probability forecast is used, there is still a 10% chance of receiving less than this amount.) By using the exceedance probability information, users can easily determine the chances of receiving more or less water.

Starting in 2020, streamflow forecasts with poor prediction skill (jackknife $r^2 < 0.34$) will no longer be issued. This will primarily affect the January and June forecasts, with little change anticipated for the February, March, April, and May forecasts. For more information, please contact Danny Tappa (daniel.tappa@usda.gov)

April 2023: Idaho Water Supply Summary

Overview

Mother Nature did not get the memo that winter was supposed to come to an end. March was colder than normal across Idaho with well above normal precipitation south of the Clearwater Basin (Fig. 1). Precipitation amounts were so high last month that water supply conversations shifted from, "will we get out of drought?" to concerns about potential flooding. How quickly the snowpack melts this spring will determine the balance of having enough water or too much water. Cold temperatures across the state have delayed the runoff season; these delays are especially apparent in the Southern Snake basins, which typically begin their runoff season in mid-March. With April forecasted to be cool and wet, increases in streamflow may continue to be delayed.

Large gains in the snowpack during March turned the tables for water supply. Streamflow forecasts are well above normal in southern Idaho, and in the Boise, Wood, Lost, Willow-Blackfoot-Portneuf, and Bear River basins. Water supply looks more than adequate across the state given the robust snowpack. Due to low reservoir storage in the Upper Snake River system, water supply could still be limited for some water users despite the improvements in this month's streamflow forecasts.

Weather and drought outlooks

The first part of April is expected to be warmer and potentially drier than normal before returning to cool, wet conditions. In general, April is expected to be cooler and wetter than normal according to the one month outlook from NOAA's Climate Prediction Center (CPC). Looking farther ahead, cool temperatures are favored this spring south of the Clearwater Basin. Northern Idaho may experience drier than normal conditions this spring; future precipitation conditions remain unknown elsewhere in the state. The CPC stated that La Niña conditions ended in March, and predict El Nino-Southern Oscillation (ENSO) neutral conditions this spring and early summer.

Drought status improved across large swaths of Idaho. Drought category improvements occurred where this year's snowpack is well above normal and reflect that northern Idaho is drier than central and southern Idaho. Currently, 31% of Idaho lands are in moderate drought (D1) with a portion of Lemhi County remaining in severe drought (D2); the rest of the state is abnormally dry (DO). After multiple years of drought conditions, it will take time to fully recover. The seasonal drought outlook predicts drought will persist in the Panhandle but will improve across the rest of the state.

Snowpack

It was a very snowy March with records set at many SNOTEL stations and snow courses! The snowpack is near to well above normal across the entire state (Fig. 3). Basins south of the Clearwater have the highest snowpack (SWE) percentages compared to northern Idaho. Although March wasn't quite as wet in northern Idaho, all basins in that area finally reached normal snowpack conditions (94% to 101%). Snowpack ranges from 113% to 226% in the rest of the state as of April 1 (Fig. 3). Compared to median peak snowpack values in each basin, snowpack ranges from 84% to 168% (Fig. 4). Whatever metric you use, we can agree this has been a banner snow year for southern Idaho that will be talked about for years to come.

Cooler than normal temperatures across the state, especially south of the Snake River Plain, preserved the low and mid-elevation snowpack. Usually in March, the snowpack in the Southern Snake basins has begun melting but this year, it has just kept growing. With warmer temperatures on the horizon, we should begin to see some melting occur at lower elevations. One way to track when the snowpack is ready to melt is to watch snow density increase as temperatures warm. As snow density reaches ~45%, it's a good indication the snowmelt runoff season has begun. These 'Snow to Flow' graphs are helpful to see the past timing of snowmelt compared to that year's snowpack, the Northwest River Forecast Center (NWRFC) provide river and flood forecasts, and the USGS site shows real-time streamflow conditions.

Precipitation

In March, northern Idaho was much drier than the rest of the state. Monthly precipitation was 60 to 102% compared to the rest of the state, where precipitation was 134 to 203% of normal (Fig. 1). This pattern of drier conditions in northern Idaho has persisted from fall and through this winter. Total water year precipitation is 75 to 81% of normal in northern Idaho, near normal in the Salmon, West Central, and Upper Snake basins, and well above normal everywhere else (Fig. 2). The southeast portion of the state continued to be the wettest at ~142% of normal total water year precipitation.

Water supply and streamflow forecasts

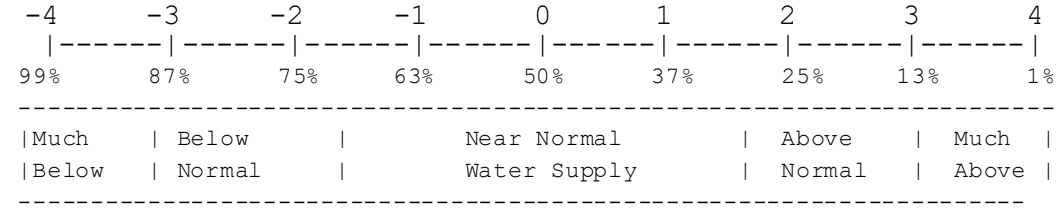
Water supply conditions have turned around since last month with the very wet, cold March. All basins, apart from Upper Snake River water users, can expect sufficient water supply this irrigation season. This holds true especially if we have normal to above normal spring precipitation. Due to low reservoir carryover, water supply may still be limited for some water users in the Upper Snake River. However, the water supply picture for this important region has vastly improved over this winter.

April 1 streamflow forecast volumes increased significantly from last month (Fig. 5), reflecting the well above normal March precipitation and massive gains in the snowpack. The unusually large amounts of snow still lingering at the low and mid-elevations strongly influenced the rise in snowmelt runoff forecasts. Although soil conditions remain dry and may reduce snowmelt volume, there's enough water headed our way that dry soils likely won't play as big of a role this year as the previous two. The impacts of having large amounts of snow at these lower elevations in late winter will be determined by how quickly warm spring temperatures arrive and whether the nights are also warm. We would like to see a gradual snowmelt progression to avoid flooding.

For the primary forecast period, well above normal streamflow volumes are predicted in the Southern Snake, Boise, Wood, Lost, Willow-Blackfoot-Portneuf, and Bear River basins. Near normal streamflow is forecasted for the Upper Snake, Henrys Fork-Teton, Payette, Weiser, and Salmon basins. Streamflow is forecasted to be below normal in the Clearwater and Panhandle basins. To look at the range of possible streamflow volume outcomes, consult these forecast graphics for your basin of interest. Streamflow, snowpack, and precipitation data for each basin can be accessed here or on the NRCS interactive map here.

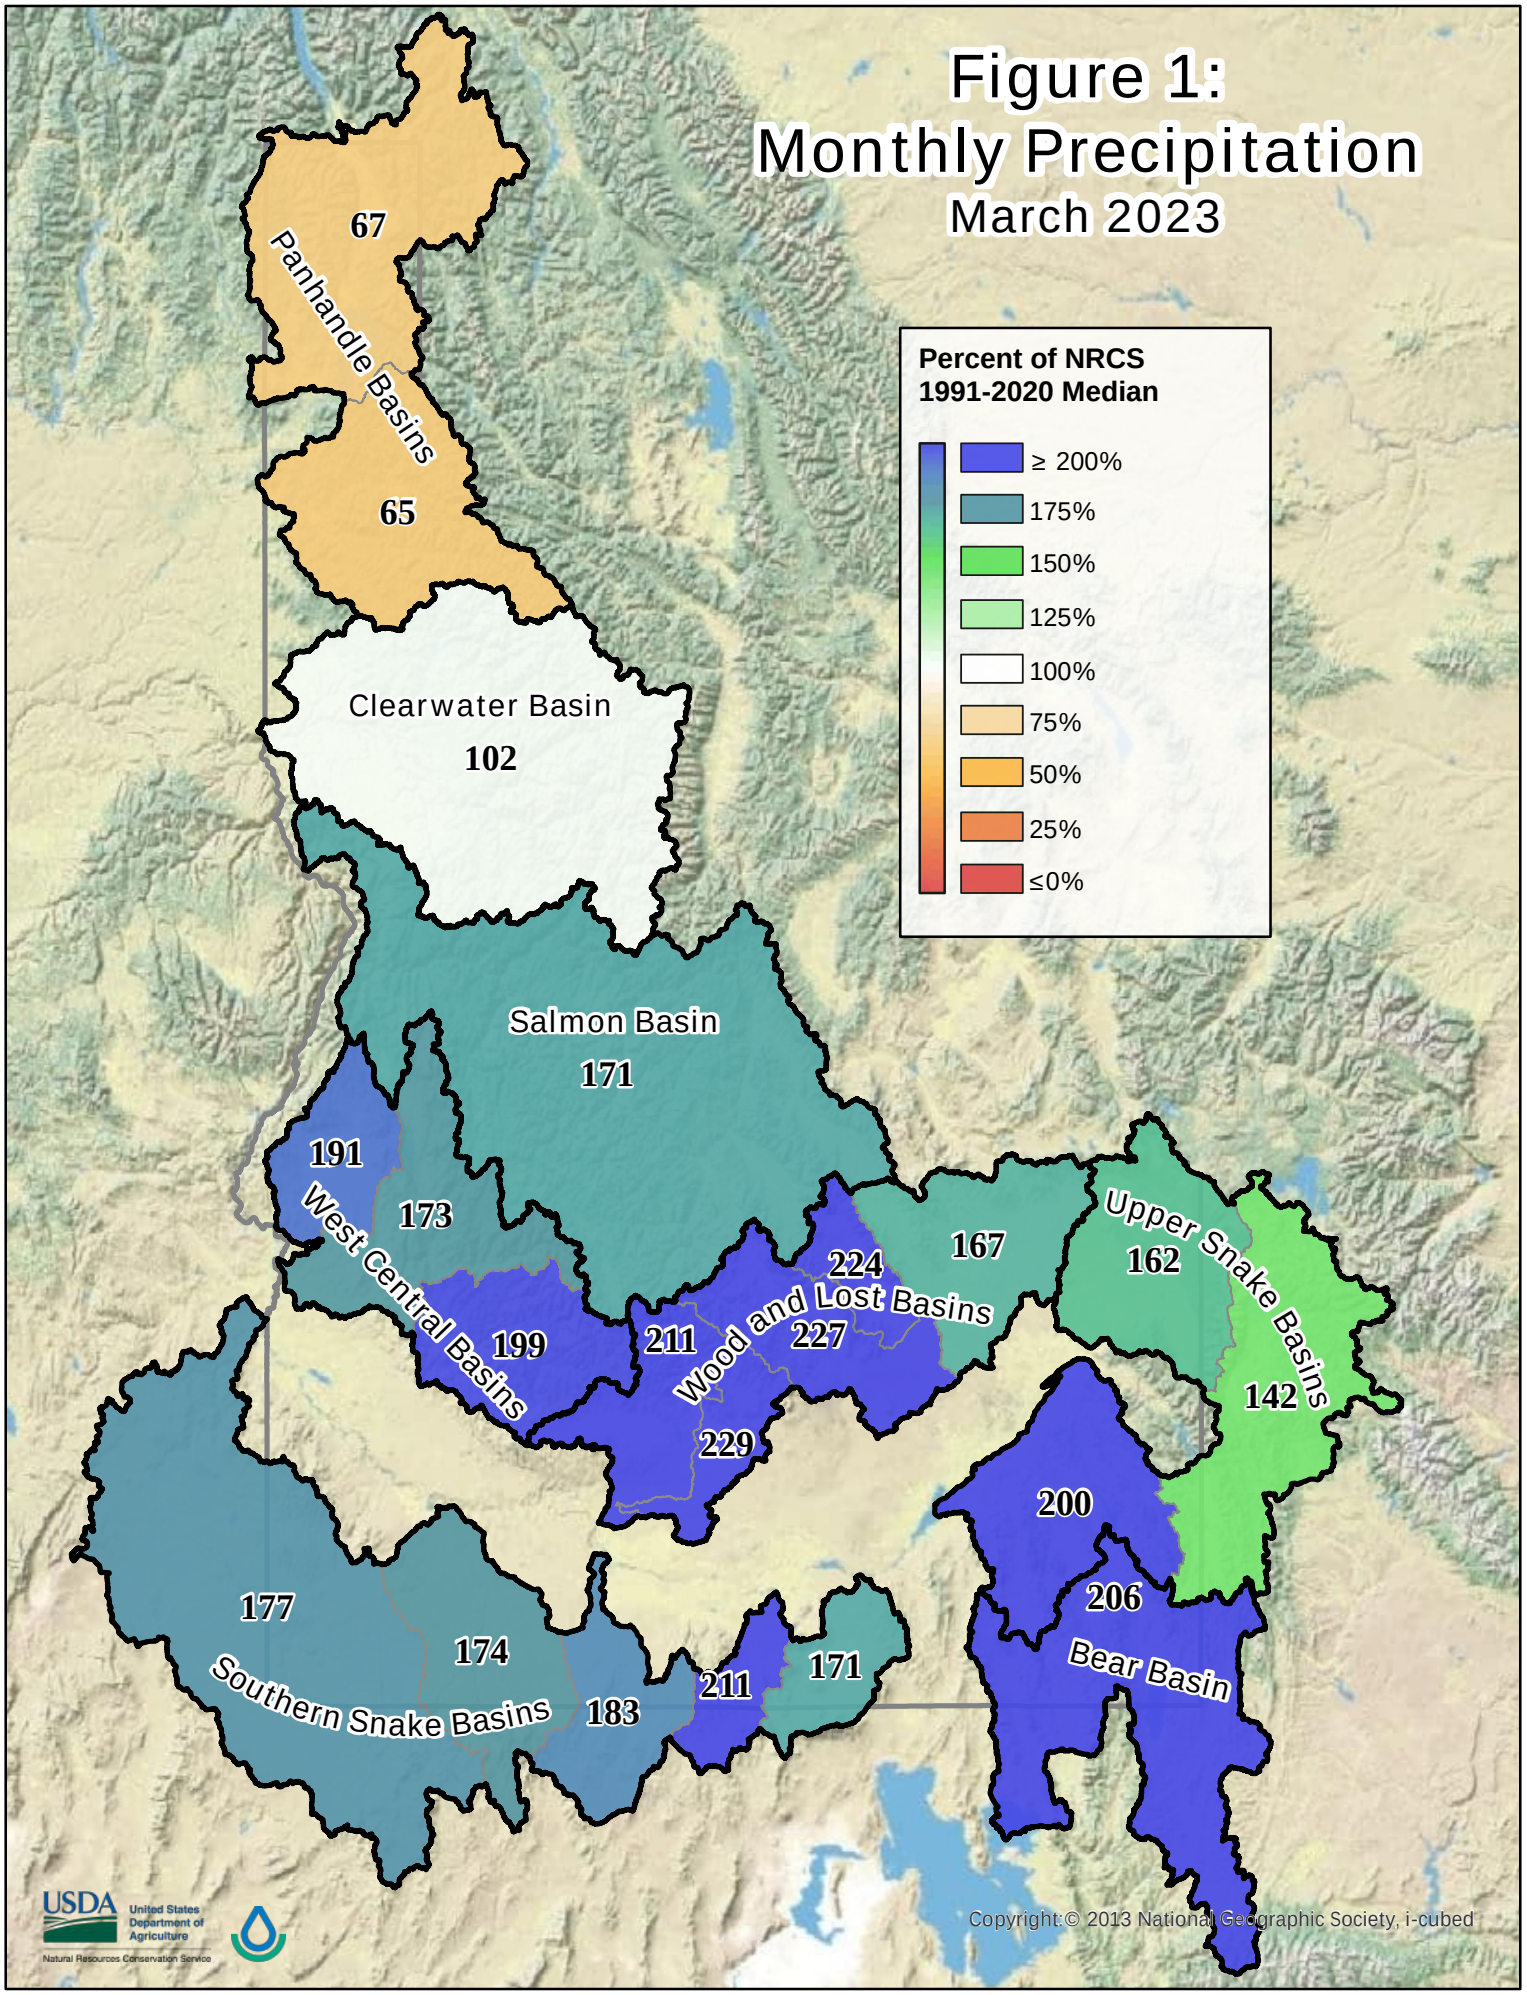
Reservoir storage is still below normal across many parts of the state. This makes sense because inflow into reservoirs has been very low this winter. Streamflow for the October 1 to April 1 time period is well below normal. This reflects the multi-year drought, reduced groundwater and dry soil conditions as well as the colder than normal temperatures throughout this winter. However, once the snowpack begins melting, we will quickly see reservoirs begin to fill. In anticipation of all the runoff, flood risk management operations began on the Boise River system on April 3. Reservoir storage in the Boise system is 64% of capacity and the Payette system is at 61% of capacity.

On April 6, reservoir storage in the Upper Snake River system (above Milner Dam) is ~2.22 million acre-feet and is 55% full. The system is unlikely to fill this year although a rainy spring in combination with the above normal snowpack would help bring reservoir levels closer to normal in the upper system (Jackon Lake and Palisades Reservoirs). The NRCS forecast for Snake River at Heise during the April through September period is 110% of normal (4,020 KAF). The forecast increased by 380,000 acre-feet from last month. Downstream, the NWRFC forecast for Snake River at Milner, is 103% of normal (6,371 KAF). Given current storage and streamflow forecasts, available water supply will likely be good but insufficient for all water users in this region. Continuation of wet conditions this spring would help alleviate water supply limitations for Upper Snake water users.

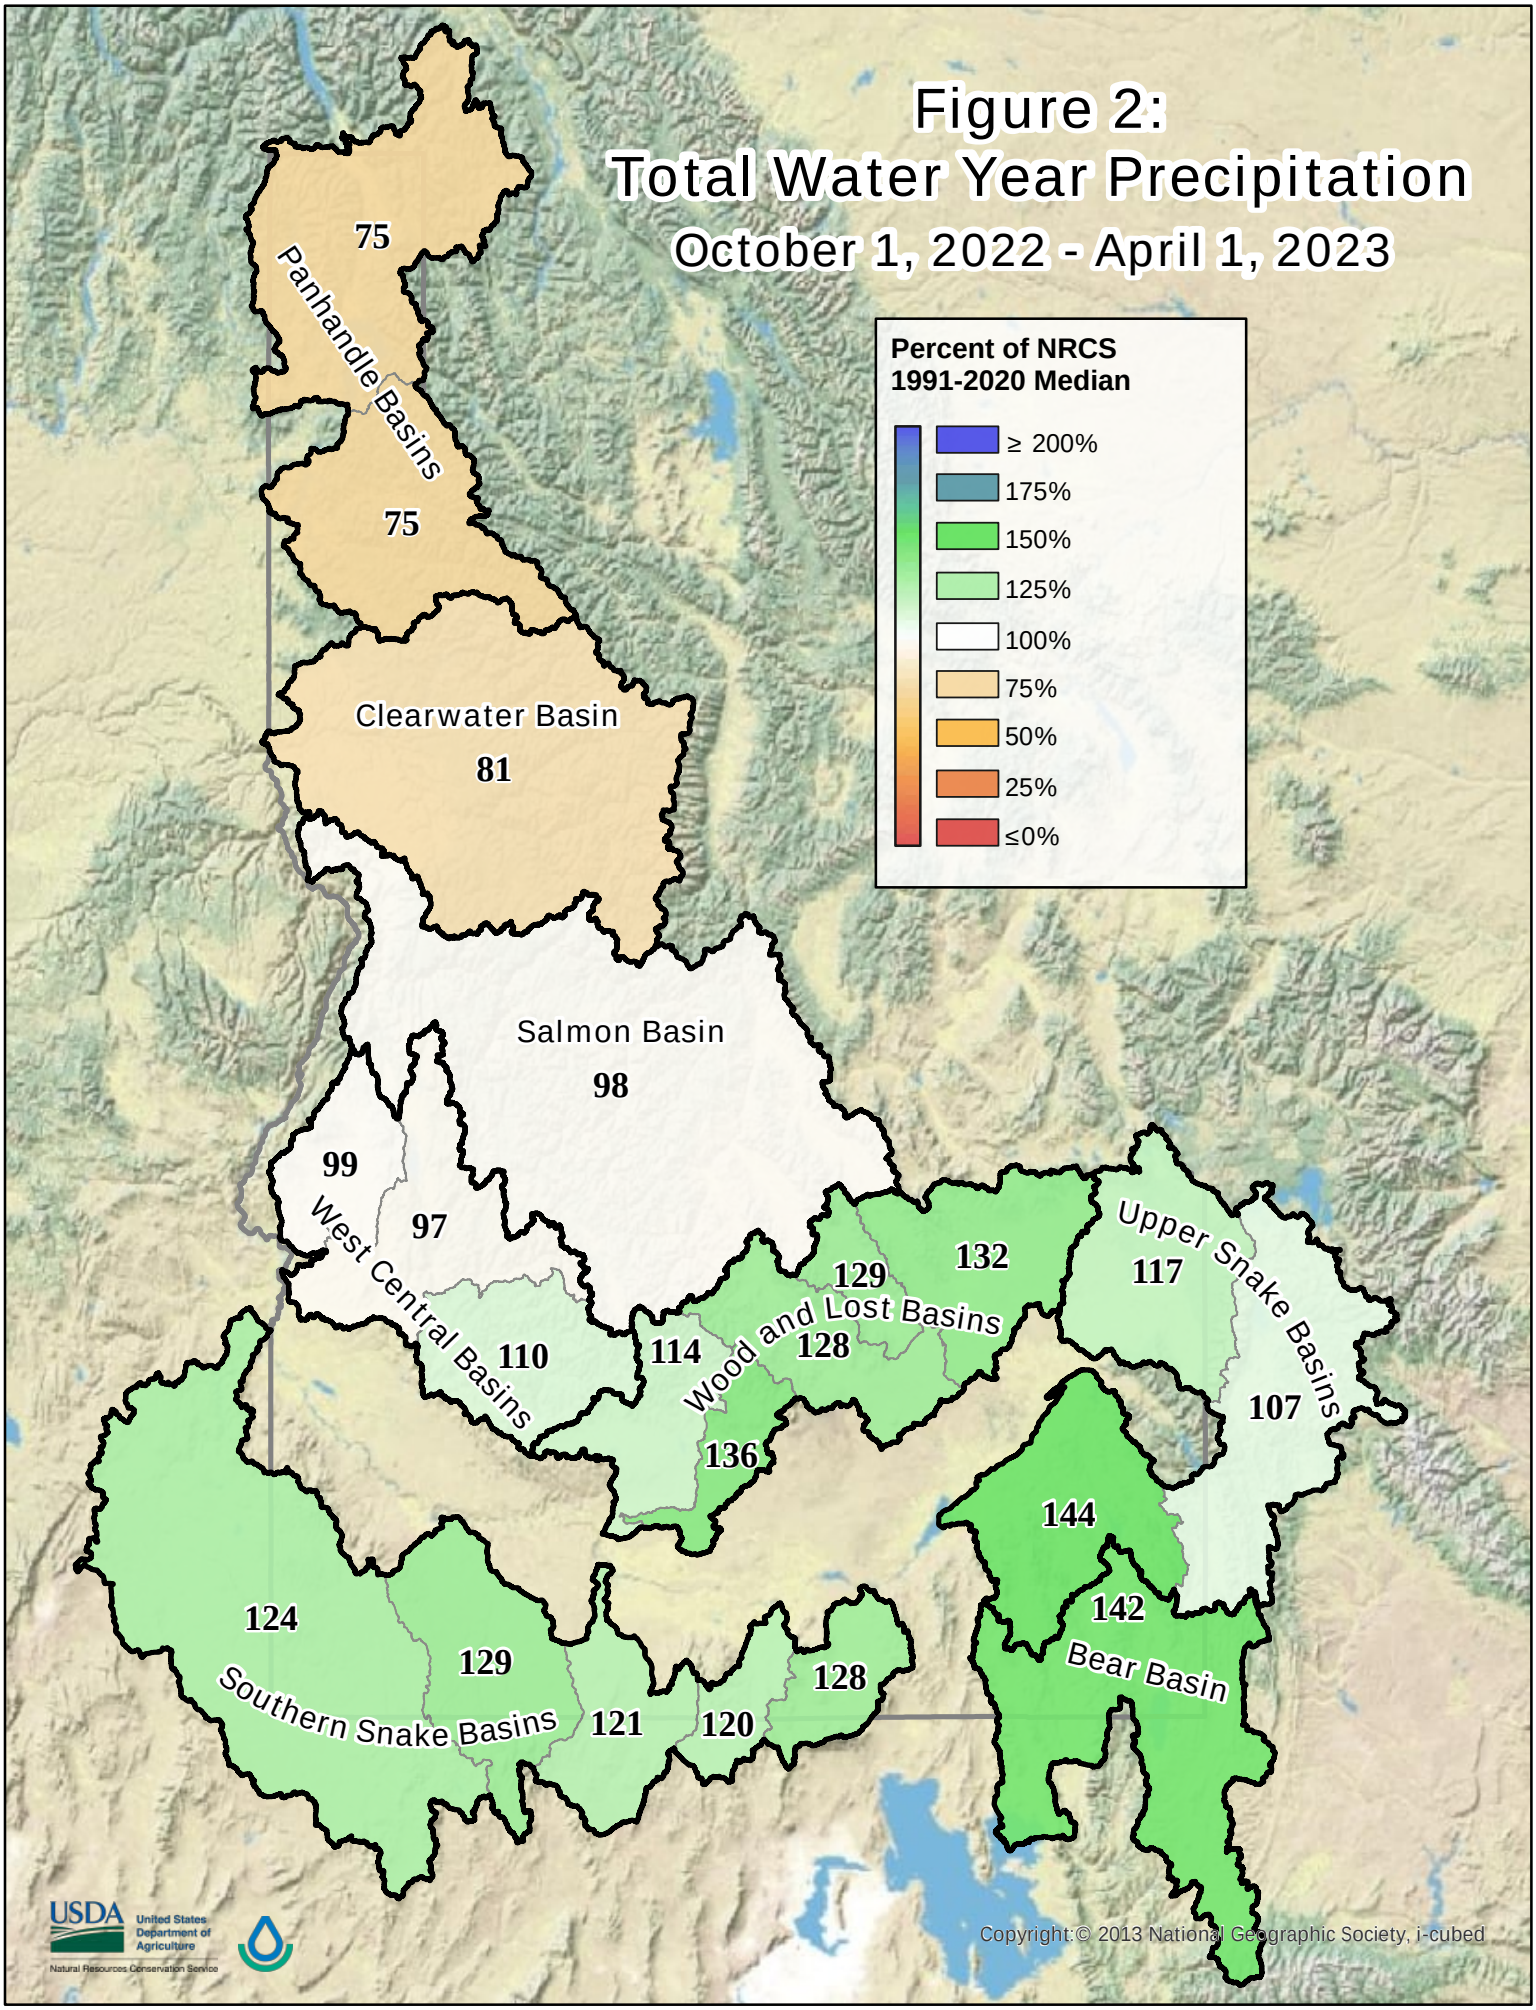


IDAHO SURFACE WATER SUPPLY INDEX (SWSI) April 1, 2023

The Surface Water Supply Index (SWSI) is a predictive indicator of surface water availability within a watershed for the spring and summer water use season. The index is calculated by combining pre-runoff reservoir storage (carryover) with forecasts of spring and summer streamflow. SWSI values are scaled from +4.0 (abundant supply) to -4.0 (extremely dry), with a value of zero indicating a median water supply as compared to historical occurrences. The SWSI analysis period is from 1991 to present.



SWSI values provide a more comprehensive outlook of water availability by combining streamflow forecasts and reservoir storage where appropriate. The SWSI index allows comparison of water availability between basins for drought or flood severity analysis. Threshold SWSI values have been determined for some basins to indicate the potential for agricultural irrigation water shortages.



BASIN or REGION	*SWSI Value*	*Most Recent Year With Similar SWSI Value*	*Agricultural Water Supply Shortage May Occur When SWSI is Less Than*
Spokane	**-0.8**	**2019**	**NA**

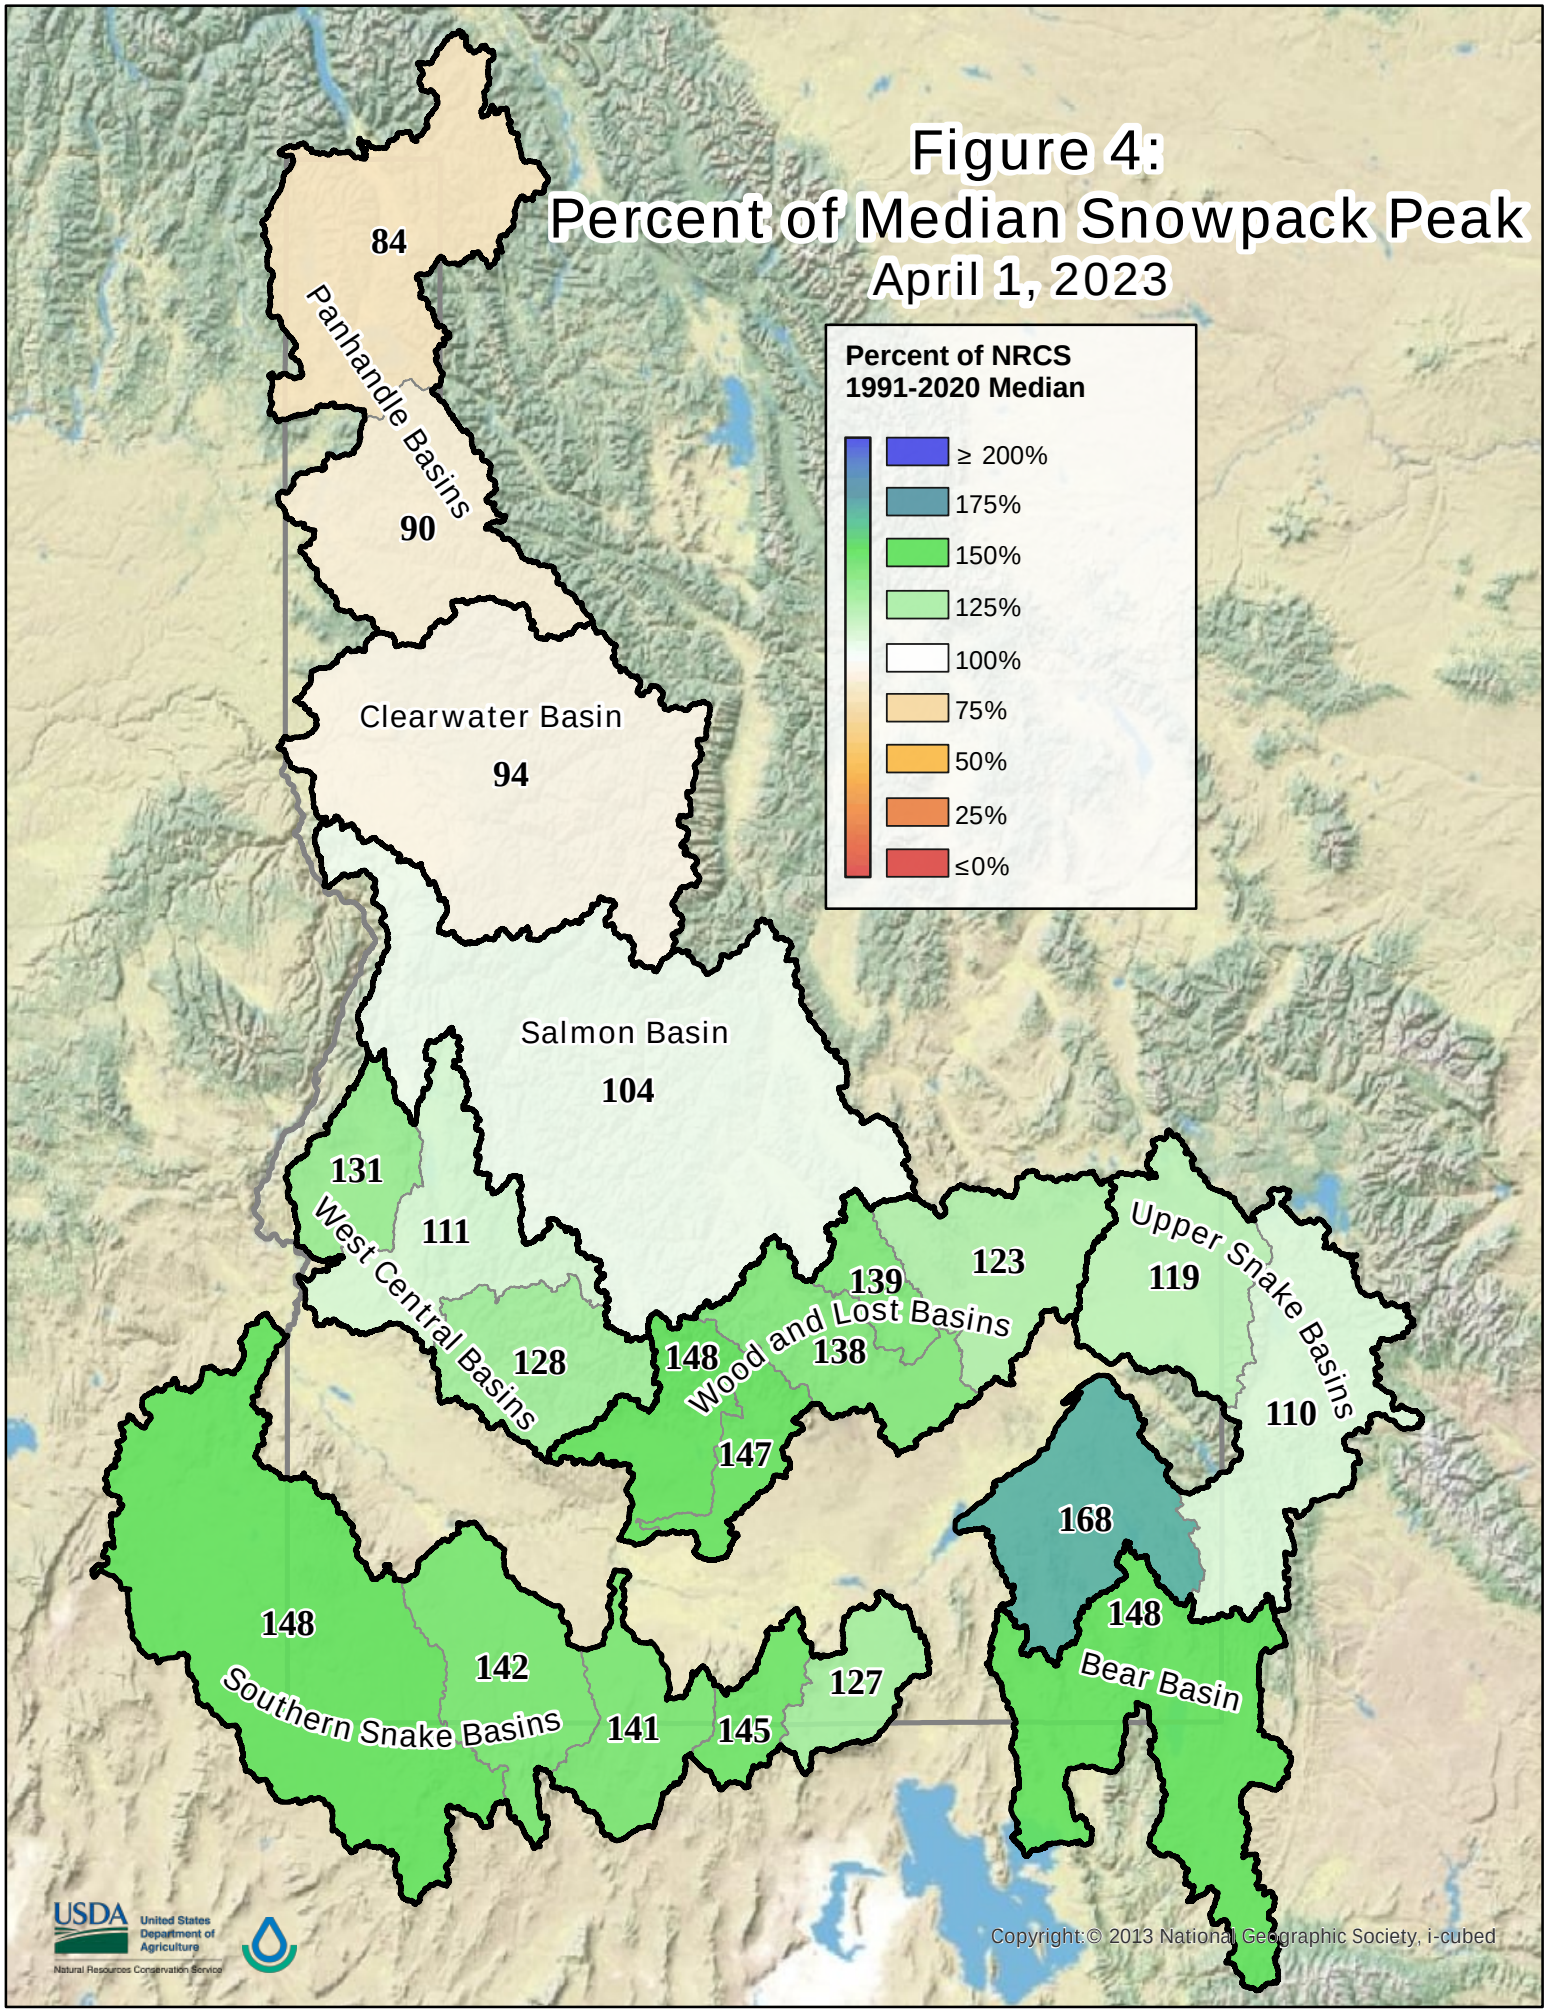
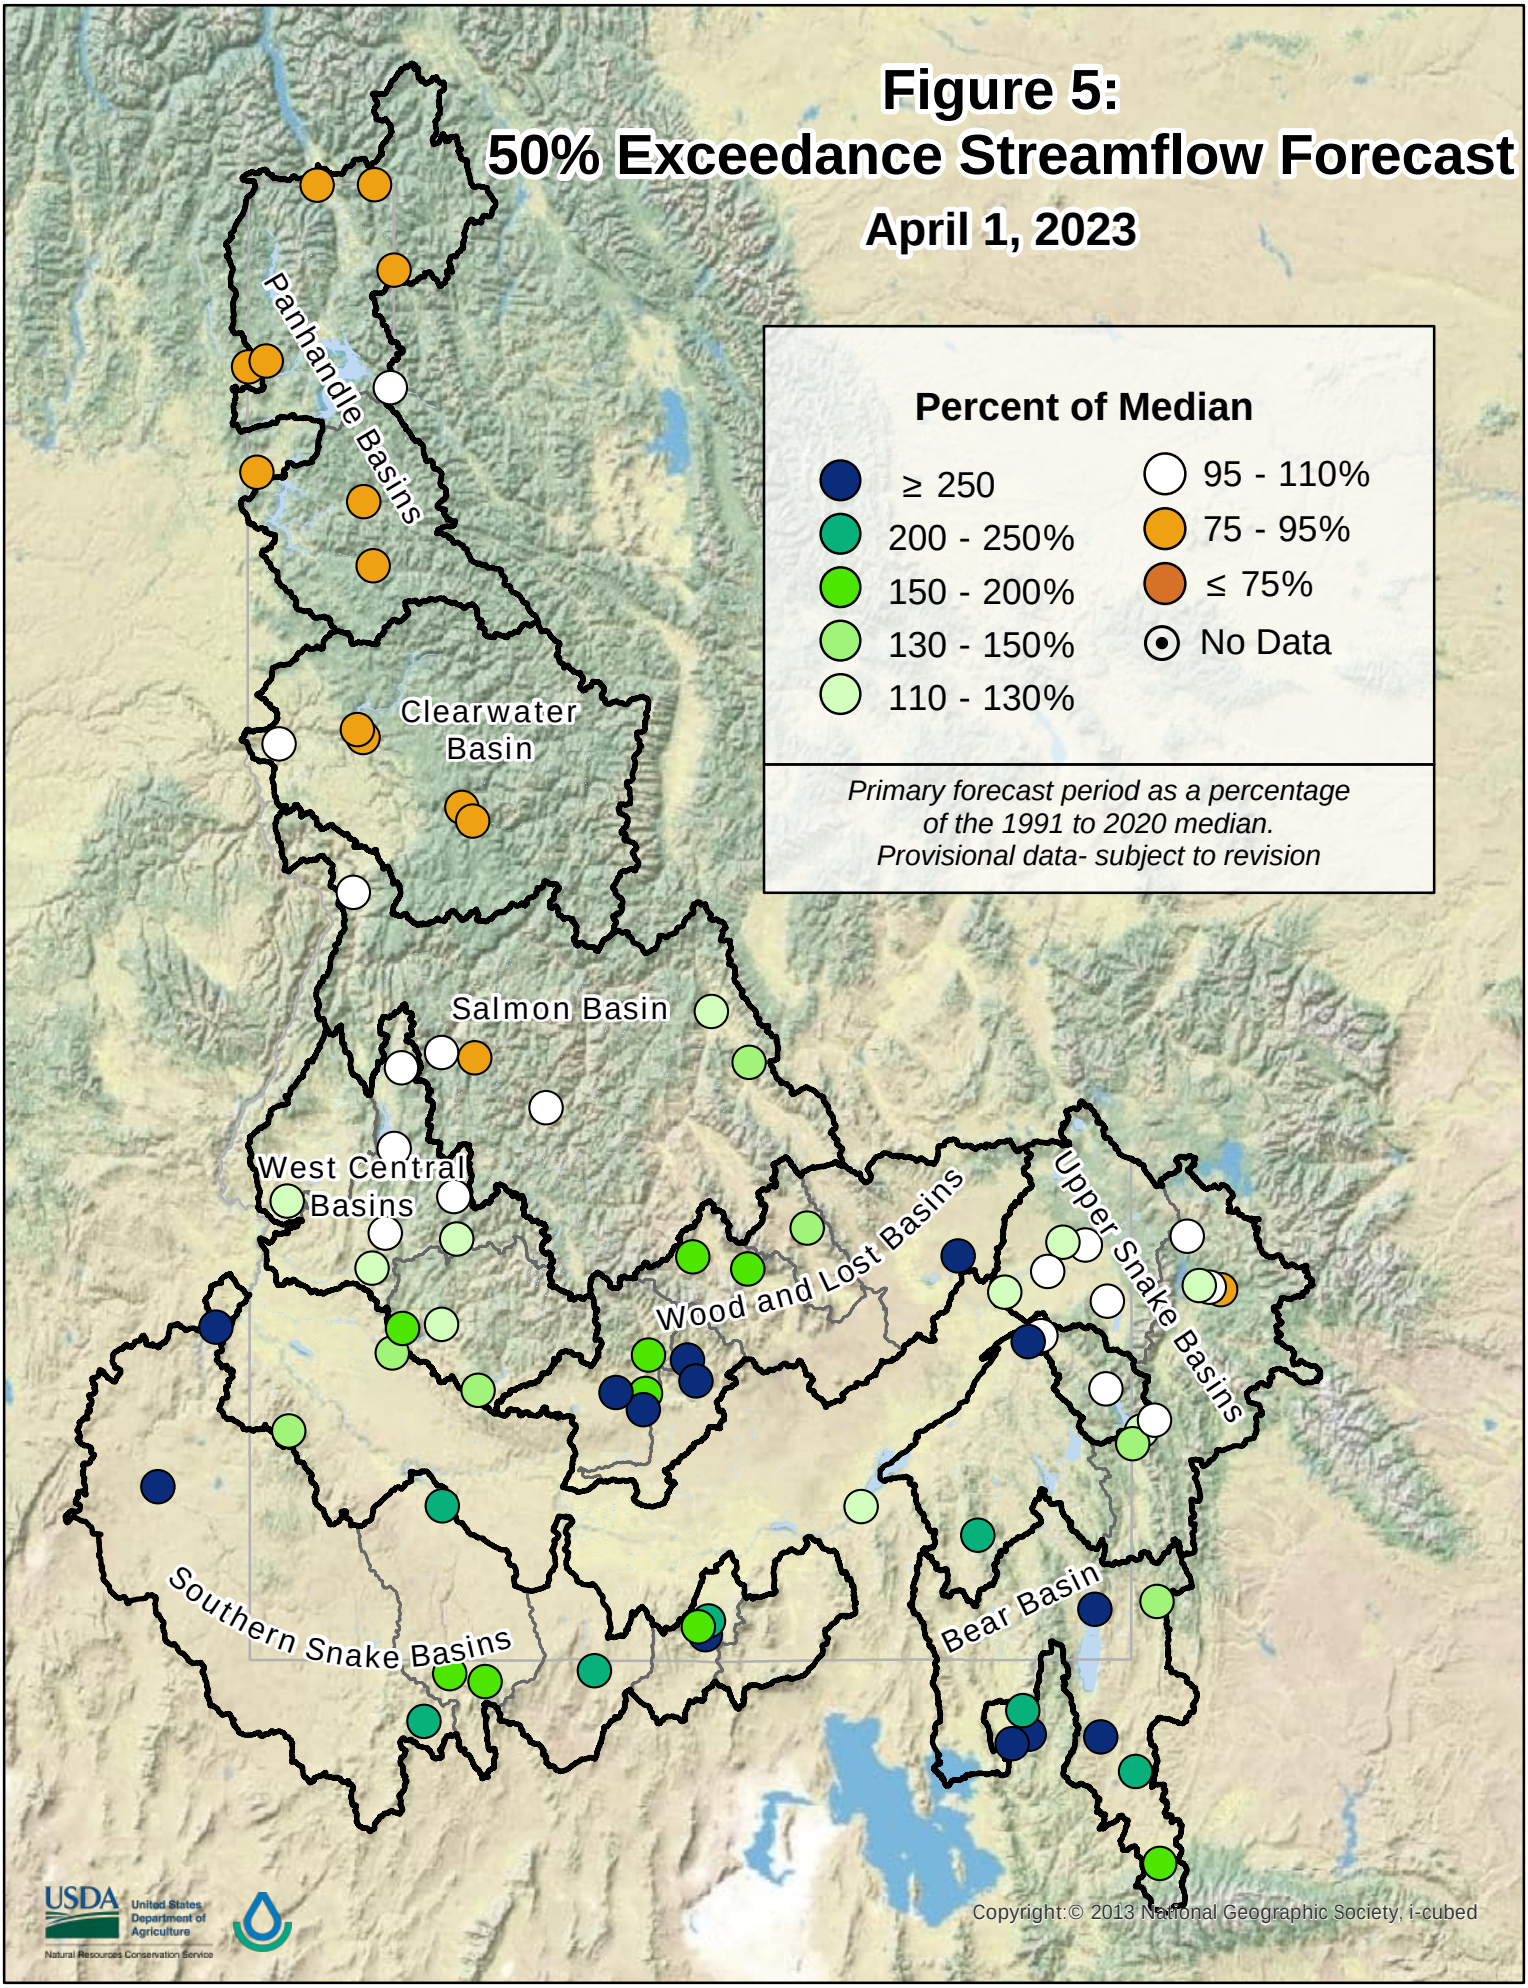
SWSI SCALE PERCENT C ANCE OF E CEE ANCE AN INTERPRETATION





NA=Not Available / Not Applicable; Note: The Percent Chance of Exceedance is an indicator of how often a range of SWSI values might be expected to occur. Each SWSI unit represents about 12% of the historical occurrences. As an example of interpreting the above scale, the SWSI can be expected to be greater than -3.0, 87% of the time and less than -3.0, 13% of the time. Half the time, the SWSI will be below and half the time above a value of zero. The interval between -1.5 and +1.5 described as "Near Normal Water Supply," represents three SWSI units and would be expected to occur about one-third (36%) of the time.

Wood & Lost River Basins

April 1, 2023

WATER SUPPLY OUTLOOK

Monthly precipitation totals for March were well above normal across the Wood & Lost River basins. The Big & Little Wood, as well as the Big & Little Lost basins received ~210 to 230% of normal monthly precipitation, while the Birch-Medicine Lodge basins received 167% of normal (Fig. 1). Water year total precipitation is impressive across the area, and now ranges from ~115 to 135% of normal (Fig. 2). Basin snowpack is spectacular, with all basins between ~135 to 175% of normal for April 1 (Fig. 3). Current snowpack levels greatly exceed the normal seasonal peak snowpack (Big Wood, Little Wood, Big Lost, Little Lost, Camas Creek), and are the highest totals observed since 2017. Snowpack density remains low for this time of year, which is a strong indicator widespread melt and runoff will be delayed this spring.

April 1 reservoir storage is below the 30-year normal for Magic Reservoir (37%) and Mackay Reservoir (86%), while releases are being made from Little Wood Reservoir (51% of normal, 38% full) to make room for significant inflow there. Streamflow forecasts for the Wood and Lost basins are now significantly above normal and range from ~145 to 280% of normal. The median forecast for Camas Creek near Blaine is now 220 KAF (489% of normal!), which is more than enough to fill Magic Reservoir by itself. While the above normal snowpack brings much needed drought relief, it simultaneously carries the potential for spring flooding. If needed, NOAA's Northwest River Forecast Center provides a variety of products related to flood forecasting and awareness.

Wood and Lost Basins Streamflow Forecasts - April 1, 2023

Upper Snake River Basins

April 1, 2023

WATER SUPPLY OUTLOOK

Precipitation fell consistently throughout March as storm after storm hit the region. Monthly precipitation was well above normal for all Upper Snake basins (Fig. 1). Only Buffalo Fork, one of the easternmost sub-basins, received below normal March precipitation. Water year total precipitation in the Upper Snake basins as of April 1 are well above normal; Henrys Fork-Teton is 117%, Snake River above Heise is 107%, and the Willow-Blackfoot-Portneuf is 144% of normal (Fig.2). Snowpack is well above normal in the Upper Snake River with basins ranging from 118 to 179% (Fig.3). NOAA's Official 30-Day Outlook predicts below normal temperatures to continue with no clear precipitation signal.

Storage is 87% of normal for the Upper Snake system. The Jackson Lake and Palisades reservoirs are 57% of normal (36% of capacity), and Henrys Fork-Teton reservoirs are 103% of normal (89% of capacity). With the roughly one million acre-feet deficit that began the winter, we will need well above normal streamflow to return to normal storage. Median streamflow forecasts for the region range from ~93 to 141% for the April to July runoff period. While the above normal snowpack brings much needed drought relief, it simultaneously carries the potential for spring flooding. If needed, NOAA's Northwest River Forecast Center provides a variety of products related to flood forecasting and awareness.

Southern Snake River Basins

April 1, 2023

WATER SUPPLY OUTLOOK

March continued this winter's trend of above normal precipitation across the Southern Snake River basins. Monthly precipitation ranged between ~171 to 211%. Water year total precipitation continued to increase and is ~120 to 129% of normal across these basins. The snowpack is currently well above normal and ranges between ~135 to 226% of normal! Most SNOTEL sites in these basins surpassed the peak annual snowpack with little to no melting taking place yet. The deviation from normal is especially noticeable in the lower elevation areas that typically do not hold onto much snow this late into the season. The current snowpack is below normal density across the region. Less dense snow typically requires more energy input to produce snowmelt runoff, which suggests temperatures need to increase substantially before major runoff begins. However, with spring on our doorstep and the large amount of low-level snow we could see high runoff volumes soon. Comparable water years for each basin are: Owyhee 1982, Bruneau 1983, Salmon Falls 1983, Goose Creek 1983, and Raft 2011 & 2017.

Reservoir storage is below normal across the area, and current storage as a percent of normal is Oakley 71%, Wild Horse 91%, Lake Owyhee 50%, and Salmon Falls 53%. The current volumetric streamflow forecasts are well above normal for the 50% exceedance probability in each basin, they are: Owyhee 280%, Bruneau 195%, Salmon Falls 245%, and Goose Creek 237%. Water supply now looks sufficient in all of these basins.

Streamflow Adjustment List for All Forecasts Published in Idaho Water Supply Outlook Report: Streamflow forecasts are projections of runoff volumes that would occur without influences from upstream reservoirs or diversions. These values are referred to as natural, unregulated or adjusted flows. To make these adjustments, changes in reservoir storage, diversions, and inter-basin transfers are added or subtracted from the observed (actual) streamflow volumes. The following list documents the adjustments made for each forecast point. **(Revised Dec. 2018).**

Reservoir Capacity Definitions (Units in 1,000 Acre-Feet, KAF)

Different agencies use various definitions when reporting reservoir capacity and contents. Reservoir storage terms include dead, inactive, active, and surcharge storage. This table lists the volumes for each reservoir, and defines the storage volumes NRCS uses when reporting capacity and current reservoir storage. In most cases, NRCS reports usable storage which includes active and/or inactive storage. **(Revised Feb. 2015)**

Basin- Lake or Reservoir	Dead Storage	Inactive Storage	Active Storage	Surcharge Storage	NRCS Capacity	NRCS Capacity Includes
Panhandle Region

Interpreting Water Supply Forecasts

Each month, five forecasts are issued for each forecast point and each forecast period. Unless otherwise specified, all streamflow forecasts are for streamflow volumes that would occur naturally without any upstream influences. Water users need to know what the different forecasts represent if they are to use the information correctly when making operational decisions. The following is an explanation of each of the forecasts.

90 Percent Chance of Exceedance Forecast. There is a 90 percent chance that the actual streamflow volume will exceed this forecast value, and there is a 10 percent chance that the actual streamflow volume will be less than this forecast value.

70 Percent Chance of Exceedance Forecast. There is a 70 percent chance that the actual streamflow volume will exceed this forecast value, and there is a 30 percent chance that the actual streamflow volume will be less than this forecast value.

50 Percent Chance of Exceedance Forecast. There is a 50 percent chance that the actual streamflow volume will exceed this forecast value, and there is a 50 percent chance that the actual streamflow volume will be less than this forecast value. Generally, this forecast is the middle of the range of possible streamflow volumes that can be produced given current conditions.

30 Percent Chance of Exceedance Forecast. There is a 30 percent chance that the actual streamflow volume will exceed this forecast value, and there is a 70 percent chance that the actual streamflow volume will be less than this forecast value.

10 Percent Chance of Exceedance Forecast. There is a 10 percent chance that the actual streamflow volume will exceed this forecast value, and there is a 90 percent chance that the actual streamflow volume will be less than this forecast value.

*Note: There is still a 20 percent chance that actual streamflow volumes will fall either below the 90 percent exceedance forecast or above the 10 percent exceedance forecast.

These forecasts represent the uncertainty inherent in making streamflow predictions. This uncertainty may include sources such as: unknown future weather conditions, uncertainties associated with the various prediction methodologies, and the spatial coverage of the data network in a given basin.

30-Year Median. The 30-year median streamflow for each forecast period is provided for comparison. The median is based on data from 1991-2020. The % MED column compares the 50% chance of exceedance forecast to the 30-year median streamflow; values above 100% denote when the 50% chance of exceedance forecast would be greater than the 30-year median streamflow.

AF - Acre-feet, forecasted volume of water are typically in thousands of acre-feet (KAF).

These forecasts are given to users to help make risk-based decisions. Users can select the forecast corresponding to the level of risk they are willing to accept in order to minimize the negative impacts of having more or less water than planned for.

To Decrease the Chance of Having Less Water than Planned for
A user might determine that making decisions based on a 50 percent chance of exceedance forecast is too much risk to take (there is still a 50% chance that the user will receive less than this amount). To reduce the risk of having less water than planned for, users can base their operational decisions on one of the forecasts with a greater chance of being exceeded such as the 90 or 70 percent exceedance forecasts.

To Decrease the Chance of Having More Water than Planned for
A user might determine that making decisions based on a 50 percent chance of exceedance forecast is too much risk to take (there is still a 50% chance that the user will receive more than this amount). To reduce the risk of having more water than planned for, users can base their operational decisions on one of the forecasts with a lesser chance of being exceeded such as the 30 or 10 percent exceedance forecasts.

Forecast use example:

Using the 50 Percent Exceedance Forecast. Using the example forecasts shown on the next page, there is a 50% chance that actual streamflow volume at the Henry's Fork near Ashton will be less than 280 KAF between June 1 and Sept. 30. There is also a 50% chance that actual streamflow volume will be greater than 280 KAF.

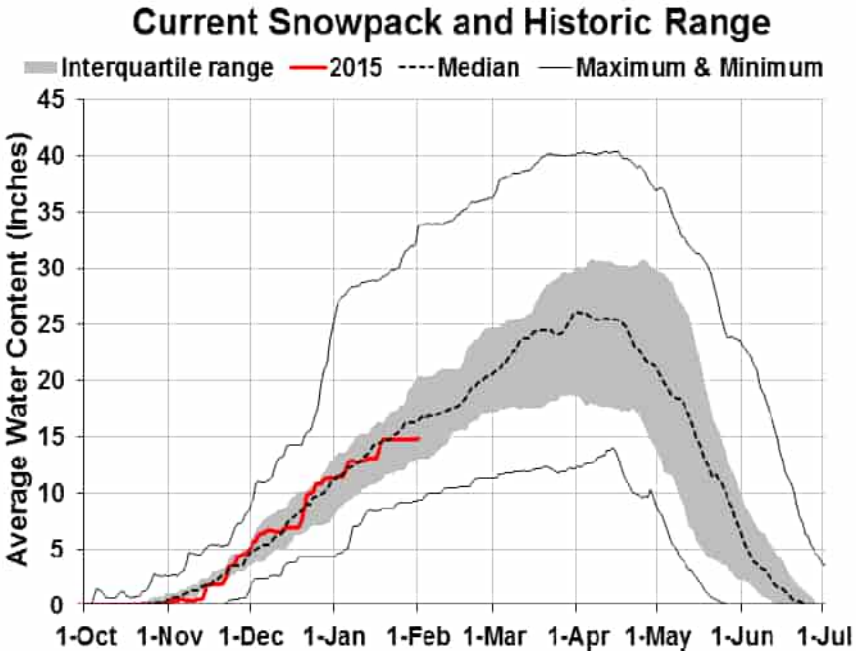
Using the 90 and 70 Percent Exceedance Forecasts. If an unexpected shortage of water could cause problems (such as irrigated agriculture), users might want to plan on receiving 245 KAF during Jun 1 through September 30 (from the 70 percent exceedance forecast). There is a 30% chance of receiving *less* than 245 KAF.

Alternatively, if users determine the risk of using the 70 percent exceedance forecast is too great, then they might plan on receiving 198 KAF (from the **90** percent exceedance forecast). There is 10% chance of receiving less than 72 KAF.

Using the 30 or 10 Percent Exceedance Forecasts. If an unexpected excess of water could cause problems (such as operating a flood control reservoir), users might plan on receiving 315 KAF between June 1 and Sept. 30 (from the 30 percent exceedance forecast). There is a 30% chance of receiving *more* than 315 KAF.

Alternatively, if users determine the risk of using the 30 percent exceedance forecast is too great, then they might plan on receiving 360 KAF (from the 10 percent exceedance forecast). There is a 10% chance of receiving more than 360 KAF. Users could also choose a volume in between any of these values to reflect their desired risk level.

Upper Snake River Basin Streamflow Forecasts - June 1, 2015



Forecast Point	Forecast Period	Forecast Exceedance Probabilities for Risk Assessment ---Drier----------Projected Volume----------Wetter--- 90% (KAF)	70% (KAF)	50% (KAF)	% Avg	30% (KAF)	10% (KAF)	30yr Avg (KAF)
Henrys Fk nr Ashton	JUN-JUL	72	106	129	56	152	186	230
	JUN-SEP	198	245	280	68	315	360	410

Interpreting Snowpack Plots

Basin snowpack plots represent snow water equivalent indices using the average daily SNOTEL data[1] from several sites in or near individual basins. The solid red line (2015), which represents the current water year snowpack water content, can be compared to the normal dashed black line (Median) which is considered "normal", as well as the SNOTEL observed historical snowpack range for each basin. This allows users to gather important information about the current year's snowpack as well as the historical variability of snowpack in each basin.

The gray shaded area represents the interquartile range (also known as the "middle fifty"), which is the 25th to 75th percentiles of the historical daily snowpack data for each basin. Percentiles depict the value of the average snowpack below which the given percent of historical years fall. For example, the top part of the interquartile range (75th percentile) indicates that the snowpack index has been below this line for 75 percent of the period of record, whereas the reverse is true for the lower part of the interquartile range (25th percentile). This means 50 percent of the time the snowpack index is within the interquartile range (gray area) during the period of record.

[1] All data used for these plots come from daily SNOTEL data only and does not include snow course data (collected monthly), whereas the official basin snowpack percent of normal includes both SNOTEL and snow course data, potentially leading to slight discrepancies between plots and official basin percent of normal.

Attorneys for American Falls Reservoir District #2 and Minidoka Irrigation District

BEFORE THE DEPARTMENT OF WATER RESOUCES

OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **SURFACE WATER COALITION'S RESPONSE TO IGWA'S REPLY**

COME NOW, A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGAITON DISTRICT, NORTH SIDE CANAL COMPANY, and TWIN FALLS CANAL COMPANY ("Surface Water Coalition" or "Coalition"), by and through counsel of record, and hereby responds to *IGWA's Reply to SWC's Response to IGWA's Amended Notice of Mitigation* dated June 6, 2023 ("IGWA Reply") as follows.

The IGWA Reply asserts two main points while ignoring whether IGWA has demonstrated that it can comply with existing mitigation plans and the Director's Orders. First, the IGWA Reply effectively states that the Director's Finding of Fact in the *Order Determining Deficiency in IGWA's Notice of Secured Water* ("Order") doesn't mean what it says. As pointed out earlier by the Coalition, the Director explicitly found that the Storage Water Mitigation Plan states "IGWA will mitigate for all ground water users, not just its members and non-member participants." That language would require IGWA to supply the entire injury amount of 75,200 acre-feet.

The IGWA Reply argues that since the Storage Water Mitigation Plan Order states "IGWA's obligation for mitigation shall be determined as set forth in the Methodology Order," IGWA's obligation is reduced to its proportionate share, even though IGWA has never attempted to amend the Storage Water Mitigation Plan Order and no order amending the Plan has been entered to reduce IGWA's obligation to less than what the Plan Order says. IGWA's interpretation is misguided - the amount of total injury is determined by the methodology orders, not IGWA's proportionate share of the Storage Water Plan. If IGWA is relying on the Storage Water Mitigation Plan to mitigate, it must mitigate for all ground water users, not just its members, in order to conform to the wording of the Plan.

Even if IGWA is correct in its interpretation, its mitigation submission is deficient. Under IGWA's interpretation, it would owe 62,635 acre-feet in 2023 mitigation water pursuant to the Storage Water Mitigation Plan. IGWA does not dispute that it also owes 30,000 acre-feet in 2023 to satisfy its obligation for its 2021 breach of the 2015 Settlement Agreement and Order entered by the Director approving that Agreement ("Settlement Agreement Plan"). To adequately

mitigate using IGWA's interpretation, IGWA must show the ability to provide a total of at least 92,635 acre-feet of mitigation water (*See 2022 breach below),* and it has not done so.

In the IGWA Reply, IGWA ignores the Settlement Agreement Plan. IGWA offers no argument as to why it can ignore that Plan, a plan approved by all of IGWA's member Ground Water Districts and approved by the Director. As stated in the *Surface Water Coalition's Response to IGWA's Amended Notice of Mitigation*, IGWA owes 50,000 acre-feet of mitigation storage water to the SWC every year, independent of injury determination. In consideration of this and the other required actions of the Settlement Agreement Plan, IGWA's member Ground Water Districts received safe harbor from all curtailment orders issued since the Settlement Agreement was approved by the Director until 2021, at which time the Director determined the Agreement was breached. To remedy the breach, IGWA agreed to furnish 30,000 acre-feet of storage water to the Coalition in 2023 to stop curtailment in 2022. Further, since 2016 IGWA's member Ground Water Districts have taken advantage of safe harbor, all the while SWC members were facing reduced supplies. Pursuant to the Settlement Agreement Plan and the breach Settlement Order, IGWA must demonstrate it can supply 80,000 acre-feet of mitigation water in 2023 and it has not done so.

Further, the SWC Response points out that IGWA has further breached the Settlement Agreement Plan by failing to submit to the Steering Committee its proposed actions to be taken for the upcoming irrigation season together with supporting information. In addition, a 2022 breach of the Settlement Agreement Plan is pending before the Director and in order to assure in-time, in-place mitigation, it is imperative that the 2022 breach be resolved. Again, SWC members endured short supplies in 2022 and uncertainty in 2023. Breaches of annual obligations impact SWC supplies for years into the future.

It is apparent that IGWA believes it can pick and choose which mitigation plan it can use to satisfy the Director's Orders. As shown in its original notice of mitigation, it attempted to mix and match plans, apparently because member Ground Water Districts could not agree on how to comply with mitigation, a proposal that was rejected by the Director. This was reinforced by the testimony of Lynn Carlquist last week – IGWA's members have not decided how to apportion mitigation obligations among themselves.

As further evidence that at least one Ground Water District's intention is to further breach the Settlement Agreement Plan, attached as Exhibit A is the *Declaration of Alan Jackson in Support of Motion to Stay Based on IDWR's Interference with Lawful Discovery* dated May 31, 2023, filed in the District Court of the Fourth Judicial District of the State of Idaho, Ada County, Case No. CV01-23-8306 ("Jackson Affidavit"). *See* Ex. A. In the Jackson Affidavit, Mr. Jackson states he is the manager of Bingham Ground Water District ("BGWD"). BGWD is a member of IGWA. In paragraph 14 of the Jackson Affidavit, Mr. Jackson states: "The feedback we had received from our patrons is that they would rather face curtailment from the State, than a voluntary curtailment under the newly interpreted settlement agreement" [referring to the Settlement Agreement Plan].

By ignoring the Settlement Agreement Plan and by failing to demonstrate that it can provide adequate mitigation storage water, IGWA is subjecting all of its member districts to a curtailment order pursuant to the provision of the Rules for Conjunctive Management of Surface and Ground Water Resources, IDAPA 37.03.11 ("Conjunctive Management Rules"). IDAPA 37.03.11.040.05 states:

> 05. Curtailment of Use Where Diversions Not in Accord With Mitigation Plan or Mitigation Plan Is Not Effective. Where a mitigation plan has been approved and the junior-priority ground water user fails to operate in accordance with such approved plan or the plan fails to mitigate the material injury resulting from

> diversion and use of water by holders of junior-priority water rights, the watermaster will notify the Director who will immediately issue cease and desist orders and direct the watermaster to terminate the out-of-priority use of ground water rights otherwise benefiting from such plan or take such other actions as provided in the mitigation plan to ensure protection of senior-priority water rights.

CM Rule 40.

The Coalition would certainly prefer that IGWA comply with the Settlement Agreement Plan and the resulting partnership seeking to restore the ESPA groundwater levels. The Coalition has engaged in unsuccessful discussions with IGWA in attempts to amend the Plan and address IGWA's concerns with the Plan. However, if IGWA elects to ignore or breach the Plan, it is the position of the Coalition that the Director must enforce the terms of the Conjunctive Management Rules.

As stated in the Coalition's earlier response, it is the position of the Coalition that IGWA cannot ignore the comprehensive terms of the Settlement Agreement Plan and mitigate only with the Storage Water Mitigation Plan to satisfy its 2023 obligations. Further, IGWA must demonstrate that it can comply not only with the Settlement Agreement Plan, but that it can comply with the 2021 Settlement Agreement, and that IGWA is required to furnish a minimum of 80,000 acre-feet in mitigation water in 2023 to satisfy the storage water portions of the Settlement Agreement Plan and the Settlement Agreement. By failing to do so, IGWA is electing to subject itself to the remedial provisions of the Conjunctive Management Rules.

Attorney for Bingham Groundwater District. (BGWD)

IN THE DISTRICT COURT OF THE FOURTH JUDICIAL DISTRICT OF THE STATE OF IDAHO, IN AND FOR THE COUNTY OF ADA

CITY OF POCATELLO, CITY OF IDAHO FALLS, CITY OF BLISS, CITY OF BURLEY, CITY OF CAREY, CITY OF DECLO, CITY OF DIETRICH, CITY OF GOODING, CITY OF HAZELTON, CITY OF HEYBURN, CITY OF JEROME, CITY OF PAUL, CITY OF RICHFIELD, CITY OF RUPERT, CITY OF SHOSHONE, CITY OF WENDELL, IDAHO GROUND WATER APPROPRIATORS, BINGHAM GROUND WATER DISTRICT, BONNEVILLE-JEFFERSON GROUND WATER DISTRICT, and MCCAIN FOODS USA, INC.,

Petitioners,

vs.

IDAHO DEPARTMENT OF WATER RESOURCES and GARY SPACKMAN, in his capacity as Director of the Idaho Department of Water Resources,

Respondents.

IN THE MATTER OF THE DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY AND FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT,

Case No. CV01-23-8306

DECLARATION OF ALAN JACKSON IN SUPPORT OF MOTION TO STAY BASED ON IDWR'S INTERFERENCE WITH LAWFUL DISCOVERY

NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY

I Alan Jackson, declare and state as follows:

1. I am over the age of 18 and competent to testify. I have personal knowledge of the facts set forth herein and, if called upon as a witness, I could and would competently testify thereto.
2. I am the manager of Bingham Ground Water District (BGWD), a position I have held since April 2017.
3. In the spring of 2022 the SWC asserted that BGWD had breached the mitigation plan agreement because the pumping in 2021 exceeded what they interpreted as an annual limit, which was a baseline established subsequent to the agreement, and in the context of averaging yearly pumping to determine compliance with the mitigation plan.
4. Up to that point it was understood by BGWD that the annual limit would be measured on an average basis because of the difficulty in determining a single year pumping need and reduction. This approach is similar to other components of the agreement, and other agreements with SWC. However, the SWC pursued their claim of breach and ultimately the Director agreed that the plain language of the agreement stipulated an annual limit without averaging or cumulative benefit.
5. The baseline average was not mentioned in the settlement agreement, but the Director adopted it as a yearly limit, despite the fact that it included years where pumping requirements were much higher, and much lower than this baseline.

6. Upon analysis of the impact of an annual limit, which was based on a reduction from the average usage between 2010-2014, BGWD determined that in order to comply with the pumping limit, it would have to cease irrigation on at least as many acres as would have been curtailed during the worst projected demand shortfall. Roughly 30,000 acres, similar to a 1976 curtailment date.
7. The total volume of ground water pumping in BGWD on an annual basis fluctuates significantly depending on the crop water demand. It is expensive to pump water from the aquifer so care is taken to ensure that no more water is pumped than is required. This means that when crop water demands are above average there is very little room to meet a hard pumping limit through pumping reductions without causing crop damage, especially when the limit is based on an average. The only way to stay within limits is to reduce irrigated acres and the loss of planted acres during the season would be devastating to a farm operation. It is impossible to accurately predict the total crop water demand for a growing season so the only way to ensure that a hard pumping limit is met is to assume the highest crop water demand every year and only plant as many acres as are certain to have enough water.
8. The crop water demand in 2021 was among the highest ever which meant that ground water pumping was much higher than the average. Irrigators in BGWD diverted on average about 2 acre-feet per acre which led to a districtwide usage totaling about 60,000 acre-feet greater than the hard pumping limit in the agreement, as interpreted by the Director. Based on the 2 acre-foot per acre average usage BGWD would have had to reduce irrigated acres for the entire season by about 30,000 acres in order to comply with the pumping limit. Comparatively, the in-season demand curtailment in

2021, based on the 4th Methodology Order, would have curtailed 26,650 acres in BGWD with a curtailment date of June 14, 1977. Given the similarity in idled acres every year under both scenarios BGWD determined that the settlement agreement did not in fact offer any safe harbor. In fact the settlement agreement was worse than the result of the 4th Methodology Order because along with the similar acreage reduction it required the acquisition of a significant amount of reservoir storage every year to comply with the terms of the agreement.

9. Throughout the settlement process, BGWD voiced its concerns about the settlement agreement, and that its patrons felt that facing the curtailment each year was actually a better outcome than meeting the demands of the settlement agreement as interpreted by the Director. This was based on the number of acres that would be dried up, the inability to get storage water for mitigation purposes on dry years, and crop insurance implications due to an agreed reduction.
10. Multiple sources reported back to BGWD that this position was interpreted as ignoring any responsibility to the SWC or to help stabilize the aquifer because the Department would not actually curtail. Although this is not the position BGWD took, or had any intention of taking, it became a theme among political and state officials.
11. A meeting was held with department staff, elected officials, SWC and representatives of all other ground water districts to create a straw man for settlement talks. BGWD was the only ground water district not invited. We believe that this is because of BGWD's position on curtailment.

12. During settlement conferences with the SWC, BGWD repeated this comparison often. It was also explained during the winter 2023 negotiations to amend the settlement agreement in the presence of IDWR staff and multiple elected state officials.
13. Prior to beginning one session of the settlement conference, Lt. Governor Bedke had invited Director Spackman to speak. He explained that if people did not believe he would curtail, they would be wrong, because if he ordered curtailment, the department would follow through with it.
14. Again, BGWD took the opportunity to explain that it did not doubt the Director's resolve in issuing a curtailment. On the contrary, we were advising patrons and developing plans to prepare for curtailment if we were not able to mitigate through other means. The feedback we had received from our patrons is that they would rather face curtailment from the State, than a voluntary curtailment under the newly interpreted settlement agreement.
15. The fact that the methodology of using the steady state condition in the ground water model to determine curtailment was no worse than the Director's interpretation of the terms in the settlement agreement was obviously a hindrance to the winter negotiations in which the SWC was calling for even greater pumping reduction and/or more storage mitigation.
16. As depositions have progressed in this case, there has been no new technical evidence presented that would require the Department to switch from the steady state condition in the methodology order, to transient state condition when determining curtailment dates. In fact, the questioning has shown that they knew as much about the impacts of transient vs steady state 7 years ago as they do today. It has also been made clear that

the decision to switch to transient coincides with settlement talks this spring. Why did the Department feel the need for such a drastic overhaul of the methodology order in such a short window without any notice or due process consideration? Furthermore, why is the department limiting Groundwater users from discovering any information related to the Directors decision, other than technical information that seems static and unchanged for years?

17. It is easy to conclude that the Director's decision to switch to the transient model is in direct retaliation to BGWD's position that curtailment is better than the Director's interpretation of the settlement mitigation plan. BGWD patrons feel that they have repeatedly been threatened and manipulated to comply with settlement agreement obligations which are substantially different from what they understood upon entering into the agreement, while the Department is simultaneously implementing a manifold increase in the consequences of curtailment under the 5th Methodology Order. BGWD desires to understand the Director's decision to go to the transient model and any influence from within or without the Department that may have pressured him to so undermine our position in settlement negotiations, but his limitation on Discovery is not allowing us to do so.

I declare under penalty of perjury under the laws of the State of Idaho that the foregoing is true and correct.

Dated May 31, 2023

_/s/ Alan Jackson_____
Alan Jackson,
Manager, Bingham Groundwater District

CERTIFICATE OF SERVICE

I HEREBY CERTIFY that on this 31th day of May, 2023, I caused to be filed a true and correct copy of the foregoing document via iCourt E-File and Serve, and upon such filing, the following parties were served via electronic mail:

Attorneys for American Falls Reservoir District #2 and Minidoka Irrigation District

BEFORE THE DEPARTMENT OF WATER RESOUCES

OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **SURFACE WATER COALITION'S POST-HEARING BRIEF**

COME NOW, A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGAITON DISTRICT, NORTH SIDE CANAL COMPANY, and TWIN FALLS CANAL COMPANY ("Surface Water Coalition" or "Coalition"), by and through counsel of record, and hereby submits its post-hearing brief in response to the Director's instructions and request at the close of the administrative hearing held June 6-9, 2023.

The Director held an administrative hearing on the April 21, 2023 *Fifth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* ("*Fifth Order*") (Ex. 300) and the *Final Order Regarding April 2023 Forecast Supply (Methodology Steps 1-3)* ("*April As Applied Order*") (Ex. 301) on June 6-9, 2023. Various parties had filed requests for hearing and identified statements of issue to be addressed. At the hearing, the Director heard testimony from various lay and expert witnesses and admitted additional exhibits to assist in the review.

At the close of the hearing the Director identified certain questions for the parties to address in post-hearing briefing including:

1) Who bears the burden regarding uncertainty in the information presented (i.e. IDWR, seniors, juniors)?
2) What have the courts told us and what are those standards?
3) What is the appropriate due process for this type of hearing?

The Director recognized that this proceeding involves an on-going delivery call and that material injury has already been determined. The Director noted that there is a presumption that a senior water right holder is entitled to water pursuant to its decree and that groundwater pumping in the ESPA depletes flows to the Snake River that supplies the Surface Water Coalition's senior water rights. The Director further noted that the methodology order is the Department's implementation of the conjunctive management rules ("CM Rules") to evaluate water use by the senior and determine whether some adjustment is appropriate pursuant to the "clear and convincing evidence" standard. Finally, due process must take these factors into account. This post-hearing brief addresses those questions in context as well as the updates to the Fifth Order and additional evidence relevant to the April As Applied Order.

I. Burden of Proof in Conjunctive Administration

The Idaho Supreme Court affirmed the burden of proof and evidentiary standard to apply in conjunctive administration cases in *A&B Irr. Dist. v. Spackman*, 153 Idaho 500, 284 P.3d 225 (2012). In that decision the Court held:

> It is Idaho's longstanding rule that proof of "no injury" by a junior appropriator in a water delivery call must be by clear and convincing evidence. Once a decree is presented to an administering agency or court, all changes to that decree, permanent or temporary, must be supported by clear and convincing evidence.

155 Idaho at 524, 284 P.3d at 224.

The Court also recited the district court's reasoning behind this standard in water right administration which provides further insight into its basis:

> The application of the clear and convincing standard of proof only makes sense from a common sense perspective. If the Director determines that a senior can satisfy the decreed purpose of use on less than the decreed quantity reflected, he needs to be certain to a standard of clear and convincing evidence. In making a determination of whether or not to regulate juniors, the Director is required to evaluate whether the quantity available meets or exceeds the quantity the senior can put to beneficial use. If the Director regulates juniors to satisfy the senior's decreed quantity there is no risk of injury to the senior. However, if the Director regulates juniors to satisfy a quantity less than decreed, there is risk to the senior that the Director's determination is incorrect. There is no remedy for the senior if the Director's determination turns out to be in error and the senior comes up short of water during the irrigation season. **Any burden of this uncertainty should be borne by the junior** . . . [I]f the Director's determination is only based on a finding "more probable than not." The senior's right is put at risk and the junior is essentially accorded the benefit of uncertainty. The requisite high standard accords appropriate presumptive weight to the decree.

155 Idaho at 517, 284 P.3d at 242 (emphasis added).

The above conclusions have guided conjunctive administration in Idaho for well over a decade now. The Director has expressly acknowledged the same in the Fifth Order. *See* Ex. 300 at 33, ¶ 11. The baseline year, its criteria, and subsequent adjustments to in-season demand, take

this standard into account. Therefore, in response to the Director's question it is clear that Idaho courts have placed the burden of "uncertainty" squarely upon junior appropriators for purposes of water right administration. If the Director is unsure as to certain questions, and juniors are going to receive the benefit of out-of-priority diversions, then those juniors must prove defenses by the heightened standard to protect the seniors in times of shortage.

II. Director's Updates to Methodology in the Fifth Methodology Order

The Director first derived the framework for the methodology in the spring of 2010. The original methodology was challenged and litigated through judicial review. *See Memorandum Decision and Order on Petitions for Judicial Review*, Gooding County Dist. Ct., Fifth Jud. Dist., Consolidated Case No. CV-2010-382 (Sept. 26, 2014) ("2014 Order").[1] No party appealed that decision to the Idaho Supreme Court. Since that decision the Director has issued additional updates to the methodology through amended orders. The Fifth Order incorporated new data (2015-2021) not available when the Fourth Order was issued in 2016, and identified the following updates in response.

A. Baseline Year

The methodology's baseline year "is a year or average of years when irrigation demand represents conditions that predict need in the current year of irrigation at the start of the irrigation season." *Fifth Order* at 3, ¶ 7. A baseline year "should represent a year(s) of above average diversions . . . and should also represent a year(s) of above average temperatures and reference ET, and below average precipitation to ensure that increased diversions were a function of crop water need and not other factors . . .[and] actual supply should be analyzed to assure that the BLY is not a year of limited supply." *Id.* at 3-4, ¶ 9. The criteria for selecting a baseline year

[1] A full copy of the court's decision is in the record attached as Ex. A to the SWC's *Motion to Limit Scope of Hearing* (June 5, 2023).

has not changed since the Director issued the *Second*, *Third*, and *Fourth Orders*.[2] However, what has changed is the number of years the Director has available to analyze against that criteria. *See Fifth Order* at 11 ("the years 2000-2021 were considered for the BLY selection").

As a result of the updated data, the Director found that "BLY 06/08/12 no longer satisfies the presumption criteria that total diversions in the BLY should exceed the average annual diversions." *Id.* Consequently, the Director concluded that "total diversions for 2018 adequately protect senior water rights when predicting the demand shortfall at the start of the irrigation season and selects 2018 as the BLY." *Id.* at 12, ¶ 27. IDWR staff recommended changing the baseline year to 2018 in its December 23, 2022 staff memorandum. Ex. 914. The Ground Water Users dispute the use of 2018 and the Director's criteria for a baseline year in the methodology. Various positions were advanced advocating for an "average" year of diversions. *See generally*, Exs. 347A; 837A. The use of an "average" year was previously rejected by the District Court:

> The Director did not err in his intentional adoption of a baseline year based on above average temperatures and evapotranspiration and below average precipitation. The Court agrees that use of such data is necessary to protect senior rights if the Director is going to administer to an amount less than the full decreed quantity of the Coalition's rights. The arguments set forth by the City of Pocatello and IGWA that the Director must use data associate with an average year fail to take into account the legal limitations placed on the Director in responding to a delivery call. . . . As set forth above, using data associated with an average year in order to administer to less than the full decreed quantity of the Coalitions' water rights would not meet a clear and convincing evidenced standard. Therefore, the arguments set forth by IGWA and the City of Pocatello are unavailing.

2014 Order at 33-34.

[2] The Director has updated the baseline year before. In 2016, the Director updated the baseline year from the 06/08 average used in the *Second Order* to a new average of 06/08/12 because at that time "the 06/08 diversions are no longer above average." *See Fourth Order* at 11.

The use of 2018 as a baseline year is further supported by the data showing increased water demand in recent years. For example, since 2012 seven out of ten years have experienced below average growing season precipitation. *See Fifth Order* at 4. Over that same period nine out of ten years have experienced above average number of growing degree days. *See id.* at 7. Coupled with increases in higher consumptive use crops like corn and alfalfa, it is clear that the Coalition has witnessed increased water demands from their shareholders and landowners.[3] *See generally* Ex. 1 (pp. 4-9); Ex. 4 (pp. 7-11); *Barlogi Test.* Whereas junior groundwater users have the benefit of a firm water supply every year, it is appropriate to guard against dry and hot conditions for the senior by using the criteria selected by the Director. The 2018 baseline year is only one of two years that fit the methodology criteria and therefore it was appropriate for the Director to update the methodology. *See* Ex. 4 (p. 15).

B. Transient Use of ESPAM

The Eastern Snake Plain Aquifer Model (ESPAM) Version 2.2 has been adopted by the Eastern Snake Plain Hydrologic Modeling Committee (ESHMC) and has been used by IDWR in conjunctive administration, including in response to the Coalition's delivery call. *See* Ex. 3 (p. 3); *see also*, *Clear Springs Foods, Inc. v. Spackman*, 150 Idaho 790, 814, 252 P.3d 71, 95 (2011). Although certain consultants raised questions concerning ESPAM 2.2, the juniors did not carry their burden to show that the model is unreliable or cannot be used for conjunctive administration. *See e.g. Final Order* at 24-25 (Docket No. AA-WRA-2021-001) (June 28, 2021) (Director noting that junior ground water users carried the burden to prove by clear and convincing evidence that groundwater model could not be used for administration).

[3] For purposes of the CWN crop mix calculator, IDWR should go back and adjust each year once that data becomes available to ensure the 3-year average is up to date. *See* Ex. 4 (pp. 8-9).

The Director identified how the ESPAM groundwater model has been and can be run to identify a curtailment date for junior groundwater rights causing material injury. *See Fifth Order* at 29-30. If a ground water right is not covered by an approved and effectively operating mitigation plan, then curtailment is the Director's only remedy to prevent material injury to the senior right. *See* CM Rule 40.05.

A steady-state analysis analyzes the impact of curtailment on the aquifer and connected river reaches long-term (i.e. 50 years), whereas a transient analysis predicts the timing of changes that would occur during the irrigation season. *See id.* at 30. The Director acknowledged that only "9% to 15% of the steady state response is predicted to accrue to the near Blackfoot to Minidoka reach between May 1 and September 30 of the same year." *See id.* In other words, if curtailment is based upon a steady-state analysis, it severely under-mitigates a predicted injury to the Coalition's senior water rights. Consequently, the Director adopted a transient analysis as being "necessary to simulate the short-term curtailments prescribed in the methodology."[4] *Id.* at 31.

The Director's transient use of ESPAM 2.2 is appropriate for calculating the in-season reach gains to the Near Blackfoot to Minidoka reach that would result from the curtailment of groundwater pumping. *See* Ex. 3 (p. 3). No expert testified that a steady-state run would fully mitigate the forecasted demand shortfall. The Director's transient use of the model to identify a curtailment date that would mitigate the in-season demand shortfall conforms to judicial precedent on this issue as well. *See Memorandum Decision and Order*, *Rangen, Inc. v. IDWR*, Twin Falls County Dist. Ct., Fifth Jud. Dist., Case No. CV-2014-4970 (June 1, 2015); *Memorandum Decision and Order*, *Rangen, Inc. v. IDWR*, Twin Falls County Dist. Ct., Fifth

[4] Such a finding is consistent with the Director's approval of mitigation plans where he allows the delivery of storage equal to the amount of an injury finding.

Jud. Dist., Case No. CV-2014-2446 (Dec. 3, 2014); *see also*, *Amended Final Order Regarding Compliance with Approved Mitigation Plan* at 17-19 (Docket No. CM-MP-2016-001, Apr. 24, 2023). Stated another way, if junior water users cannot mitigate the predicted in-season demand shortfall, Idaho law does not contemplate curtailment that would only supply between 9-15% of that shortfall during the irrigation season. In sum, the Dirctor's transient use of the model is required by Idaho's prior appropriation doctrine and is supported by the record. If juniors desire to pump out-of-priority and cannot replace the predicted in-season shortfall as required, curtailment must be sufficient to mitigate that shortfall during the irrigation season. A steady-state use of the model does not identify the proper curtailment date for that purpose.

III. Twin Falls Canal Company Water Use / Irrigated Acres

In his ruling following the 2008 hearing, the Hearing Officer (former Chief Justice Gerald Schroder) concluded:

> The evidence does not show substandard facilities for diversion or conveyance. The members of the Surface Water Coalition have improved their conveyance practices since the time the water rights were licensed or decreed. . . .
>
> There are various factors that might be considered that cause difference in the efficiency of diversion and conveyance within the irrigation districts. For example, the North Side Canal Company is very long, requiring more time for water to move from the initial diversion to the end of the system. There will be differences in the amount of evaporation and potentially of conveyance losses. Additionally, if the delivery of water at the beginning of the system is shut off, when the water is again turned on it takes considerable time for water to reach the far end of the system. Damage to the crops may occur during the delay. This simply says that there is no precise formula that can be applied from one SWC member to another. Differences exist. This does not mean that one district is using reasonable facilities and practices and another not. There is no evidence of decayed or damaged systems that are allowed to continue or practices that cause water to be wasted in transit. The evidence in this case indicates that each of the SWC members is operating with reasonable diversion and conveyance efficiency.

R. Vol. 37 at 7101-02.

This finding was echoed by the District Court on judicial review of the first methodology order:

> Furthermore, both the Hearing Officer and the Director found, in considering the Rule 42 factors, that the Coalition members operate reasonable and efficient irrigation projects. The Director found that "as found by the hearing officer in his recommended order, members of the SWC operate reasonably and without waste," and hat he will not "impose greater project efficiencies upon members of the SWC than have been historically realized."

2014 Order at 30-31.

The evidence at the June 6-9, 2023 hearing further showed that the Coalition members continue to operate reasonable and efficient irrigation projects. Specifically, TFCC's manager Jay Barlogi provided testimony about the company's water delivery operations as well as recent maintenance and conservation projects. *See generally*, Ex. 1 (pp. 3-23). Mr. Barlogi noted the increase in consumptive use crops across the project and how changes to sprinkler and residential use have created operational demands within the TFCC system. The company has implemented a number of projects to keep pace with operational demands and continues to look at ways to improve delivery and maintenance of the canal system. In other words, there was no evidence of "decayed or damaged" systems or water being wasted on the TFCC project.

That TFCC continues to put water to beneficial use and use water reasonably was confirmed by Mr. Barlogi as well. Mr. Barlogi described a general overview of operations for the irrigation season which is supported by the Director's previous finding that although crop water needs may vary, water is still put to beneficial use at these times. *See* Ex. 1 (pp. 4-8); *see also Order on Reconsideration of Final Order et al.* at 4, ¶ 16 (June 16, 2010) ("Computing a seasonal Ep that is weighted to monthly CWN is misleading because the computation ignores or dampens the effects of beneficial diversions of water necessary to rear crops that lie beyond simply meeting the consumptive requirement of the plant (i.e. canal charging, availability of a

steady supply of water, chemigation, soil tillage, etc.)"). These beneficial uses were supported by the testimony of the Coalition's experts in evaluating project efficiencies as well. *See* Ex. 4 (pp. 7-13).

Increased consumptive use crops (i.e. corn, alfalfa), as well as double-cropping, have an impact on water demands. *See* Ex. 1 (pp. 7-9); Ex. 4 (pp. 10-11). A review of Water District 01 delivery records confirms that TFCC operates within an accepted acre-feet per acre standard demonstrated by other large open canal systems within the district. *See* Ex. 8. Watermaster Tony Olenichak further testified that it was his opinion that TFCC operated and delivered water in a reasonable manner. *See generally, Olenichak Test.* This opinion was supported by other expert witnesses that testified at the hearing. *See Brockway Test.*, *Shaw Test.* On the other hand, the ground water users did not prove by clear and convincing evidence that TFCC was not putting water that it diverts to beneficial use. Even the exhibit offered by the Cities' consultant showed that measured returns in certain coulees across the TFCC project had remained stable (close to 50,000 acre-feet) and have even decreased over the last three years.[5] *See* Ex. 365.

There was considerable testimony concerning the number of irrigated acres within the TFCC project. The legal status of TFCC's decreed place of use (including the number of authorized acres) and the presumption IDWR must apply is outlined in the Step 1 letter from counsel to Director Spackman dated March 29, 2013. *See* Ex. 938. TFCC submitted an irrigated area shapefile to IDWR in 2013 and since then has sent letters confirming that the acreage has no changed by more than 5% from the prior year.

IDWR staff Matt Anders testified that IDWR previously used 183,589 acres in its irrigated acreage calculations before 2015. *See Anders Test.* This may have been based upon an

[5] The trend is similar for the "tributary gages" which include both natural streamflow and some irrigation return flows during the irrigation season. Certainly the type of water year will influence water availability and the amount of water identified in the flow measurements.

erroneous acceptance of a report presented at the 2008 hearing. *See* Ex. 938 (3/29/13 letter to Director Spackman noting the errors in the 2007 SPF report and fact that it was not adopted by the Hearing Officer). Further, IDWR did not have the benefit of the Court's 2014 Order and confirmation about how the Department must apply the "clear and convincing evidence" standard in conjunctive administration, particularly in application of the methodology.

The Coalition's expert report details issues with the 2017 irrigated lands dataset. *See* Ex. 4 (pp. 1-2). A review of that shapefile overlaid on 2021 aerial imagery shows lands that are irrigated have been removed and classified as "non-irrigated." *See* Ex. 6. Whereas the status of certain lands can change from year to year, and water can be transferred within the TFCC project, identifying exact irrigated acreage in the current year can be a challenge, particularly on a project TFCC's size. With the status of information that it had, IDWR properly relied upon its review of TFCC's 2013 shapefile and the juniors did not carry their burden to show by clear and convincing evidence a different number was justified.

Regardless of the irrigated acreage number and its application in the CWN calculator, a reduction in acreage does not automatically reduce demand or beneficial use of TFCC's water right. TFCC's manager explained that increased consumptive use crops, longer growing seasons, and even double-cropping, have all contributed to increased demands. Ex. 1 (pp. 8-9). Further, conversion to sprinklers have reduced historical returns back to the canal system, reducing water available for reuse. *See id.* (pp. 24-25). Although fewer acres may be irrigated, that would only slightly reduce overall project efficiency and not mean that less water is required for successful canal operations. Ex. 4 (pp. 13-14).

IV. AFRD#2 Baseline Year Diversion Volume

On rebuttal testimony the last day of the hearing (June 9), Matt Anders clarified an error regarding AFRD#2's total diversion volume in 2018. Evaluation of certain recharge water showed that the total volume diverted by AFRD#2 for its irrigation purposes was understated. IDWR should correct the 2018 baseline year data for AFRD#2 accordingly.

V. A&B Surface Water Delivery to Converted Lands / Proportionate Share in April As Applied Order

The April As Applied Order identified A&B's proportionate share of the projected in-season demand shortfall to be 458 acre-feet. *See* Ex. 301 (p. 5, n. 5). This calculation was made using a steady-state run of ESPAM to apportion respective responsibility for the shortfall and mitigation obligation. *See Sukow Test.*

A&B Irrigation District now delivers surface water to 3,576 acres that were formerly solely irrigated with groundwater. *See* Ex. 2. While successful operation of its pipeline requires certain groundwater use for pressurization, the lands are primarily supplied by surface water. It appears that IDWR created the "proportionate share" table using a simulated curtailment of A&B's water rights junior to December 30, 1953. *See April Background Information* (excel spreadsheet).[6] The simulation used a crop irrigation requirement of 2.59 acre-feet per acre and assigns a value of 10,629 acre-feet to the 4,107.9 acres authorized under the District's junior priority water rights (36-15127A et al.). Since A&B has replaced groundwater with surface water delivery on certain lands, that should be taken into account when analyzing the proportionate share of any in-season demand shortfall predicted for the Surface Water Coalition. *See* Ex. 2. In other words, the District is not pumping 10,629 acre-feet for those lands every year as identified in IDWR's background information.

[6] Available at: https://idwr.idaho.gov/legal-actions/delivery-call-actions/SWC/

VI. Non-Participation in Water District 01 Rental Pool.

The Fifth Order notes that "water supplied to private leases or to the rental pool by a SWC member will be included as part of the SWC supply for that member because non-inclusion would unjustifiably increase the shortfall obligation." Ex. 300 at 13, ¶ 30. Questions arose in 2022 as to whether or not an injured Coalition member could receive an assignment of mitigation storage if that member was not a "participant" in the Water District 01 rental pool. *See SWC Request for Status Conference* at 3-5 (Apr. 27, 2022).

Tony Olenichak provided testimony at the hearing that a Coalition member could receive an assignment of storage water for mitigation purposes even if that member was not a participant in the rental pool. *See Olenichak Test.* The Director should clarify that fact going forward so that if a Coalition member decides to not participate in the rental pool in a given year, that would not preclude assignment of mitigation storage water if necessary, either as part of an approved mitigation plan or for delivery to mitigate injury.

VII. Due Process Concerns Addressed.

Finally, in response to the Director's note at the close of the hearing, while certain parties alleged concerns with the timing of the proceeding and schedules, all parties were subject to the same deadlines. Further, the unique issues related to timely water right administration in this case were explained as follows by the District Court:

> That segues us into issues pertaining to due process. Petitioners raised due process concerns pertaining to the hearing process utilized by the director for the administrative hearing to commence June 6th. In evaluating the due process concerns raised by the petitioners, the Court must be cognizant of the director's duty to timely administer water rights in priority. The Idaho Supreme Court instructed in Musser vs. Higginson that the director's duty to administer water is clear and executive. Time is of the essence in water administration. In any given year the reality is, there is a short timeframe between when water supply determinations can be made and when water users' demands for irrigation water begin. Any process employed by the director must account for the exigencies of

these time constraints. These exigencies were recognized by the drafters of our Constitution as set forth in the Idaho Supreme Court and American Falls Reservoir District Number 2. The Court found the drafters intended that there be no unnecessary delay in the delivery of water pursuant to a valid water right and that a timely response is clearly required when a delivery call is made and water is necessary to respond to that call. That's AFRD Number 2, 143 Idaho at 874. This analysis recognizes the failure of the director to timely administer in priority can result to senior rights in times of shortage. In conjunction, the Idaho Supreme Court further determined that neither the Constitution nor the statutes place any specific time frames on this process.

In this case the record reflects the Department began notifying individuals in September, 2022, that it would be reviewing data used in the Fourth Methodology Order. In November and December, 2022, the Department conducted six meetings regarding possible amendments to the Fourth Methodology Order where staff presented new data and analyses with respect to methodology. Later in December the Department released a document setting forth preliminary recommendations for amendments to the Fourth Methodology Order. The preliminary recommendations stated that the Department will continue to evaluate the integration of these recommendations and others into the methodology. The recommendations also invited outside consultants to submit written comments by January 16, 2023, which some outside experts did by submitting preliminary comments.

On April 21st, 2023, the director issued the Fifth Amended Methodology Order and Final Order regarding the April, 2023, forecast supply. In the final order regarding the April, 2023, forecast supply, the director predicted an in-season demand shortfall to the Twin Falls Canal Company in the amount of 75,200-acre feed. The order gave affected juniors until May 5, 2023, to establish they can mitigate for their proportionate share of the predicted demand shortfall. For those juniors who could not, the order stated that the director would issue a curtailment order.

The director did not hold a hearing prior to issuing the April 21st, 2023, orders. However, he has set a hearing --and he has set a hearing to commence June 6th, 2023, on the orders pursuant to Idaho Code Section 42-1701A(3). Idaho Code Section 42-1701A(3) governs hearings before the director. Subsection 3 applies where the director takes action without a hearing. Normally a party has 15 days to request a hearing under Subsection 3. However, because the director found time was of the essence and because he anticipated multiple parties would request a hearing, he took the proactive step of sua sponte noticing up a hearing to save time. He also set a prehearing conference for April 28th, 2023. The director subsequently denied a request from the petitioners to continue the June 6th hearing until December or January. He also denied a request from the petitioners to appoint an independent hearing officer. On May 2nd, 2023, the director issued a scheduling order, directing that discovery be completed by May 31st, 2023. Then on May 5th, 2023, the director issued an order limiting discovery to preclude questions regarding the director's deliberative process. Okay. Again, on May 2nd, 2023, the director issued a scheduling order, directing that discovery be

> completed by May 31st, 2023. Then on May 5th, 2023, the director issued an order limiting discovery to preclude questions regarding the director's deliberative process on legal and policy considerations. Okay. So in evaluating the process in this case against the director's duty to timely administer water rights in priority, the Court finds it provides due process consistent with the exigencies of the circumstances and the need to administer water in priority to avoid injury to senior rights.
>
> In making this finding, the Court is influenced by the fact that administration in this case arises in the larger context of an ongoing delivery call that has existed since 2005. The director issued its first methodology order in 2010. Since then, the methodology order has been modified and amended three times to account for new data, modeling revisions, and climate trends. So this is not a new issue. And the director gave heads-up that amendments may be required again in 2023, starting in September of 2022, when he notified individuals that the Department was investigating integrating new data techniques into the methodology order. Again, he then conducted a series of meetings, presenting new data and techniques, and issued a preliminary recommendation setting forth proposed amendments and inviting comment from outside experts. In effect, the parties were put on notice starting in September of 2022 that amendments to the methodology order were being considered. Based on prior actions within the context of this ongoing delivery call, parties were also well-aware of the exigent time constraints following demand shortfall predictions. In particular, in its memorandum decision issued on April 11, 2011, in Gooding County Case CV-2010-382, the Court addressed similar due process arguments concerning short timeframes for notice and discovery in the context of this very call. The process provided then was found to provide due process. In this instance the parties are being provided with a hearing on the 2023 orders to commence on June 6th. They were provided approximately six weeks actual notice for the hearing.
>
> In addition, the director began making parties aware that amendments to the methodology order were being considered back in September of 2022. At the hearing on June 6th the parties will be given the opportunity to present evidence and arguments pertaining to the 2023 orders. The Court finds this process provides due process consistent with the exigencies of the circumstances and the director's duty to timely administer water rights in priority. And frankly, setting a hearing after the irrigation season as requested is not a tangible alternative, given the director's duty and the demand shortfall prediction for the 2023 irrigation season.

Transcript, June 1st Hearing, *IGWA et al. v. IDWR*, Ada County Dist. Ct., Fourth Jud. Dist., Case No. CV01-23-8187.

Based upon the above, the parties were provided the necessary due process in this proceeding, and any allegations of the Director violating constitutional rights are unfounded given the unique circumstances regarding conjunctive administration.

CONCLUSION

The Coalition submits the above post-hearing brief on the issues identified.

DATED this 16th day of June, 2023.

Attorneys for the Cities of Bliss, Burley, Carey, Declo, Dietrich, Gooding, Hazelton, Heyburn, Jerome, Paul, Richfield, Rupert, Shoshone, and Wendell ("Coalition of Cities")

BEFORE THE DEPARTMENT OF WATER RESOURCES

OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	**Docket No. CM-DC-2010-001** **CITY OF POCATELLO, CITY OF IDAHO FALLS, AND COALITION OF CITIES' CLOSING BRIEF**

The City of Pocatello, City of Idaho Falls, and Coalition of Cities[1] ("Cities"), by and through their undersigned counsel, hereby submit their *Closing Brief* in the above captioned matter. The Cities' *Closing Brief* will focus on areas of the *Fifth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* ("Order"), issued by the Director of the Idaho Department of Water Resources ("IDWR" or "Department") on April 21, 2023, that merit revision based on evidence presented during the June 6-9 hearing.

[1] The Coalition of Cities is composed of the Cities of Bliss, Burley, Carey, Declo, Dietrich, Gooding, Hazelton, Heyburn, Jerome, Paul, Richfield, Rupert, Shoshone, and Wendell.

Introduction

At the close of the hearing, the Director made the following comment, in the context of providing some guidance on topics to be covered in the closing briefs:

> And then I think -- associated with that, I think there's also a question about burdens of proof. In other words, in the conjunctive -- and I don't know the answer to this, necessarily, but under the conjunctive management rules, who bears the burden of establishing, by clear and convincing evidence, what those adjustments should be? Is it the Department's burden? Is it the senior burden? Or is it the junior burden?

Vol. IV Tr. at 203:14-22. This *Closing Brief* focuses on modifications to the *Order* that the Cities believe the Department should make based on "clear and convincing" evidence; it also takes issue with the Department's imposition of transient modeling.[2] As for who bears the burden: the Department bears the initial burden of determining the basis for administration. If the Department proposes to administer water rights in a manner that is at variance with the senior's decree, it must on its own determine what is "clear and convincing." On issues such as irrigated acres and project efficiency, the Department has taken the easy road—it has used acreage values provided by the Surface Water Coalition ("SWC") members themselves and refrained from analyzing the reasonableness of SWC members' project efficiencies, which would require revisiting the 2008 determinations of Justice Schroeder.

In a hearing such as this, where the juniors are challenging the bases of the *Order*, the juniors bear the burden of showing by "clear and convincing" evidence that the Department/SWC values are incorrect. This is supported by a prior decision of Judge Wildman:

> [I]f the junior users believe for some reason that the seniors will receive water they cannot beneficially use, it is their burden under the established evidentiary

[2] The Director's remarks at the close of the fourth day of hearing also seemed to reflect the sentiment expressed by Judge Wildman at the June 1 arguments related to IWGA and the Cities' complaints for judicial review and requests for extraordinary writs: it is difficult to understand why the Department couldn't have taken a more measured approach on any shift in modeling for purposes of curtailment, for example, to hold a hearing on this topic during the winter months.

> standards . . . to prove that fact by clear and convincing evidence. For example, the juniors may assert that the Director in their opinion is considering some, but not *all* acres that are no longer irrigated by the seniors.

Memorandum Decision and Order on Petitions for Judicial Review (Case No. CV-2010-382, filed Sept. 26, 2014) at 31. In acknowledging this standard, however, it bears noting that "clear and convincing" evidence is not an impossible bar to breach—notwithstanding the attitude of the SWC and apparent viewpoint of the Department—but it is simply a higher standard than preponderance. For example, there was testimony at the hearing from Department staff and the SWC's expert that Twin Falls Canal Company's ("TFCC") 2013 irrigated acreage data contains "hardened" acres. It is hard to know how admissions against interest like these could be anything *but* clear and convincing evidence.

A further point is that if the juniors bear this burden—and the Cities acknowledge that they do to the extent they are challenging a determination in the Department's *Order*—they need time to prepare for a hearing. Flippant suggestions that the parties have been sitting around preparing for a hearing for the last period of months are no substitute for due process; nor is the dismissal of a request for extraordinary relief by the District Court (which should not be read as anything other than what it was).

Finally, the Cities urge the Department to stay true to its word that it has an "ongoing obligation to use the best available science and information." Ex. 300 at 2. Because the Department has chosen to, *inter alia*, accept irrigated acreage data from SWC members without any scrutiny, omit 2022 data in the *Order*, and refrain from analyzing the reasonableness of SWC member's project efficiencies, the Cities feel strongly that the Department has fallen short of meeting this obligation. Accordingly, the Cities request that the Department revise the *Order* as described below.

I. The Department Must Correct the SWC's Irrigated Acreage Amounts Because they are Erroneous and Overstate the SWC's CWN.

The Department must revise the *Order* to incorporate irrigated acreage data that accurately reflects SWC-member irrigation. During trial, Mr. Anders, the Department's lead on technical revisions from the *Fourth Methodology Order* to the *Fifth Methodology Order*, testified that the *Order's* quantification of TFCC's irrigated acres (194,732 acres) includes "hardened acres," which cannot be irrigated, as well as partially irrigated acres; he also admitted that the *Order's* quantification of A&B Irrigation District's irrigated acres includes A&B's 1994 enlargement/water spreading acres. Mr. Anders also testified that IDWR has not looked for enlargement/water spreading acres within other SWC boundaries.

Moreover, accurate acreage values are available in the form of IDWR irrigated land datasets, developed by the Department for, *inter alia,* calibration of the ESPAM. *See* Testimony of Mr. Anders. The Director accepted into evidence the SWC's Expert Report, Exhibit 4, which identifies three different Department-prepared data sets—IDWR 2011 Delineation, IDWR 2017 Delineation, and an acreage dataset associated with NRT METRIC.[3] The Department's irrigated acreage datasets demonstrate that TFCC has been irrigating between 179,000 and 181,000 acres in recent history. Ex. 4 at 3. Mr. Sullivan's testimony established that the Department's irrigated acreage datasets more accurately depict the amount of acres that the Twin Falls Canal Company ("TFCC"), Burley Irrigation District, and Minidoka Irrigation District irrigate than the acreage values used in the *Order* on p. 10 at paragraph 22. The Cities' Expert Report demonstrates that using more accurate irrigated acreage data could reduce TFCC's reasonable in-season demand ("RISD") by a magnitude of 96,000 acre-feet. Ex. 347A at 18-19. Thus, for those SWC

[3]NRT METRIC stands for "near real time" METRIC, and refers to a method of determining crop consumptive use under evaluation by the Department in "near real time."

members who irrigate less acres than the amounts in the 2013 shapefile or their decreed acreage amounts, paragraph 22 of the *Order* should be revised so that the irrigated acreage amounts match those used in the Department's 2017 data set.

The Idaho Supreme Court has stated that "the Director 'has the duty and authority' to consider circumstances when the water user is not irrigating the full number of acres decreed under the water right." *A&B Irrigation v. Spackman (In re A&B Irrigation Dist.),* 155 Idaho 640, 652 (2013) (quoting *Am. Falls Reservoir Dist. No. 2 v. Idaho Dep't of Water Res.* ("*AFRD#2*"), 143 Idaho 862, 876 (2007)). The Department's use of the acreage values in paragraph 22 of the *Order* (which erroneously includes non-irrigated acres and junior acres) in determining the SWC's crop water need ("CWN") results in CWN values that are significantly overstated.[4] Further, use of this inaccurate irrigated acreage data for Methodology administration results in the Department determining shortages associated with acres that the SWC members cannot beneficially irrigate, which is contrary to law. *See, e.g., A&B Irrigation,* 155 Idaho at 652; IDAPA 37.03.11.020.03.

II. The Department's Reliance on Historical Average Project Efficiencies is Flawed and Overstates the SWC's RISD.

The Department's use of historical average project efficiencies to calculate RISD under Steps 6-9 is flawed because it fails to consider whether SWC members' operations are reasonably efficient. While Justice Schroeder concluded at the end of the 2008 hearing in this matter that SWC members were operating reasonably efficiently, the Department has not made (and does not make) evaluations of SWC system efficiencies as part of the Methodology Order since.[5] Even

[4] Further, the use of accurate irrigated acreage data demonstrates that key Methodology assumptions (e.g., that TFCC's operations are reasonably efficient) based on the 2008 hearing in this matter are no longer true.
[5] The Cities were prepared to conduct the same type of operational evaluations that were performed prior to the 2008 hearing to develop evidence to test the Department's assumption that operations that were efficient in 2008 are still

the SWC's expert, Dr. Brockway, agreed that the reasonableness of an appropriator's irrigation operations is based on "current industry standards or current state of the art." Vol. IV Tr. at 130:2-16. As Mr. Sullivan testified, "current industry standards or current state of the art" have changed in the past 15 years because of continued sprinkler conversions and advances in irrigation technology and management. Thus, project efficiencies that may have been reasonable in the past may be unreasonable now or in the future as conditions change; and since the SWC delivery call is an ongoing proceeding, with the requirement to use the best available science, it is correct to periodically review efficiencies to ensure they are reasonable and result in reasonable computed diversion demands.

The *Order*, on pp. 13-14, enumerates the monthly "project efficiencies" for each SWC member in paragraph 32. The methods used to determine project efficiencies (or "E_p") in the *Order* assume a linear relationship between diversions and CWN, in other words, that diversions (or RISD) linearly rise and fall with changes in CWN. However, as Mr. Sullivan showed in his Expert Report (*see* section 3.2 and Figures 3-4 through 3-11), the reality is different—in fact, in many months there is a weak correlation between SWC diversions and changes in CWN. In other words, some SWC members seemingly divert water based more on availability rather than CWN, often resulting in diversions in excess of what is reasonably necessary to meet crop demand. This simplifies SWC irrigation operations because it minimizes the need for active water management, and in the absence of a delivery call (or a year in which the Director predicts an adequate water supply), the Cities have no objection to this type of operation.

efficient; this is one of several areas of inquiry that the Cities were not able to pursue due to the inadequate time for discovery in this matter. *See* Testimony of Greg Sullivan; *see also* Exhibit 347A at 3, 12.

However, in years in which the Director predicts a shortage and orders curtailment, the Department should not calculate SWC members' RISD by dividing CWN by average historical project efficiencies. This approach effectively locks in historical diversions as the measure of RISD and relies on what is, at best, circular logic: CWN/historical diversions are used to compute E_p and CWN/E_p is used to compute diversion demand (or RISD). As Dr. Brockway testified, "diversions are a given," without any consideration for whether the diversions are reasonable, efficient, and not wasteful. *See* Vol IV Tr. at 51:1-15. Dr. Brockway testified that if TFCC reduced its system losses (e.g., operational spills) it could also reduce its diversions by a magnitude of 200,000 acre-feet to raise its average project efficiency from 0.35 to 0.42. *Id.* at 131:2-25. The notion that SWC member diversions are locked in stone and can never again be re-evaluated is absurd and counter to case law and the Conjunctive Management Rules ("CMR").

The flaws in the Department's approach to project efficiency are further reinforced by Figures 3-12 through 3-19, Exhibit 347A, and Mr. Sullivan's testimony on the same. Figures 3-12 through 3-19 show that project efficiencies vary with CWN. As a result, the Department's reliance on historical average monthly project efficiencies to calculate RISD (in Steps 6-9) results in overstated RISD amounts that are not supported by actual diversions.

As reflected in Exhibit 347A, and the testimony of Mr. Sullivan at the hearing, the Cities suggest the Department jettison the efficiency values in paragraph 32 and rely on project efficiencies that reflect reasonably efficient operations consistent with industry standards. Short of that, the Cities suggest the following refinements to project efficiencies to reasonably reflect the historical relationships between CWN and E_p and ensure that the E_p generally reflect above average efficiencies that the SWC members have demonstrated they routinely achieve.

The Cities suggest that the Department derive project efficiency values depending on the R^2 relationship between E_p and CWN[6]:

- When the R^2 relationship between E_p and CWN is greater than 0.50, use the regression equations found in Figures 3-13 through 3-19 for the months from April-September (but no lower than the historical average monthly efficiencies);
- When the R^2 relationship between E_p and CWN is less than 0.50, use the 75th percentile of efficiency as shown in the graphs.

III. The Department Must Revert to Steady-State Modeling Because the Curtailment of Water Rights via Transient Modeling is not Justified and is Contrary to Law.

In the *Order*, the Department, for the first time, decided to switch from using steady-state modeling to using transient modeling to determine the priority date of water rights that must be curtailed to produce the demand shortfall. The timing of the change is curious, and is not due to ESPAM improvements: Jennifer Sukow and Dave Colvin both testified that the Department has had transient modeling at its disposal since the model's inception and that refinements made in 2013 allow for a finer time-step. Without any basis, the Department's mantra has been that curtailment based on transient modeling is required to ensure the seniors are provided with water "at the time and place required," apparently based on the standards for a *mitigation plan* under CMR 43. There is no appellate or statutory law that authorizes the Department to view curtailment in the same manner as a request by a junior for a mitigation plan.

Furthermore, curtailment based on transient modeling is inconsistent with Idaho law because of the vast disparity between acres curtailed to water that shows up in the stream. The Idaho Supreme Court has stated "the policy of securing the maximum use and benefit, and least

[6] For convenience, **Exhibit A** (attached) illustrates the monthly project efficiencies (or the equations to calculate project efficiencies) for each SWC member if the Department adopted the Cities' suggested method.

wasteful use of Idaho's water resources, has long been the policy in Idaho." *Rangen, Inc. v. Idaho Dep't of Water Res.*, 160 Idaho 119, 131 (2016) (citing *Clear Springs Foods, Inc. v. Spackman*, 150 Idaho 790, 808 (2011)). The Court acknowledged that this policy "limits the prior appropriation doctrine by excluding from its purview water that is not being put to beneficial use." *Id*. (citing *AFRD#2*, 143 Idaho at 876). The Court further tied the policy of maximum use to an acceptable "limit on the prior appropriation doctrine," found in CMR 20.03, that "[a]n appropriator is not entitled to command the entirety of large volumes of water in a surface or ground water source to support his appropriation contrary to the public policy of reasonable use of water." *Id.* (quoting IDAPA 37.03.11.020.03 (CMR 20.03)). The Court has held that the Director has broad discretion in implementing the CMR, which honor the state policy of reasonable use of both surface and ground water. *See id.* at 130.

> The policy of reasonable use includes the concepts of priority in time and superiority in right being subject to conditions of reasonable use as the legislature may by law prescribe as provided in Article XV, Section 5, Idaho Constitution, optimum development of water resources in the public interest prescribed in Article XV, Section 7, Idaho Constitution, and full economic development as defined by Idaho law. . . .

Rangen, 160 Idaho at 131 (quoting CMR 20.03).

In the conjunctive administration of groundwater and surface water, the Court has recognized that "not all of the water collected due to the curtailment will accrue to the senior water right holder; some will remain in the aquifer and some will flow to other tributary springs." *Id.* at 132. Accordingly, the Court said:

> This complexity can make it very difficult to balance a senior right holder's interest in receiving additional water against the State's interest in securing the maximum use and benefit, and least wasteful use, of its water resources. In light of this challenging balancing requirement, *it is necessary that the Director have some discretion to determine in a delivery call proceeding whether there is a point where curtailment is unjustified because vast amounts of land would be curtailed to produce a very small amount of water to the caller*.

Id. at 132 (emphasis added). Idaho law therefore authorizes the Director to rely on CMR 20.03 and Article XV, section 7, of the Idaho Constitution as a basis to limit curtailment. In *Rangen*, this policy authorized the Director to impose a trim line. *Id.* at 134. Here, the policy authorizes, if not requires, the Department to determine the priority date of water rights that must be curtailed by using steady-state modeling because curtailment under transient modeling unjustifiably increases the amount of curtailed acres tenfold and moves the priority date more senior by roughly 30-35 years. *See* Ex. 318 at 13.

Setting aside whether facts or conditions warrant the Department's switch in its modeling approach *this year*, the use of transient modeling in this delivery call in general offends the principles set forth in Idaho Code § 42-101, and the rationale and principles set forth by the Idaho Supreme Court in *Rangen* and *Clear Springs Foods*, because:

1) The disparity between the number of acres curtailed using transient modeling in 2023 (roughly 700,000), *see* Ex. 322 at 13, the amount of water that junior groundwater users would be precluded from diverting (estimated to be between 1.75 million acre-feet ("maf") and 2.0 maf) due to the curtailment, and the amount of water that would accrue to TFCC this year (75,200 acre-feet ("af")), renders curtailment past the "point where [it] is unjustified," *Rangen*, 160 Idaho at 132;
2) As discussed in the testimony of Greg Sullivan, Jennifer Sukow, and Dave Colvin, it is the past and present pumping by groundwater rights junior to approximately 1987 that has caused Snake River flows to decline by 75,200 af this year, so, consistent with the prior appropriation doctrine, only those junior right holders who are causing the shortage should face curtailment, *see* Ex. 347A at 25-26;

3) The maximum amount of water that curtailment using transient modeling could *ever* accrue to the near Blackfoot to Minidoka reach of the Snake River in the first year of curtailment is 97,700 AF, *see* Ex. 322 at 15. To achieve 97,700 AF of water, *all* ground water rights would need to be curtailed. In a dry year such as 2022, where there was a predicted shortage of 162,000 AF, transient modeling would be ineffective at fully reducing shortages calculated to SWC members. This further illustrates the limitations of curtailment and transient modeling as effective elements in administration of the SWC delivery call.

The Department's use of transient modeling disregards its duty to balance the State's interests in securing the maximum use and benefit of its water resources against the interests of the senior users; instead, it shifts conjunctive administration to a shut-and-fasten strict priority system that defies the Department's statutory mandate to "equally guard all the various interests involved" to the use of water. Idaho Code § 42-101.

Further, curtailment under transient modeling could result in certain water users being curtailed, or being forced to supply mitigation water, when those users are not injuring the SWC's members whatsoever. In *Rangen*, the SWC "argue[d] that the prior appropriation doctrine requires administration of all rights contributing to the material injury . . . ." 160 Idaho at 130. Here, testimony from Jennifer Sukow, Dave Colvin, and Greg Sullivan demonstrates that using steady-state modeling better reflect reality in the ESPA, as the aquifer has reached a state of quasi-equilibrium and it is those groundwater users with priority dates junior to the mid-1980s that are causing the SWC's shortfall in 2023. *See, e.g.*, Ex. 347A at 25-26. It is inequitable, if not unconstitutional, to redress an injury by penalizing water users who did not cause the injury.

Accordingly, the Department must not curtail water users who are not actually contributing to the SWC's demand shortfall.

Finally, the Department should revert to using steady-state modeling because use of the transient model would not adequately redress the SWC's material injury—the maximum amount of water that could accrue to TFCC in 2023 through curtailment is 97,700 af. *See* Ex. 318 at 13, 15. Had 2023 been a dry year, the demand shortfall could have far exceeded this amount, meaning that curtailment of *all* pumping on the ESPA would still not be enough. Curtailing so much pumping would be unjustified and contrary to Idaho law. This validates the testimony of Greg Sullivan, who opined that curtailment of groundwater users (in lieu of requiring these users to supply mitigation water) is an inferior and inefficient way to conjunctively administer surface and groundwater rights.

In sum, the Department must revise the *Order* to reinstate the use of steady-state modeling to determine "a priority date for curtailment if mitigation obligations are not satisfied." If not, curtailment using transient modeling will be unjustified (based on the disparity between acres curtailed and water accrued), and will unduly prejudice users who did not cause the SWC's injury.

Respectfully submitted this 16th day of June, 2023.

STATE OF IDAHO

DEPARTMENT OF WATER RESOURCES

IN THE MATTER OF THE DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY AND FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **IGWA's Post-Hearing Brief**

Idaho Ground Water Appropriators, Inc., ("IGWA"), acting for and on behalf of North Snake Ground Water District, Magic Valley Ground Water District, Carey Valley Ground Water District, American Falls-Aberdeen Ground Water District, Jefferson-Clark Ground Water District, Madison Ground Water District, and Henry's Fork Ground Water District, submits this post-hearing brief pursuant to verbal instructions given by the Director at the conclusion of the hearing held June 6-9, 2022.

INTRODUCTION

Anytime the Department undertakes a review of the Methodology Order, the objective must be to improve its accuracy as a tool to administer surface and ground water resources in accordance with the Conjunctive Management Rules ("CM Rules"). In applying the CM Rules, the Idaho Supreme Court has instructed the Department to use the "best science available." *Clear Springs Foods, Inc. v. Spackman*, 150 Idaho 790, 813 (2011). Consequently, the Department has a duty to periodically review the Methodology Order, evaluate its performance, and make changes as appropriate to more accurately manage surface water and groundwater resources under the SWC delivery call in accordance with the CM Rules using the best science available.

The CM Rules were developed to bridge Idaho's different statutory schemes for managing surface water and groundwater. The prior appropriation doctrine applies in both contexts, but it applies differently due to their different hydrologic environments. River flows fluctuate considerably throughout each irrigation season and reset each winter from snowfall. By contrast, changes in aquifer levels occur slowly over multi-year periods. Surface water can be shepherded among water users through rivers, canals, and ditches in a matter of hours or days, whereas groundwater cannot. When a groundwater well is shut off, the effect emanates in all directions, it may take months or years for a senior-priority water user to realize additional water, and the senior may not need additional water when it finally arrives.

Given their different hydrologic properties, the Idaho Legislature adopted different schemes for applying the prior appropriation doctrine to surface water and groundwater. Surface water is distributed under Idaho Code § 42-607 by opening and closing headgates to shepherd the available supply to those entitled to receive it on any given day of the year. By contrast, aquifers are managed under the Ground Water Act based on "reasonable ground water pumping levels" designed to maximize beneficial use of the resources by allowing groundwater users to fully develop the resource so long as they do not overdraft the aquifer. Idaho Code § 42-226. If holders of groundwater rights overdraft the aquifer, priority determines which water rights must be curtailed to maintain a reasonable groundwater pumping level. *Clear Springs Foods, Inc. v. Spackman*, 150 Idaho 790, 802, 252 P.3d 71, 83 (2011) ("…with respect to ground water pumping, the prior appropriation doctrine was modified so that it only protects senior ground water appropriators in the maintenance of reasonable pumping levels in order to obtain full economic development of ground water resources.")

The CM Rules aim to bridge these different schemes. Under conjunctive management, delivery calls by senior surface water users are not controlled by the "reasonable pumping level" construct of the Ground Water Act, but nor are they entitled to curtail beneficial use of far more water than the senior needs, as stated in CM Rule 20.03: "An appropriator is not entitled to command the entirety of large volumes of water in a surface or ground water source to support his appropriation contrary to the public policy of reasonable use of water as described in this rule." The Idaho Supreme Court has affirmed the balancing act required by the CM Rules: "Somewhere between the absolute right to use a decreed water right and an obligation not to waste it and to protect the public's interest in this valuable commodity, lies an area for the exercise of discretion by the Director." *American Falls Reservoir Dist. No. 2 v. Idaho Dept. of Water Resources*, 143 Idaho 862, 880 (2007) ("*AFRD2*").

What makes conjunctive management so problematic is the large amount of beneficial use of groundwater that must be curtailed to supply a relatively small amount of additional surface water to senior users. The prior appropriation doctrine was adopted not only because it protects the interests of prior appropriators, but also because it facilitates full development of the state's water resources. Misapplied conjunctive management can have the opposite effect by minimizing beneficial use of Idaho's water resources.

Courts have historically curbed the exercise of priority in circumstances where it would significantly impede full development of the state's water resources. In *Schodde v. Twin Falls Land & Water Co.*, 224 U.S. 107 (1917), a senior-priority water user was deprived of his ability to divert water from the Snake River because it would have prevented development of the Twin Falls Canal and the North Side Canal systems under junior-priority water rights. The court denied the senior's claim, holding that his appropriation "lacks one of the essential attributes of an appropriation—it is not reasonable." *Id*. at 118. The court explained:

> In this arid country, where the largest duty and the greatest use must be had from every inch of water, in the interest of agriculture and home building, it will not do to say that a stream may be dammed so as to cause subirrigation of a few acres, at a loss of enough water to surface irrigate ten times as much by proper application.

Id. at 124-25. The doctrine of reasonable use is grounded in a long series of Idaho Supreme Court decisions. For instance, in *Poole v. Olaveson*, 82 Idaho 496, 502 (1960), the court held: "The policy of the law of this State is to secure the maximum use and benefit, and least wasteful use, of its water resources." Similarly, in *Farmer's Cooperative Ditch Co. v. Riverside Irrigation Distr.*, 16 Idaho 525, 525-36 (1909), the court held:

> Economy must be required and demanded in the use and application of water. Water users should not be allowed an excessive quantity of water to compensate for and counterbalance their neglect or indolence in the preparation of their lands for the successful and economical application of the water. One farmer although he has a superior water right, should not be allowed to waste enough water in the irrigation of his land to supply both him and his neighbor simply because his land is not adequately prepared for the economical application of the water.

In keeping with the doctrine of reasonable use, the CM Rules do not allow seniors to simply call for their full decreed water right and then sit back while the Department curtails juniors. Rather, a conjunctive management call triggers analyses of how much water the senior reasonably needs to accomplish their beneficial use, whether the senior is using water efficiently, and reasonable use of the resource, among other things. In reviewing the Methodology Order, the Director must evaluate its performance against the objectives of the CM Rules and make changes using the best science available that will cause it to more accurately and effectively implement the CM Rules.

The last evidentiary hearing involving the Methodology Order occurred in 2008. The recent hearing reflects 15 years of experience along with new and better science and data. Some of the information presented at the hearing warrants immediate changes to the *Fifth Methodology Order*. Other information deserves further analysis by a technical working group charged with recommending improvements to be incorporated into the methodology at a future date. It is imperative that identified weaknesses in the methodology not go unaddressed simply because an improved process and better science is not ripe for immediate implementation.

LEGAL STANDARD

Implicit in the directive to use the best science available is an obligation to use the best data available. Yet, in some instances the *Fifth Methodology Order* does not use the best science or the best data due to a misperception by Department staff that it does not satisfy a clear and convincing standard of proof. In light of this, a review of applicable legal standards and burdens of proof is appropriate.

First, the Department has a statutory duty to equally guard the interests of both senior and junior water users when administering the State's water resources, as stated in the introductory sentence of Idaho's water code:

> Water being essential to the industrial prosperity of the state, and all agricultural development throughout the greater portion of the state depending upon its just

> apportionment to, and economical use by, those making a beneficial application of the same, its control shall be in the state, which, in providing for its use, shall equally guard all the various interests involved. (Idaho Code § 42-101)

Second, the two bedrock components of the prior appropriation doctrine—priority and beneficial use—are co-equal. *In Matter of Distribution of Water to Various Water Rights Held By or For Ben. of A & B Irrigation Dist., at al.*, 155 Idaho 640, 650 (2013) ("The prior appropriation doctrine is comprised of two bedrock principles—that the first appropriator in time is the first in right and that water must be placed to a beneficial use"). Neither is superior to the other. There is no "clear and convincing" standard of proof favoring one over the other. The Department must give equal weight to both when administering the State's water resources.

Third, senior water users generally have a right to exercise priority and curtail junior water users, but "this is not an absolute rule without exception." *AFRD2*, 143 Idaho at 880. Seniors can only call for as much water as they need to accomplish their beneficial use when using water efficiently and without waste. *A&B Irr. Dist. v. IDWR*, 153 Idaho 500, 524 (2012). A determination that the senior needs less than their full decreed rate of diversion requires clear and convincing evidence. 155 Idaho at 655.

Fourth, priority cannot be exercised in a manner that is unreasonable. The waters of Idaho are a state-owned resource, and the people of Idaho have an interest in seeing the state's water put to maximum beneficial use, as discussed above. The prior appropriation doctrine was adopted not only because it protects the interests of prior appropriators, but also because it facilitates the public's interest in achieving maximum utilization of the state's water resources. The doctrine of reasonable use guards this interest.

SUMMARY

Based on the evidence presented at the hearing, IGWA contends that the following changes to the *Fifth Methodology Order* should be implemented immediately:

- Use the best science available to determine actual irrigated acreage of SWC entities.
- Use the best science available to determine and account for supplemental groundwater use of SWC entities.
- Require SWC entities to annually submit an accurate GIS shapefile or other trustworthy analysis of actual irrigated acreage and supplemental groundwater use.
- Adjust the Baseline Year (BLY) to more accurately represent water demands of SWC entities without excessive material injury calculations.
- Apply the futile call doctrine to exclude from curtailment those groundwater rights for whom curtailment will provide no additional water to the SWC by the Time of Need.
- Implement a trim line to prevent an unreasonable exercise of priority.

In addition, the Director should reconvene a technical working group comprised of both Department staff and consultants for the parties, charged with further analyzing data and making recommendations to improve the methodology, including the following:

- Improve the end-of-season injury calculation to more accurately reflect actual injury.
- Develop a mechanism and process for Department staff and third party consultants to annually review the irrigated acreage and supplemental groundwater use information submitted by SWC entities.
- Develop a mechanism to account for project efficiencies based on real efficiency factors.
- Develop a mechanism to adjust the Forecast Supply (FS) formula to account for water accruing to the SWC from major tributaries to the Snake River below Heise, including the Henry's Fork, Willow Creek, Blackfoot River, Portneuf River, and Raft River basins.
- Develop an improved method of predicting FS for Twin Falls Canal Company.

ANALYSIS

Since the fundamental purpose of the Methodology Order is to calculate material injury, the principal goal of reviewing the Methodology Order must be to improve its accuracy in that regard. Any changes to the methodology should cause it to do a better job of calculating injury.

Evaluating the accuracy of the Methodology Order naturally requires a comparison of calculated injury with actual injury. Just because the Methodology Order calculates injury does not mean injury actually occurs, and vice versa.

Since Twin Falls Canal Company (TFCC) is usually the only SWC entity for which the Methodology Order predicts injury, TFCC must be the focal point of a comparison of calculated versus actual injury. As explained below, the *Fifth Methodology Order* significantly over-calculates injury for TFCC, in part due to errors and inaccuracies in the data used in the Methodology Order that can easily be remedied.

The *Fifth Methodology Order* should be revised to more accurately calculate injury. In addition, the change from a steady-state to a transient-state application of the ESPA Model (ESPAM) necessitates application of the futile call doctrine and the doctrine of reasonable use to protect the public interest in beneficial use of the ESPA in accordance with the CM Rules.

1. The *Fifth Methodology Order* should be revised to more accurately calculate injury.

As long as TFCC shareholders have enough water to grow the crops they desire to grow, they do not experience material injury. Undisputed evidence shows that TFCC has a very reliable supply of water, and that TFCC almost always delivers to its shareholders at least 5/8 inch per acre, which is enough to grow all crops customarily raised on the TFCC tract. Only in the most severe drought years is TFCC unable to deliver 5/8 inch.

By contrast, the *Fifth Methodology Order* calculates injury to TFCC almost every year. The injury calculations are so extreme that they bear little resemblance to reality. Therefore, revisions should be made to the *Fifth Methodology Order* to so that calculated injury more accurately reflects actual injury.

1.1 TFCC's annual water diversions have remained remarkably steady over the last half-century.

While the diversion of groundwater from the ESPA has contributed to declining reach gains to the Near Blackfoot to Neeley reach, diversions by TFCC have remained remarkably steady over the last half-century, as evident by TFCC's own diversion records. (Ex. 4, p. 7, Fig. 4.) Since 2010, TFCC diversions have actually trended upward. This demonstrates that declining reach gains have not generally diminished the water supply available to TFCC. This is because TFCC holds the most senior natural flow water right among all SWC entities. Declining reach gains have impacted the natural flow supplies of junior-priority SWC entities like Burley Irrigation District (BID) and Milner Irrigation District (MID) much more than TFCC; however, BID and MID hold large amounts of storage which has allowed them to absorb declining reach gains without experiencing material injury.

1.2 TFCC's longtime consultant and expert witness confirmed that TFCC has a reliable water supply.

TFCC's longtime consultant Dr. Charles Brockway, Jr. testified that TFCC is well known as having a reliable supply of water, owing to its most senior natural flow rights supplemented by storage water. As evidence of this, Dr. Brockway explained that there are relatively few supplemental groundwater wells within TFCC. If TFCC's water supply were unreliable, Dr. Brockway testified there would be many more supplemental groundwater wells.

1.3 TFCC shareholders can raise crops with 5/8 inch per acre without suffering material injury.

TFCC delivers water to shareholders on a per share basis, measured in miner's inches. The TFCC system was designed for one share per acre, but there are currently 10,000-20,000 more shares than irrigated acres, resulting in an average of around 1.1 shares per acre. The peak rate TFCC can deliver is 3/4 inch per share, but TFCC's base delivery is 5/8 inch per share. During severe drought TFCC has on occasion delivered 1/2 inch per share. (Ex. 332).

To be sure, it is easier to manage a canal with peak diversions. Peak diversions require little operational efficiency, whereas managing water more efficiently requires more care and attention. Consequently, TFCC, like all other canal companies, diverts its maximum authorized diversion rate when water is plentiful, even if its shareholders could grow their crops with less water when used efficiently. (Barlogi.)

When making a conjunctive management delivery call, however, senior users are not entitled to curtail juniors simply to enjoy the convenience of peak flows and easy operational management. Given the large amount of beneficial use of groundwater that must be curtailed to provide a comparatively small amount of additional to a senior surface user, the CM Rules require seniors use water efficiently before looking to curtail juniors. CM Rule 40.03 provides:

> In determining whether diversion and use of water under rights will be regulated under Rule Subsection 040.01.a. or 040.01.b., the Director shall consider whether the petitioner making the delivery call is suffering material injury to a senior-priority water right and is diverting and using water efficiently and without waste, and in a manner consistent with the goal of reasonable use of surface and ground waters as described in Rule 42.

As explained below, the amount of water TFCC needs to raise crops without suffering material injury has not heretofore been determined. However, the record is clear and unequivocal that TFCC shareholders can raise crops on 5/8 inch per acre without suffering material injury.

(a) The amount of water TFCC needs to raise crops without suffering material injury has not been determined.

The Department's original material injury analysis considered, among other things, "average monthly headgate deliveries to the entity's members or shareholders (e.g., 5/8 inch)." *Order*, p. 31 (Feb. 14, 2005). Consequently, the original evidentiary hearing held in 2008 included evidence of the amount of water TFCC stockholders need to raise crops without suffering material injury. After considering the evidence, the hearing officer, former Idaho Supreme Court Justice Gerald Schroeder, made the following finding of fact:

> The former Director accepted Twin Falls Canal Company's response that 3/4 inch constituted full headgate delivery, and TFCC continued to assert that position at hearing. This is contradicted by the internal memoranda and information given to the shareholders in the irrigation district. It is contrary to a prior judicial determination. It is inconsistent with some of the structural facilities and exceeds similar SWC members with no defined reason. Any conclusions based on full headgate delivery should utilize 5/8 inch.

Opinion Constituting Findings of Fact, Conclusions of Law and Recommendation, p. 53, 55. (April 29, 2008). On September 5, 2008, the Director issued the *Final Order Regarding the Surface Water Coalition Delivery Call* accepting the hearing officer's recommendation.

On appeal, the district court ruled that "senior right holders are authorized to divert and store up to the full decreed or licensed quantities of their storage rights, but in times of shortage juniors will only be regulated or required to provide mitigation subject to the material injury factors set forth in CMR 042." *Order on Pet. For Jud. Rev.*, Gooding Cty. Case No. CV-2008-551, p. 26 (July 24, 2009). However, the court determined that the Director's finding that a "full headgate delivery" is 5/8 inch per acre exceeded his authority because TFCC's authorized diversion rate was to be decided in the SRBA. *Id*. at 31-32. On rehearing, the court clarified that while the SRBA court determines that maximum authorized rate of diversion under TFCC's water rights, the Department may determine under the CM Rules that TFCC needs less than its maximum rate to accomplish its beneficial use, but that such a determination must be supported by clear and convincing evidence. *Order on Pet. For Rehearing*, Gooding Cty. Case No. CV-2008-551, p. 7-8 (Aug. 23, 2010). Since the hearing officer did not indicate the evidentiary standard he applied to arrive at his 5/8 inch full headgate delivery finding, the district court remanded the matter to the Department to make that determination. *Id*.

The court's decision concerning the clear and convincing standard relied on a separate district court decision issued earlier that year in the A&B Irrigation District delivery call case. There, the court ruled that the decreed rate of diversion reflects a determination of beneficial use at the time of adjudication, but "there may be post-adjudication factors relevant to the determination of how much water is actually needed." *Memorandum Decision and Order on Pet. For Jud. Rev.*, Minidoka Case No. 2009-647, p. 30 (May 4, 2010). The court explained:

> The most obvious example would be if the senior is not irrigating the full number of acres for which the right was decreed. Efficiencies, new technologies and

> improvements in delivery systems that reduce conveyance losses can result in a circumstance where the full decreed quantity may not be required to irrigate the total number of decreed acres. The subsequent lining or piping of a ditch or the conversion from gravity fed furrow irrigation to sprinkler irrigation can reduce the quantity of water needed to accomplish the purpose of use for which the right was decreed. Year to year variations in water requirements also result from the types of crops that may be planted. The Idaho Legislature specifically acknowledged water users could reduce water requirements through the implementation of efficiencies and authorized the ability to expand irrigated acreage so long as the rate of diversion was not increased. See I.C. § 42-1426.

Id. at 30-31. The court noted also that "the rate of diversion for an irrigation water right sets a maximum rate of diversion to satisfy the peak water demand for the most water intensive crop grown in the region. In the event the senior is irrigating a less water intensive crop, the maximum rate of diversion may not be required." *Id*. at 30, fn. 11. The court then quoted a decision issued by the SRBA court stating:

> the quantity element of a water right necessarily sets the 'peak' limit on the rate of diversion that a water right holder may use at any given point in time … whereas the beneficial use limit is a fluctuating limit, which contemplates both rate of diversion and total volume, and takes into account a variety of factors, such as climatic conditions, the crop which is being grown at the time, the stage of the crop at any given point in time, and the present moisture content of the soil, etc.

Id. at 32.

Returning to the SWC case, after the district court issued its rehearing decision in August of 2010 remanding the 5/8 versus 3/4 inch issue, IDWR filed a motion for reconsideration stating: "As established in the Methodology Order, the Director is using 3/4 of an inch for TFCC diversions, instead of the stated 5/8 of an inch in his September 5, 2008 Final Order;" therefore, "the basis for the remand is moot." *Motion to Clarify / Motion for Reconsideration of Orders on Petitions for Rehearing*, Gooding County Case No. CV-2008-551, p. 3 (Aug. 26, 2010). Around that time, the Department had changed how it calculated material injury, switching from the "Minimum Full Supply" methodology to the "Reasonable In-Season Demand" methodology. The district court accepted the Department's representation. *Amended Order on Petitions for Rehearing; Order Denying Surface Water Coalition's Motion for Clarification*, Gooding County Case No. CV-2008-551, p. 10 (Sep. 10, 2010). Accordingly, the Idaho Supreme Court did not address the issue on appeal, though it noted it in the procedural history. *In Matter of Distr. of Water to Various Water Rts. Held By or For Ben. of A & B Irr. Dist.*, 155 Idaho at 647 (2013).

The Methodology Order does not actually utilize a 3/4 inch headgate delivery, 5/8 inch delivery, or any other headgate delivery as part of its material injury determination for TFCC. Rather, it predicts material injury using a "Baseline Year" mechanism which is based on each SWC entity's gross diversion volume in a year or average of years with below-average precipitation, above-average ET, and unlimited water supply.

Since material injury under the Baseline Year mechanism is not tied to headgate deliveries, the parties ceased litigating whether TFCC shareholders can raise their crops with 5/8 inch per acre without suffering material injury. However, the parties foresaw that the issue would be

relevant in the future. Therefore, when TFCC's water rights were adjudicated in the SRBA, TFCC, IGWA, and Pocatello signed a stipulation in April of 2012 stating:

> a. Evidence relating to water use after November 19, 1987 was not at issue in the Adjudication. These water rights are decreed in the Snake River Basin Adjudication based on the extent of beneficial use that existed prior to or at the time of commencement of the Adjudication on November 19, 1987. The parties agree that issues related to conjunctive administration (including factors identified in IDAPA 37.03.11.42), as they exist after November 19, 1987, were not at issue in these subcases.
>
> b. The "diversion rate" element under each water right reflects the maximum authorized rate of diversion under each water right. However, the parties agree that crop water demand can vary over the course of an irrigation season, or from season to season, meaning the maximum authorized diversion rate may or may not be required over the entire course of a particular irrigation season.

Ex. 184, p. 2.[1]

IGWA is not presently raising the 5/8 inch headgate delivery as a means of changing or replacing the Baseline Year mechanism currently used in the Methodology Order to predict material injury. Rather, IGWA is raising it for the purpose of comparing how well the Methodology Order's material injury calculations correlates with actual injury. The Idaho Supreme Court has made clear that "evaluating whether a diversion is reasonable in the administrative context should not be deemed a re-adjudication." *AFRD2*, 143 Idaho at 878 (citing *Schodde*, 244 U.S. 107 (1912)).

(b) Clear and convincing evidence demonstrates that TFCC shareholders can raise crops on 5/8 inch per acre without suffering material injury.

The evidence is unequivocal that TFCC shareholders can fully irrigate their crops with 5/8 inch per acre without suffering material injury.

First, TFCC's shares of stock were issued on the basis that they provide a delivery rate of 5/8 inch per acre. When TFCC undertook to construct its canal system, it entered into a contract with the State Board of Land Commissioners stating that each share of stock provides a right to the delivery of 5/8 inch per acre when supplies permit: "The certificates of sale of water rights and the certificates of shares of stock of the Twin Falls Canal Company, Limited, shall each upon being issued to the purchaser or holder of land under the canal system, be made to indicate and define in the contract or certificate as the case may be, the amount of water, to-wit: One eightieth of a second foot allotted to each acre represented thereby." (Ex. 363, p. 7; Ex. 364)

Second, TFCC's internal policy documents clearly establish that 3/4 inch is the maximum capacity of the system and that 5/8 inch is the normal headgate delivery. TFCC's 1999 Management Plan states that "TFCC has always operated on the premise that the Company must deliver 5/8 m-in per acre constant flow so long as that supply is available." (Ex. 4166, p. 2.)[2]

---

1 An SRBA Standard Form 5 (Stipulated Elements of a Water Right) incorporating this stipulation was filed with the SRBA Court on May 23, 2012, in Subcase Nos. 1-4, 1-10 and 1-209.

2 Ex. 4166 citation is found as a part of the final agency record on appeal in Gooding County Case No. CV-2008-551.

Likewise, TFCC's Operations Policy states: "The TFCC water right is 5/8ths of an inch per share. This includes an obligation to deliver 1/80th of a cubic foot per second for each share of stock when water is available." (Ex. 339, p. 2.); *State v. Twin Falls Canal Co*., 21 Idaho 410 (1911); *Twin Falls Land & Water C. v. Twin Falls Canal Co*., 79 F.2d 431 (9th Cir. 1935).

Third, TFCC leases storage to the Bureau of Reclamation for flow augmentation purposes on years when it delivers 5/8 inch per share. If TFCC shareholders suffer genuine injury with a 5/8 inch delivery, TFCC would not voluntarily lease storage to a third party.

Fourth, 5/8 inch per acre is ample to raise all crops grown by TFCC shareholders. TFCC's manager testified that shareholders typically take water continuously throughout the irrigation season beginning in April and ending in late September or October. Conservatively assuming a 5-month irrigation season and a delivery rate of 5/8 inch per acre, TFCC delivers 4.7 acre-feet per acre to the headgate of each shareholder. By comparison, the following table shows the volume of water needed to grow each crop customarily grown by TFCC shareholders, based on precipitation deficit data developed by the University of Idaho for the Twin Falls area.

Twin Falls 3SE (NWS – USC00109299)		
Precipitation Deficit Data		
Crop	Annual ET (a-f)	Growing Season ET (a-f)
Alfalfa - peak (no cutting effects)	3.8	3.84
Alfalfa - frequent cuttings	3.01	3.05
Sugar Beets	2.53	2.59
Field Corn - moderate season length	2.02	2.07
Silage Corn - truncated season	1.94	2
Sweet Corn - early plant	1.62	1.66
Sweet Corn - late plant	1.62	1.65
Potatoes - early harvest	1.55	1.6
Potatoes - late harvest	1.85	1.9
Grass Hay	2.97	3.07
Spring Grain - irrigated	1.8	1.93
Winter Grain - irrigated	1.99	1.92
Grass Pasture - high management	2.91	3.01
Grass Pasture - low management	2.32	2.41

All of this clearly demonstrates that TFCC shareholders can raise their crops on 5/8 inch without suffering material injury. The SWC offered no contradictory evidence.

1.4 The Methodology Order frequently calculates injury in years when TFCC delivers 5/8 inch or more per acre.

TFCC produced a chart showing the amount of water it has delivered to the headgates of its shareholders since 1990, showing at least 5/8 inch delivery throughout the entire irrigation season in all but five of the last 32 years. (Ex. 332.) By contrast, the Methodology Order frequently calculates material injury at the end of the irrigation during yeas when TFCC delivers

5/8 inch and even 3/4 inch per share for the duration of the irrigation season, as shown in the "November Actual Demand Shortfall" column of the following table which is a combination of the tables contained in Exhibit 837A at Attachment C and page 6 (Table 2-8):

Year	April BLY 06-08-12 (AF)	April BLY 2018 (AF)	July BLY 06-08-12 (AF)	July BLY 2018 (AF)	November Actual Demand Shortfall (AF)	TFFC inches per acre	Year
2000	30,183	126,125	0	0	0	3/4	2000
2001	179,947	334,970	160,472	200,546	243,565	*3/4, 5/8, 1/2*	*2001*
2002	42,800	131,308	17,381	45,136	31,217	5/8	2002
2003	10,124	93,902	43,808	80,241	0	5/8	2003
2004	199,101	364,958	223,032	264,426	264,340	*5/8, 1/2*	*2004*
2005	114,916	228,241	0	0	0	5/8	2005
2006	0	0	365,880	388,939	23,792	3/4	2006
2007	56,914	152,855	201,036	253,185	289,065	5/8	2007
2008	0	15,138	46,525	55,334	0	3/4	2008
2009	0	34,109	0	0	0	3/4	2009
2010	94,957	190,898	0	0	0	3/4	2010
2011	0	0	0	0	0	3/4	2011
2012	0	53,778	69,066	92,125	139,524	3/4, 5/8	2012
2013	28,802	110,912	114,058	154,132	22,588	3/4, 5/8	2013
2014	0	0	0	0	0	3/4, 5/8	2014
2015	88,959	184,901	107,418	138,684	92,246	3/4	2015
2016	44,163	111,457	21,271	44,330	7,853	3/4	2016
2017	0	65,382	0	0	0	3/4	2017
2018	0	44,805	0	0	10,996	3/4	2018
2019	20,943	88,237	0	0	0	3/4	2019
2020	0	59,101	0	0	0	3/4	2020
2021	40,491	126,102	162,873	194,139	190,816	*3/4, 5/8, 1/2*	*2021*
2022	162,613	313,446	52,771	84,036	276,551	*5/8, 1/2*	*2022*

No adjustments are made in the *Fifth Methodology Order* to improve the accuracy of the end-of-season material injury calculation. Evidence presented at the hearing shows the overcalculation is due in part to errors or inaccuracies in the data in the data used in the Methodology Order, as discussed below. Some of these errors can be corrected immediately to improve the accuracy the Methodology Order; others should be assigned to the technical working group for further analysis.

1.5 The *Fifth Methodology Order* generates extreme pre-season and mid-season injury predictions that bear little resemblance to reality.

Whereas the end-of-season calculation is intended to reflect actual injury, the Methodology Order intentionally overpredicts Demand Shortfall (DS) in April (Step 3) and July (Step 6) by using above-average water demand for the Baseline Year (BLY) and below-average water supply as the Forecast Supply (FS). These biases compound to aggressively over-predict DS. The *Fifth Methodology Order* takes the overprediction to new heights by adopting a new BLY that is much more aggressive than the BLY used in prior iterations of the Methodology Order.

In addition, errors and inaccuracies in the data used in the methodology cause it to overpredict DS even further. The result is a *Fifth Methodology Order* that generates extreme overpredictions of DS that bear little resemblance to reality. As shown in the above table, a hindcast of the *Fifth Methodology Order* applying it to the time period 2000-2022 shows it generating DS predictions in April (Step 3) and July (Step 6) in 20 out of 22 years, even though

TFCC rarely suffers injury in reality. In most of those years, the curtailment would shut off water to every groundwater right from the ESPA—farmers, cities, food processors, and others.

The above table demonstrates that the *Fifth Methodology Order* is far out of balance with the objectives of the CM Rules. This is reinforced by the fact that it generated a massive curtailment in 2023 despite snowpack being far above average and a reservoir system expected to fill or nearly fill. Nobody familiar with water supplies in the Upper Snake River Basin believes there is any legitimate risk of injury to TFCC this year.

1.6 Evidence presented at the hearing identified several solutions that will improve the accuracy of the *Fifth Methodology Order*.

Fortunately, there are solutions. The Methodology Order can become more accurate at predicting material injury by (i) adjusting the BLY to correlate with hydrologic conditions represented previously by the BLY, (ii) adjusting the FS to account for inflows from other tributary basins, (iii) developing an improved regression model to forecast water supply for TFCC, (iv) using actual irrigated acreage to calculate material injury, (v) accounting for supplemental groundwater use, and (vi) developing a method of calculating project efficiency based on real efficiency factors.

(a) Baseline Year (BLY).

The *First Methodology Order* utilized 2006 and an average of 2006 and 2008 ("06/08") as a BLY. 2006 BLY represented 97% of the 2000-2008 total SWC diversions, and the 06/08 BLY represented 100% of the average 2000-2008 total SWC diversions. Both 2006 and the 06/08 average were determined by the Department to be an appropriate BLY. (Ex. 837A, p. 13.)

The *Third Methodology Order* updated the BLY based on data from 2009-2014 data, with the Department selecting average diversions in 2006, 2008 and 2012 as the BLY, resulting in a BLY equivalent to 101% of average diversions from 2000-2014. *Id*. The *Fifth Methodology Order* adopts a single year of diversions in 2018 as the BLY, pushing the BLY to 104% of average diversions from 2000-2021. For TFCC, diversions for 2018 are 106% of the average 2000-2021 diversions.

The difference between 101% and 104% or 106% BLY is far more consequential than one might expect, adding 96,000 acre-feet of predicted DS in April. (Ex. 837A, p. 18.) This is a significant reason why the *Fifth Methodology Order* has become far less accurate at predicting injury than the *Fourth Methodology Order*.

2018 is a poor representation of above-average water demand of the SWC because it falls on the extreme end of the spectrum for precipitation. For years from 1992-2021, 2018 was the only irrigation season where there was zero precipitation from July to September.

It is also significant that the Methodology Order creates a "positive feedback loop" that incentivizes SWC entities to divert as much water as possible in order to elevate their average diversion volumes, which in turn generates a higher BLY, which in turn requires junior water users to provide more mitigation to the SWC to avoid curtailment. (Sullivan.) Not surprisingly, TFCC diversions have trended upward in recent years, forcing the BLY upward. *Id.*

The 2018 BLY is not the only option. As shown in Table 2-4 of Exhibit 837A, a BLY of 06/18 is more consistent with the average 2000-2021 BLY selection criteria values than a BLY of 2018 or 2020. (Ex. 837A, p. 19.) This change to the Methodology Order can be implemented immediately and will improve its accuracy in predicting material injury.

(b) Forecast Supply (FS).

The Methodology Order predicts water supply to the SWC based on flows at Heise Gauge on the South Fork of the Snake River near Ririe, without accounting for inflows from other major tributary basins such as the Henry's Fork, Willow Creek, Blackfoot River, Portneuf River, and Raft River. As of April 3, 2023, snow water equivalent in the Willow Creek basin was 178% of normal, the Blackfoot basin was 186% of normal, Henry's Fork Bains at 124% of normal, and the Portneuf basin 216% of normal, whereas the Upper Snake Basin above Palisades was at 120%. (Ex. 366.) In years like 2023 when the unaccounted-for tributaries have much higher snowpack than the headwaters of the South Fork, the Methodology Order significantly underpredicts actual water flows available to the SWC, which results in an overprediction of DS.

The Director should instruct the technical working group to evaluate incorporation of other major tributaries in the FS formula in order to improve the accuracy of the Methodology Order's DS calculations.

The Director should also instruct the technical working group to take action to improve the regression model used to forecast water supply to TFCC. The current model has a degrading R^2 value, decreasing from 0.86 in 2014 to 0.72 in 2022. R^2 values are a standard statistical tool used to quantify the predictive power of a model. (Sigstedt; Anders.) R^2 values range between one (1) and negative one (-1), with numbers approaching either representing better model predictions. *Id.* The decreasing R^2 value in the TFCC model means that the predictive power of the TFCC FS model is getting worse over time. *Id.* Given the continued, persistent decrease in R^2 values on the TFCC model, it is unlikely to improve in future years. (Sigstedt.)

The TFCC model has been a concern since at least 2015 when Sophia Sigstedt provided recommendations to the Department for improving the methodology's natural flow models. (Ex. 837A, p. 77). At that time, Ms. Sigstedt presented an alternative forecast model approach that should be investigated. *Id.* Department staff have been concerned with the TFCC forecast for several years, but no action has been taken to explore Ms. Sigstedt's proposal or otherwise improve the regression model for TFCC.

The *Fifth Methodology Order* states: "The forecasting techniques will be revised based on updated data and the forecasting techniques may be revised when improvements to the forecasting tools occurs." (Ex. 300, p. 18). Accordingly, the Director should task the technical working group with developing a more accurate and reliable forecast supply model for TFCC.

(c) Irrigated Acreage.

TFCC's water rights authorize the irrigation of 196,162 acres. However, this reflects irrigation as of the commencement of the SRBA on November 19, 1987. TFCC admits that fewer acres are irrigated today. Thus, the clear and convincing standard has been met that TFCC is not irrigated its full decreed acreage.

At the first evidentiary hearing held in 2008, a manual review of the TFCC project revealed a total of 183,589 irrigated acres. (Ex. 3007A[3]; Ex. 837A, p. 8.) From 2010-2014, the Department calculated material injury for TFCC based on this figure. (Sigstedt; Ex. 837A, p. 8.) Since 2015, the Department has assumed 194,732 irrigated acres based on a GIS shapefile that TFCC generated in-house with no collaboration with IDWR or the groundwater users directly

[3] Ex. 3007A was admitted to the agency record in this matter during the original 2008 delivery call and is contained in the final agency record on appeal in Gooding County Case No. CV-2008-551.

affected by the issue. (Sigstedt). The TFCC shapefile has never been subject to scrutiny in an evidentiary hearing. At the recent hearing, it was made clear that the 2013 shapefile was created with a broad brush that captured all land that could theoretically be irrigated, including many homes, farmsteads, subdivisions and other lands that are not in fact irrigated. Thus, the 2013 TFCC shapefile captures a gross acreage figure that is far greater than actual irrigated acreage within TFCC.

IDWR maintains Irrigated Lands data sets used in the ESPA Model to calculate irrigated acreage which were developed using a much more precise process. The 2011 Irrigated Lands data set calculated 179,486 irrigated acres for TFCC. (Ex. 928, at p. 19.) The 2017 Irrigated Lands data set calculated 180,956 acres. *Id*. The 2021 METRIC data used in ESPAM is also more precise than TFCC's shapefile and shows 179,486 irrigated acres. *Id.* at p. 16. The 2017 and 2021 data sets are more recent than the 2013 shapefile. Jennifer Sukow testified that these data sets represent the best science available to determine actual irrigated acreage, and this is the data used in ESPAM for purposes of calculating curtailment under the Methodology Order.

While the Irrigated Lands and METRIC datasets consistently calculate around 15,000 fewer irrigated acres than TFCC's 2013 shapefile, the acreage figures cited above (179,486 and 180,956) still overstate actual irrigated acreage because they encompass both irrigated land and semi-irrigated land (subdivisions, etc.).

Matt Anders testified that he declined to use the best science available and the best data available because he did not believe it satisfies the "clear and convincing" standard of proof. This is mistaken. Once a junior proves that a senior is not irrigating the full number of acres, the Department must use the best science available to determine actual irrigated acreage.

The SWC could not defend their 2013 shapefile as accurately representing actual irrigated acreage. Instead, TFCC's manager and its expert Dr. Brockway, Jr. argued that TFCC has a legal obligation to deliver water to all shares of stock in the company, and the Department should therefore assume that every acre with appurtenant shares is fully irrigated regardless of whether the land is actually irrigated. TFCC's position is untenable and contradictory to the fundamental premise of the CM Rules and the prior appropriation doctrine that a senior can only call for water that will in fact be applied to beneficial use.

Remarkably, TFCC has done nothing to accurately track irrigated acreage in its surface area. It does not maintain a map or record book of any type. TFCC annually reports irrigated acreage to IDWR under Step 1 of the Methodology Order, but there is no data or analysis to support it. Not because TFCC lacks the ability to maintain an accurate GIS shapefile or other database of actual irrigated acres. Other canal companies do this. Water users having water rights with a permissible place of use do this. But because it benefits TFCC to not maintain an accurate inventory of irrigated acreage.

Neither IGWA nor other groundwater users have access to TFCC's water delivery data, making it very difficult if not practically impossible for them to analyze actual irrigated acres. Instead, they must trust TFCC to provide an honest accounting of irrigated acreage.

To improve the accuracy and reliability of the Methodology Order, the Director should remove the 5% irrigated acreage threshold from the Methodology Order and require SWC entities to annually submit an accurate GIS shapefile or other reliably documentation of actual irrigated acreage. The Director should also direct the technical working group to develop a mechanism to review the annual submissions of SWC entities, as contemplated by the Department in 2015. (Ex. 837A, p. 56.)

Until that is done, the Director should use the most recent Irrigated Lands data set or

METRIC data set to determine actual irrigated acreage of SWC entities. This course of action is warranted under the clear and convincing standard of proof because the evidence is undisputed that (i) TFCC is not irrigating all of its decreed acres, (ii) TFCC's 2013 shapefile was relatively imprecise and captures many acres that are not actually irrigated, and (iii) the Irrigated Lands data set and the METRIC data set represent the best science available.

(d) Supplemental Groundwater Use.

In 2015, Department staff recommended that a procedure be developed for reviewing irrigated land data self-reported by SWC entities and accounting for supplemental groundwater use. (Ex. 837A, p. 9.) The recommendation notes that "There was insufficient time for the committee to evaluate [supplemental ground water use]" but that the Department committee recommended reviewing this issue. *Id*. at 56. Eight years later, the *Fifth Methodology Order* states: "At this time, the information submitted or available to the Department is insufficient to determine the extent of supplemental irrigation on lands within the service areas of SWC entities." (Ex. 300, p. 10). Matt Anders testified that they performed no additional analysis or review to address supplemental ground water use since 2015.

TFCC's manager and expert consultant Dr. Brockway, Jr. both testified that there is some supplemental groundwater use within TFCC. IGWA does not have the ability to accurately evaluate supplemental groundwater use for the same reason that it cannot accurately evaluate surface water irrigated acres—because TFCC holds the surface water delivery data. Unless the Department requires TFCC to disclose this data or provide a report of supplemental groundwater use, the Methodology Order will continue to assume there is no supplemental groundwater use and, as a result, overpredict DS.

The Department has a database used in the ESPA Model that assigns a groundwater fraction to mixed-source lands. (Sukow.) As of today, this is the best science and data available to document supplemental groundwater use. The Department should utilize this data when calculating material injury, and task the technical working group with developing a method to reliability track supplemental groundwater use.

(e) Project Efficiency.

CM Rule 42.01.d requires the Director, when determining material injury under the CM Rules, to consider "the rate of diversion compared to the acreage of land served, the annual volume of water diverted, the system diversion and conveyance efficiency, and the method of irrigation water application."

Conveyance efficiency is based primarily on canal seepage and evaporation. The Methodology Order, however, does not evaluate such factors. Instead, it calculates efficiency simply as the product of crop water need divided by gross diversions. If CWN stays constant and diversions go up, the Methodology Order calculates lower efficiency, and vice version.

This approach is problematic because it makes no adjustment for real efficiency improvements. TFCC's manager testified that the company has made major efficiency improvements, including large lining projects. The Methodology Order makes no adjustment as a result of such improvements. Further of issue is the Department's use of total SWC diversions to calculate project efficiency. The *Fifth Methodology Order* states that Project Efficiency is CWN divided by Q_D. Q_D is defined as "irrigation entity diversion of water *specifically put to beneficial use for the growing of crops* within the irrigation entity." (Ex. 300, p. 13) (emphasis added). The

Department currently does not determine what portion of total SWC diversions are specifically put to beneficial use for the growing of crops. (Brockway).

The Director should direct the TWG to develop a mechanism to track real canal efficiency based on real efficiency factors.

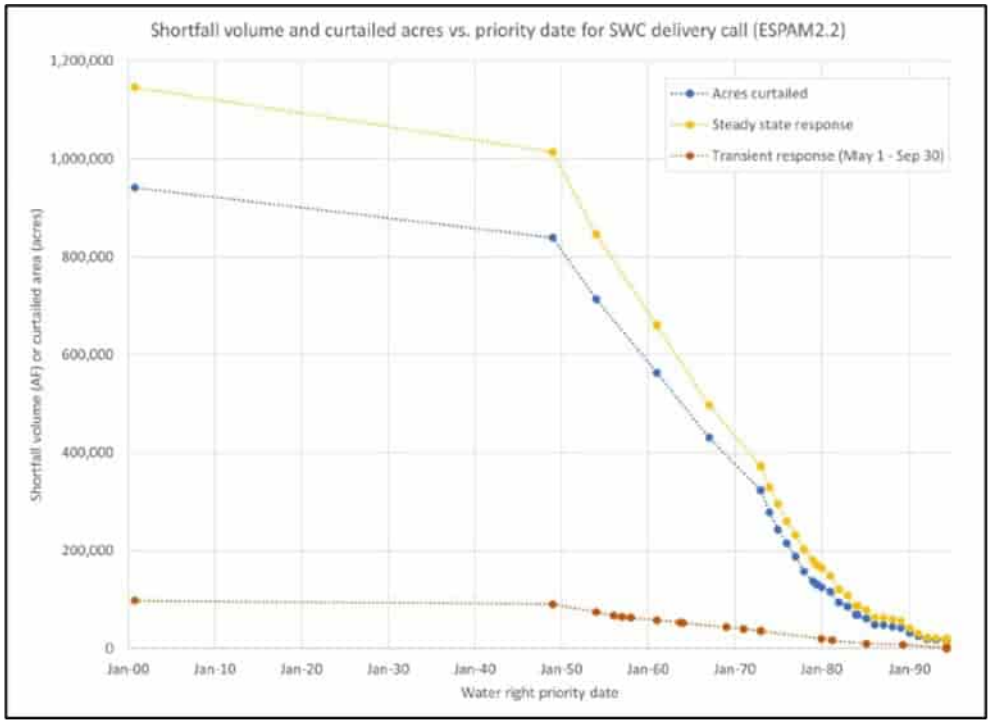
2. The *Fifth Methodology Order* should be amended to apply the futile call doctrine.

One reason curtailment is so excessive under the *Fifth Methodology Order* is because it fails to apply the futile call doctrine, despite CM Rule 20.04 stating: "The principle of the futile call applies to the distribution of water under these rules." The CM Rules defined a "futile call" as "A delivery call made by the holder of a senior-priority surface or ground water right that, for physical and hydrologic reasons, cannot be satisfied within a reasonable time of the call by immediately curtailing diversions under junior-priority ground water rights or that would result in waste of the water resource."

The futile call doctrine has a long history in Idaho. Since at least 1904 it has been applied to surface water administration. *Cartier v. Buck*, 9 Idaho 571, 75 P. 612, 613 (1904); *Moe v. Harger*, 10 Idaho 302, 77 P. 645 (1904). In applying the futile call doctrine, courts have noted that futile call "is a well established part of the prior appropriation doctrine." Order on Pet. for Jud. Rev., at 21, *Clear Springs Foods, Inc. v. Spackman*, No. 2008-0000444 (Gooding Cnty. Dist. Ct. Idaho June 19, 2009) (citing *Gilbert v. Smith*, 97 Idaho 735, 552 P.2d 1220 (1976); *Martiny v. Wells*, 91 Idaho 215, 419 Idaho 470 (1966); *Jackson v. Cowan*, 33 Idaho 525, 196 P. 216 (1921); *Moe v. Harger*, 10 Idaho 302, 77 P. 645 (1904)).

At the hearing, testimony confirmed that IDWR continues to apply the doctrine as between surface water users. For example, Tony Olenichak testified that the doctrine is applied every year in the Teton Basin when the tributaries to the main stem of the Teton River lose their surface water connection. He explained that if shutting off diversions on a tributary stream does not cause surface water to reach the main stem within 5-7 days, the futile call doctrine takes effect and junior users are allowed to divert water out of priority.

Mr. Olenichak explained that the reason tributaries in the Teton Basin lose a surface water connection is because the surface flow in the tributary streams sinks into the ground through gravelly soils. Much if not all of this water flows underground in the shallow aquifer until it daylights via springs along the main stem of the Teton River. Nonetheless, the subsurface connection does not preclude application of the futile call doctrine.



As a minimum, the futile call doctrine must be applied to the SWC delivery call to preclude curtailment of groundwater rights for whom curtailment would provide no additional water to the SWC by the Time of Need. However, the doctrine has historically not been so strict. By definition, it also includes circumstances where curtailment would be wasteful. Indeed, in surface water systems the doctrine takes effect even when the senior would receive a small amount of water via underground connectivity.

Undisputed evidence at the hearing shows that curtailment of groundwater pumping within Carey Valley Ground Water District , Madison Ground Water District, and Henry's Fork Ground Water District will provide zero additional water to the SWC at the Time of Need, and curtailment of groundwater pumping within North Snake Ground Water District, Magic Valley Ground Water District, Jefferson-Clark Ground Water District, and Bonneville-Jefferson Ground Water District will provide essentially no additional water to the SWC when compared to the magnitude of curtailment within those districts. (Ex. 837A, p. 43.)

Based on undisputed evidence, the Director should immediately implement the futile call doctrine in an amended *Fifth Methodology Order*.

3. The *Fifth Methodology Order* should be amended to apply CM Rule 20.03 and prevent the unreasonable exercise of priority by SWC entities.

The change from a steady-state to transient-state model means that exponentially more acres of farmland will be curtailed for each acre-foot of Demand Shortfall calculated under the *Fifth Methodology Order*, as shown in Exhibit 905 cited below. This massive shift requires the Department to revisit the doctrine of reasonable use as set forth in CM Rule 20.03: "An appropriator is not entitled to command the entirety of large volumes of water in a surface or ground water source to support his appropriation contrary to the public policy of reasonable use of water as described in this rule."

Comparison of priority dates calculated for April DS Forecasts (May 1 Curtailment), Ex. 90, p. 13.

Courts have historically curbed the exercise of priority in circumstances where it would significantly impede full development of the state's water resources. Ironically, the seminal case involved development of the Twin Falls and North Side canal systems. *Schodde v. Twin Falls Land & Water Co.*, 224 U.S. 107 (1917). In *Schodde*, a senior-priority water user's ability to divert water from the Snake River was nullified by development of the Twin Falls Canal Company (TFCC) and North Side Canal Company (NSCC) diversions. The senior sued, but the court denied their claim, holding that the senior's appropriation "lacks one of the essential attributes of an appropriation—it is not reasonable." *Id*. at 118. The court explained:

> In this arid country, where the largest duty and the greatest use must be had from every inch of water, in the interest of agriculture and home building, it will not do to

> say that a stream may be dammed so as to cause subirrigation of a few acres, at a loss of enough water to surface irrigate ten times as much by proper application.

Id. at 124-25. Were it not for the sideboard of reasonableness imposed upon the exercise of priority, TFCC and NSCC would not exist. Now, however, the shoe is on the other foot. It is TFCC that desires to exercise priority in a manner that would eliminate ten times as much water as would accrue to TFCC from curtailment.

Moreover, this is not a situation where TFCC will go without water in the absence of curtailment. TFCC's water supply consists primarily of "base flow" from the Snake River. While reach gains from the ESPA have declined since 1980, the decline has had little if any impact on TFCC's water supply. TFCC's expert, Dr. Brockway, testified that diversions have remained steady over the last 46 years. Thus, the decline in reach gains does not appear to have affected TFCC's water supply. The decline presumably affected other SWC entities who have junior-priority natural flow rights but much higher storage reserves than TFCC which have enabled them to absorb declining reach gains without experiencing material injury.

In all but four of the last 46 years, TFCC's annual diversion volume has stayed within 75,000 acre-feet, or seven (7) percent, of average. Even in the most extreme drought year TFCC's diversion volume was within 151,000 acre-feet, or 14 percent, of average. (Ex. 4, p. 6-7). Thus, even on the occasion when the methodology order accurately predicts a DS, curtailment of hundreds of thousands of acres of groundwater irrigated farmland will do no more than increase TFCC's water supply by a few percentage points.

It strains credulity to think it reasonable to exercise priority in a manner that curtails ten or fifty times more water than TFCC would receive from curtailment, especially when TFCC will receive nearly full supply of water without curtailment, and when a shortfall can be remedied through more efficient water conveyance and usage practices.

4. Due Process and the Idaho Administrative Procedures Act.

IGWA maintains that Director violated due process and the Idaho Administrative Procedures Act by (i) failing to hold a hearing before issuing the *Fifth Methodology Order*, (ii) rushing into an after-the-fact hearing without providing adequate time for groundwater users to fully analyze and be prepared to fairly address all components of the *Fifth Methodology Order*, (iii) denying discovery of information relevant to the *Fifth Methodology Order*, (iv) denying the groundwater users subpoena of Mathew Weaver, and (v) refusing to allow an offer of proof of evidence that would have been submitted through Mr. Weaver. In support of this position, IGWA incorporates by reference *Ground Water Districts' Brief in Support of Motion for Stay, Motion for Injunctive Relief, Motion to Compel, Motion for Expedited Decision, and Application for Order to Show Cause* filed May 19, 2023, in Ada County Case No. CV01-23-08187.

The methodology order defines a nine-step process of water rights administration under the SWC delivery call. While implementation of the process is inherently time-sensitive to account for contemporary water supply conditions, any review and amendment of the process is not time-sensitive. Development of the first methodology order was urgent because there was no prior method in place for administering water rights under the SWC call, but this is not true for subsequent changes to the methodology. The record is undisputed that the Department could have held a hearing *before* issuing the *Fifth Methodology Order*.

Failing to hold a hearing first skews the process because any significant changes made to the *Fifth Methodology Order* after-the-fact is evidence that the initial order was mistaken. This

naturally creates pressure on the Department not to make any significant changes after-the-fact, particularly where the decision has enormous consequences. It would be extremely difficult for any human to admit an error that wrongly exposed hundreds of thousands of acres of farmland to curtailment and forced junior-priority groundwater users to needlessly spend millions of dollars renting storage for mitigation.

When the decision is made before a hearing is held, the evidence presented after-the-fact can no longer be viewed by the decisionmaker in a neutral manner, at least subconsciously, but with a slant aimed to justify the original order. It is human nature.

The decision to not hold a hearing before issuing the *Fifth Methodology Order*, combined with the decision to keep certain types of information out of the record, has fostered distrust by those affected by the order and undermined the credibility of the Department. Whether or not the Department has something to hide, "the coverup is worse than the crime."

The best way to restore trust would be for the Department to vacate the *Fifth Methodology Order* and initiate a transparent, collaborative process for reviewing and analyzing the methodology, followed by a hearing before issuances of an amended methodology order. The evidence presented at the recent hearing provides a solid foundation for this type of process. In the meantime, the Department can proceed with water rights administration under the *Fourth Methodology Order*.

The second best way to restore trust would be to immediately change those components of the *Fifth Methodology Order* for which the evidence clearly warrants a change, as indicated above, and initiate a transparent, collaborative process for further analyzing those components which require further analysis.

CONCLUSION

For the foregoing reasons, IGWA respectfully requests that the Director amend the Fifth Methodology Order and issue instructions to the Department's technical working group as outlined above in the Summary section of this brief.

DATED this 16th day of June, 2023.

Attorneys for Bonneville-Jefferson Ground Water District

STATE OF IDAHO

DEPARTMENT OF WATER RESOURCES

IN THE MATTER OF THE DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY AND FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **BONNEVILLE-JEFFERSON'S POST-HEARING BRIEF AND JOINDER IN SUPPORT OF IGWA'S POST-HEARING BRIEF**

The Bonneville-Jefferson Ground Water District (hereafter "Bonneville-Jefferson"), acting for and on behalf of its respective members, through counsel, submits its *Post-Hearing Brief*, pursuant to the Director's instructions and request at the close of the administrative hearing on June 6-9, 2023. Bonneville-Jefferson also joins in support of *IGWA's Post-Hearing Brief*.

OVERVIEW

This brief addresses a portion of the evidence presented during the June 6-9, 2023, hearing before the Idaho Department of Water Resources (hereafter "Department") on the April 21, 2023,

Fifth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover (hereafter "Fifth Order") (Ex. 300) and the Final Order Regarding April 2023 Forecast Supply (Methodology Steps 1-3) (hereafter "April As Applied Order") (Ex. 301).

During the hearing, the parties presented testimony from various lay and expert witnesses and various exhibits were presented and admitted into the record. At the close of the hearing the Director allowed the parties one week to submit post-trial briefing. He requested that the parties not provide detailed commentary on the nuanced testimony from the hearing. Rather, he identified legal questions for the parties to address.

Given the time frame set by the Director, Bonneville-Jefferson has prepared its brief having not received nor reviewed all the hearing transcripts. This brief is based upon the exhibits admitted at the hearing and counsel's notes on testimony from the hearing.

APPLICABLE LEGAL STANDARDS

The hearing in question is to address the findings of fact and conclusions of law of an agency order. In *Idaho Ground Water Assoc. v. Idaho Dep't of Water Res.*, 160 Idaho 119, 137, 369 P.3d 897, 915 (2016), the Idaho Supreme Court explained:

> Idaho Code section 67–5248 provides that an agency order shall include "a reasoned statement in support of the decision" and "shall be accompanied by a concise and explicit statement of the underlying facts of record supporting the findings." I.C. § 67–5248(a). The order should "identify facts, as well as inferences drawn from the facts upon the application of its expertise and judgment, which underlie its decision. Such an explanation is essential to meaningful judicial review." *Woodfield v. Bd. of Prof'l Discipline of Idaho State Bd. of Med.*, 127 Idaho 738, 747, 905 P.2d 1047, 1056 (Ct.App.1995).

In short, the Director bears the burden of supporting his order, but the answer to the Director's questions about respective burdens of proof is probably best set forth in *Jasso v. Camas Cnty.*, 151 Idaho 790, 796, 264 P.3d 897, 903 (2011):

> If there is to be any meaningful judicial scrutiny of the activities of an administrative agency—not for the purpose of substituting judicial judgment for administrative judgment but for the purpose of requiring the administrative agency to demonstrate that it has applied the criteria prescribed by statute and by its own regulations and has not acted arbitrarily or on an ad hoc basis—we must require that its order clearly and precisely stated what it found to be the facts and fully explain why those facts lead it to the decision it makes. Brevity is not always a virtue.
>
> ...
>
> We wish to make it clear that by insisting on adequate findings of fact we are not simply imposing legalistic notions of proper form, or setting an empty exercise for local governments to follow. No particular form is required, and no magic words need be employed. *What is needed for adequate judicial review is a clear statement of what, specifically, the decisionmaking body believes, after hearing and considering all the evidence, to be the relevant and important facts upon which its decision is based. Conclusions are not sufficient*.
>
> *Workman Family P'ship.*, 104 Idaho at 37, 655 P.2d at 931 (emphasis original) (citations and quotations removed).

This case illustrates that the Director's decision must show that he considered the applicable rules and statutes and identify precisely what he found to be facts. In this regard, the conclusions in the Fifth Methodology Order must consider the criteria set forth in the Rules for Conjunctive Management and it must precisely identify the facts upon which each conclusion is based. However, in making these determinations, the Director must also use the "best science available." *Clear Springs Foods, Inc. v. Spackman*, 150 Idaho 790, 813 (2011).

The Proposed Finding of Fact set forth below, as well as the arguments presented in IGWA's Post-Hearing Brief, show that the Fifth Methodology Order did not meet this standard. For Example, no factual basis was identified justifying the sudden move from steady state to

transient modeling, as this was, as Jennifer Sukow stated, a policy decision. The Order did not consider, nor did the Director allow evidence, regarding futile call. Where the parties were barred from obtaining or presenting evidence regarding the Director's factual basis for policy decisions, the move to transient modeling falls short of the standard above.

Furthermore, the Fifth Methodology Order is not supported in fact with regard to certain adjustments not being included in the model. For example, technically defensible data sets exist to make adjustments for supplemental ground water and to calculate and exclude fallowed acres in the Twin Falls Canal Company.

PROPOSED FINDINGS OF FACT

A. Testimony of Bryce Contor

Following are the proposed findings of fact based upon the testimony, expert report, and exhibits provided by Bonneville-Jefferson's retained expert, Bryce Contor, of Rocky Mountain Environmental Associates, Inc:

1. The Fifth Amended Methodology Order does not present a technical rationale supporting implementation of transient modeling because:

   a. IDWR has had access to the current understanding of the general implications of transient vs. steady-state modeling since at least 1999, and access to the specific implications of a curtailment context since 2006;

   b. The 1999 SRPAM model had stress periods even shorter than the current model;

   c. Though its stress periods were longer than the current model, the 2006 ESPAM1.1 model was designed and deployed to represent effects on an irrigation-season time scale;

d. The 2013 ESPAM2.1 model had identical stress periods to the current ESPAM2.2 model.

e. The transient version of the model can be used to represent temporary curtailment of water rights.

f. No new methods or information has been developed since 2006 that would substantially effect the impacts of transient modeling.

2. A technically correct Finding of Fact #83 is:

> Merriam-Webster's Dictionary defines stead-state as "a state or condition of a system or process… that does not change in time. "A steady state ESPAM simulation based on input values of acre feet of curtailment can only indicate total acre feet of accrual to modeled reaches of the Snake River and tributary springs resulting after the effects of curtailment have fully been realized. For example, a steady-state analysis of curtailment of 1,000-acre feet would indicate where the 1,000 acre feet of accrual eventually would be expressed, but would not describe the timing of arrival of accruals.

3. A technically correct Finding of Fact #84 is:

> Steady-state analysis does not calculate the time to reach steady-state conditions nor describe the seasonal timing of the impacts, but only estimates the spatial distribution of accruals. To estimate the timing of accruals, transient modeling must be employed.

4. The Department has not set criterion for accuracy and precision of the ESPAM2.2 results.

a. Unless the criteria for accuracy and precision are very low, ESPAM2.2 is not sufficiently precise for monthly estimation of effects to the Near Blackfoot to Minidoka reach, for decisions that have the gravity of substantial volumes of supply for the SWC.

5. The use of ESPAM modeling in the Fifth Methodology Order is not technically defensible because ratios of relief to cost are not considered in light of modeling precision, and when the underlying policy is not adjusted for spatial and temporal differences in response.

6. The arguments presented against considering supplemental groundwater use within the SWC are not factually correct because it is technically possible and reasonably achievable to assess and address supplemental groundwater use within the SWC:

a. Since the initial development of ESPAM1.0 in the early 2000s, the extent and effect of supplemental groundwater irrigation has been calculated for the parts of the SWC Service Areas that are within the ESPAM model boundary.

b. The data and methods that have been used in the ESPAM model are readily available and applicable to the parts of the SWC Service Areas that are outside the ESPAM model boundary.

c. As a result of measurement orders, the measurement and report of well discharge data, and the availability of these data in IDWR's Water Measurement Information System (WMIS) are much more robust than in the early 2000s when these calculations first were undertaken, and the methods developed.

d. IDWR has known, or could have known, since at least 2015 that these data would be important to a correct calculation of Reasonable In Season Demand. The intervening eight years would have been sufficient time to apply the existing data and methods, or to improve them, for purposes of the methodology.

e. Because of the existence of these methods and data, a defensible adjustment for supplemental groundwater use within the SWC Service Areas is reasonably within reach, on a technical basis.

f. Also, substantially more acre feet of diversion are required to support a surface-water irrigated acre than a groundwater-irrigated acre because the curtailment requirement is multiplied by the following:

   i. An acre of groundwater irrigation requires fewer acre feet of gross diversion than does an acre of surface-water irrigation supplied by a long canal.

   ii. For most groundwater-irrigated lands, more accrual from curtailment arrives at nontarget reaches than arrives at the Near Blackfoot to Minidoka Reach.

   iii. The curtailment requirement again is multiplied by the fact that more accruals from curtailment occur in future years than in the year of need.

   iv. Thus, neglecting a single acre of supplemental irrigation within the SWC Service Area results in needless curtailment of many groundwater-irrigated acres.

   v. Therefore, strictly on a technical basis, the refinement of quantifying the effect of supplemental irrigation within the Surface Water Coalition service area could provide substantial relief to a broad constituency of Idaho water users.

g. Deficiencies that might exist in the groundwater-diversion data from IDWR's Water Measurement Information System will tend to under-estimate rather than

over-estimate pumping, resulting in a conservative over-attribution of calculated surface-water shortfall. This is conservative on behalf of the senior users.

h. The following factors multiply the effect of ignoring supplemental groundwater use within the SWC:

i. Because of inherent characteristics of surface-water delivery systems, supplying one acre with surface water requires substantially more water than supplying an acre with groundwater.

ii. Not all effects of curtailment of groundwater propagate to the Near Blackfoot to Minidoka reach, so more than one acre foot of curtailment is required to produce one acre foot of accrual.

iii. When obligations are calculated on a transient basis, the temporal delay in propagation creates an additional multiplier of effort.

7. The Department's use of transient modeling in the Fifth Amended Methodology Order is not technically defensible where it fails to model and account for future accruals to target, and non-target reaches.

8. Technical methods exist to inform a coherent plan under either a transient or a steady state paradigm. This could be accomplished by aligning the calculation and expectations of relief to the physical time frame of aquifer response by considering future accruals to target and non-target reaches.

9. Transient modeling is more technically defensible if, when accounting for non-target accruals, the accounting decay of accruals, and the spatial assignment, match reality. The transient aquifer response functions with double-entry accounting technologies should be linked

and the hydrologic realities of groundwater/surface water, the legal requirements of prior appropriation water law, and the economic requirements for equitable and efficient allocation of resources must be honored.

10. A reasonable and technically defensible way exists to identify fallowed acres in the methodology order. If the purpose is to establish a Permissible Place of Use or a Service Area, fallowed acres should be included. If the purpose were to describe the total amount of irrigation in a single year, the acres should not be included.

11. Failing to exclude fallowed acres in and adjust for such acres, distorts the results in favor of SWC.

12. IDWR irrigated data land sets contain the information necessary to generate a more technically defensible calculation of the SWC irrigated acres than the shapefiles provided by SWC.

13. Omitting supplemental ground water adjustments in the model creates a "multiplier" effect. The same thing applies to the 5% "no change" standard for accepting the SWC's representation of its acreage. If a surface-water-irrigated acre required nearly six acre feet of diversion and a groundwater irrigated acre required two acre feet, approximately three acres of groundwater reduction would be needlessly indicated for a one-acre over-estimate of surface-water irrigation. Because only about half the accruals from curtailment, on average, arrive at the Near Blackfoot to Minidoka reach, six acres would have to be curtailed to achieve the effect of three acres of reduction. If the IDWR estimate is correct that only 9% to 15% of accruals arrive in the first five months of the irrigation season, then an additional multiplier of ten must be applied, so that an over-estimate of one acre of surface-water irrigation could curtail 60 acres of groundwater beneficial use.

14. The 2023 As-Applied Order employs Steady State analysis to calculate IGWA's proportionate responsibility for mitigation, but these calculations are not defined by the Fifth Amended Methodology Order.

15. The mechanisms that drive fallowed acres or foregone irrigation are persistent year to year. Omitting them from an irrigated-lands map is the best way to ensure that the map represents the typical number of acres irrigated in any one year. This is true even though the particular locations of fallow or foregone irrigation will change from year to year.

16. A single-year curtailment calculated using steady-state modeling cannot produce full relief for the SWC. However, for many of the hindcast years, neither would a single-year curtailment based on transient modeling have been able to produce full relief.

17. IDWR processing of irrigated-lands data includes remote-sensing data from multiple dates in the given year, as well as hand work to refine results. These are the best available science for determination of irrigated area.

18. Use of WMIS pumping data allows direct calculation of the contribution of supplemental groundwater pumping, regardless of the complexity of the distribution system. Failures in WMIS data that might occur would cause an underestimate of pumping volume, which would result in a bias in results that would tend to increase the calculated shortfall.

19. The "best available science" for considering irrigation returns is to use the data that are available, because omission of unmeasured returns is conservative in that it would tend to increase the calculated shortfall. Applying an imperfect data set still is conservative in behalf of producing an over-calculation of shortfall.

20. Omission of known factors, for which data and methodology exist, makes the Fifth Amended Methodology Order technically incomplete and therefore does not represent the best available science.

21. Either transient or steady-state modeling can be part of a technically valid approach that is coherent in administration relative to the temporal implications of the method chosen and the characteristic response time through the aquifer.

22. Although Matt Anders testified that, in considering anticipated reservoir carryover, IDWR consults with Water District 01, such practice is not specified in the Fifth Amended Methodology Order. This practice should be specified in the Order to ensure consistency in the data used by the Department.

23. TFCC's estimation of its irrigated acres is not reliable because a reliable calculation of a 5% or more variation in 196,000 irrigated acres cannot be determined accurately without conducting measurements on the ground, in the field, or with robust remote-sensing analysis with field verification on a statistically valid sample.

24. IDWR did not implement any of the ground water users' suggestions to the technical working group but implemented some of SWC's suggestions.

25. The Department's omission of an adjustment to the model accounting for SWC return flows from field runoff drain systems cuts to the benefit of SWC.

26. The consequences of the degrading R square value in prediction equation(s) are that it indicates reduced ability to be sure that SWC receives adequate supply. Conversely, it could needlessly cause an excessive burden to ground water users.

27. The consequence of neglecting Portneuf, Blackfoot, and Henry's Fork in 2023, where the snowpack above Heise was anomalously low relative to all the other headwaters basins, was an inflated estimate of shortfall. The consequence will be to depress the estimation of shortfall on a year when above-Heise snowpack is anomalously high relative to the others.

28. Technical issues arise from the Department having not established any criterion for minimum conservatism of the RSID calculations, and from not having identified a mechanism to calculate the combined degree of conservatism. Too-little conservatism would harm the SWC and too-large would harm groundwater appropriators. Lack of calculation methods means that the combined effect remains unknown, and lack of a criterion means that even if it were known, it could not be evaluated. Contributors to conservatism include at least the following:

a. Conservatism in selection of baseline diversion volume;

b. Conservatism in selection of temperatures for calculation purposes;

c. Conservatism in selection of precipitation estimates.

29. The River Package does not allow proper representation of the communication between the River and the Aquifer, given that it is a single layered model. While the River Package can represent communication between the river and the top of the aquifer within the river cell, it cannot properly represent the complex transit of water to upper part of the river cell from deep in the aquifer, or from deep in adjacent cells.

B. Additional Facts

Following are other relevant facts supported by the evidence presented at the hearing:

1. Bonneville-Jefferson's retained expert, Rocky Mountain Environmental Associates, Inc., was not invited and did not participate in the technical working group for the Fifth Methodology Order.

2. The Department did not represent to members of the Technical Working Ground for the Fifth Methodology Order that the Department would implement transient modeling in its calculations for the 2023 irrigation season.

3. The parties were only permitted six weeks to conduct review and analysis of the Fifth Methodology Order, acquire evidence, depose witnesses, retain experts, and prepare legal arguments before the Department conducted the June 6, -9, 2023, hearing.

4. Bonneville-Jefferson and its experts did not have sufficient time to conduct full analysis that that would have provided the Department with information which could have improved the accuracy of the Fifth Methodology Order.

CONCLUSION

Based on the foregoing, the Director can and should modify his Order to consider all the factors in the Rules for Conjunctive Management and include the recommended adjustments that will improve the model.

DATED: June 16, 2023

STATE OF IDAHO

DEPARTMENT OF WATER RESOURCES

IN THE MATTER OF THE DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY AND FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **BINGHAM GROUNDWATER DISTRICT JOINDER IN IGWA'S AND BONNEVILLE-JEFFERSON'S POST-HEARING BRIEF, AND SUPPLEMENTAL BRIEF**

On June 6-9, the Department held a hearing to receive evidence and testimony regarding the fifth amended methodology order-and the as-applied order, issued on April 19, 2022. Bingham Ground water joins with IGWA in its post hearing brief, and offers a short supplemental brief regarding an issue that is intertwined with many of the arguments contained in IGWA's briefing, and with the methodology order that should be addressed by the department. The methodology order encourages and rewards higher diversions by the SWC.

The Methodology

Calculating Reasonable In-Season Demand involves complex averages of Crop Water Need (CWN), which involves Consumptive Use of a Specific Crop (ET_i) Precipitation (W_e), and irrigated area (A_i). However, when CWN is placed back into the formula to determine (RISD), all those calculations are essentially neutralized by a fluid and undefined project efficiency. When it is boiled down, Reasonable In-Season Demand (RISD) is just Diversion (Q_D); or average (Q_D) ran through a 14-year averaging process that's benefits are unexplained.

The simple equation in the methodology order outlined in paragraph 62 is as follows:

IDS=FS-RISD

Where:

IDS = demand shortfall for specified evaluation points throughout the season,

FS = forecasted supply adjusted for specified evaluation point during the season, and

RISD = reasonable in-season demand from above.

The methodology order goes on to show how each part of this equation is determined. Paragraph 33 of the Fifth methodology order shows the calculation for crop water need CWN, which is used to find the Reasonable in-season demand (RISD).

$$CWN = \sum_{i-1}^{n} (ET_i - W_e) A_i$$

Where,

CWN = crop water need

ET_i = consumptive use of specific crop type,

W_e = effective precipitation,

A_i = total irrigated area of specific crop type,

i = index variable representing the different specific crop types grown within the irrigation entity, and

n = upper bound of summation equal to the total number of different specific crop types grown within the irrigation entity.

The crop water need equation involves complex calculations that unfortunately are rendered moot because of the project efficiency algorithm and how it is used the methodology

calculations. The project efficiency algorithm is outlined in paragraphs 28-29 in the fifth methodology as follows:

$$\mathbf{E_p} = \frac{CWN}{Q_D}$$

Where:

E_p = project efficiency,

CWN = crop water need, and

Q_D = irrigation entity diversion of water specifically put to beneficial use for the growing of crops within the irrigation entity.

According to this, if CWN is high, then efficiency is proportionately high. If CWN is low, then efficiency is proportionately low. Because there is no standard efficiency, any efficiency is acceptable in the Reasonable In-Season Demand calculation. The testimony of the Surface Water Coalition's Expert Dr. Brockway highlighted this flaw as to acres and explained how acres do not matter in the methodology calculations. For the same reason that acres do not matter, CWN is nullified by an ever-expanding efficiency that assures any amount of diversion is reasonable and demanded. The only thing that calculating for CWN shows is how much of the overall diversion (Q_D)[1] is going to the crop water need, and how much is project efficiency; but these are arbitrary classifications because it is impossible, under this equation, to over-divert. Everything diverted is either crop water need, or project efficiency, and both are used to make up Reasonable In-Season Demand, ergo, everything diverted is Reasonable In-Season Demand.

The crop water need (CWN) and project efficiency (E_p) are used in determining the Reasonable In-Season Demand. The calculation for this is set out in paragraph 41 of the fifth methodology order as follows.

[1] Although technically there are some adjustments to the overall diversion that can be made as outlined in paragraph 30 of the methodology order, the testimony of Matt Anders is that Q_d is the diversion, and for the sake of this analysis, diversion is meant to be as adjusted in paragraph 30, for example if there was in-season recharge, or diversion shared with another entity.

$$RISD_{milestone_x} = \sum_{j-1}^{n} \left(\frac{CWN_j}{E_{p-j}}\right) + \sum_{j-m+1}^{7} BD_j$$

Where:

$RISD_{milestone_x}$ = reasonable in season demand at specified evaluation milestones during the irrigation season,

CWN = crop water need for month j,

E_p = baseline project efficiency for month j,

BD = baseline demand for month j,

j = index variable, and

m = upper bound of summation, equal to the month calculation occurs, where April = 1, May =2, … October = 7.

This equation represents crop water need (CWN) over baseline project efficiency for each month ($E_{p,j}$) to ultimately get the reasonable in-season demand (RISD). In April, this equation relies completely on the baseline year demand (BD), and slowly incorporate the in-season demand for the current year as that data becomes available. However, this equation is overly complex and misleading in what is actually being calculated.

Looking closer at CWN over E_p for month j $\left(\frac{CWN_j}{E_{p-j}}\right)$, The equation can be expanded out using the formula for baseline project efficiency ($E_p = \frac{CWN}{Q_D}$) and can be written as $\frac{CWN}{\frac{CWN}{Q_D}}$.To solve $\frac{CWN}{\frac{CWN}{Q_D}}$, simply flip and multiply as follows: $\frac{\cancel{CWN}}{1} \; x \; \frac{Q_D}{\cancel{CWN}}$ or $\frac{Q_D}{1}$ The crop water need is canceled out and we find that $\left(\frac{CWN_j}{E_{p-j}}\right) = Q_D$. When placed back into the original equation, we get: $RISD_{milestone_x} = \sum_{j-1}^{n} (Q_D) + \sum_{j-m+1}^{7} BD_j$. In other words, Reasonable in-season demand is just an overly complex calculation that justifies whatever the diversion (Q_D) happens to be, just calculated on monthly intervals. Simplified even further, RISD=Q_D. Ultimately, the calculations for crop water need will only tell you how much of the diversion was used for crop water need, and whatever is left is project efficiency. If the crop water need goes up, project efficiency goes up (meaning if more of the diversion is going to crop need then less of the diversion is lost in

efficiency). If the crop water need goes down, the project efficiency goes down (meaning if less of the diversion is going to the crop demand, then more of the diversion is lost in efficiency calculations). This is illustrated in the fifth methodology order in the table in paragraph 32. Here we see that as the crop water needs are up in the middle of summer, the efficiency goes up.

Although this example illustrates that crop water need isn't actually accounting for anything, and is the equivalent of pretext calculations to justify whatever is diverted as "reasonable in-season demand" there are a few more complex layers to this equation. Unfortunately, when one dives into the details, the reasonable in-season demand only becomes more unreasonable.

The equations do a poor job of showing that the CWN_j used in the RISD calculation is slightly different from the CWN used in the E_p calculation because E_p is actually a fourteen-year rolling average of efficiency as outlined in paragraph 32 of the fifth methodology order.[2] The department does not explain why doing a fourteen-year rolling average of E_p is useful, or what the technical significance is, but that is what is done. In this case, there is an incentive for the SWC to increase diversions as much as possible because doing so would decrease efficiency. If efficiency is decreased for any year, the overall average efficiency is decreased, and RISD is increased making a shortfall more likely. In other words, increased diversions are rewarded with increased probability for injury.

If the department truly wants to account for actual acres and crop water need in a meaningful way, it must adopt a minimum efficiency standard. Without a minimum efficiency standard, all the calculations regarding crop water need are meaningless. Also, the number of acres irrigated become meaningless.

At the crux of many of the issues raised in IGWA's post hearing brief, is the lack of standard for any use, diversion, or efficiency. This is not to place blame on SWC because the inverse is also true. If they reduce diversions, the methodology order would actually punish them for doing so. Reduced diversion would produce a rise the average efficiency, thus lowering the calculated RISD. For example, SWC will divert at ¾ inch even if 5/8 is sufficient, because reducing to 5/8, although sufficient[3], would make calculated injury less likely.

[2] The exception to this is the April and October adjustment outlined in Paragraphs 42-46 of the Fifth Methodology Order.
[3] As argued in IGWA's brief.

The conclusions of law contained in paragraphs 5 and 6 regarding beneficial use, least wasteful use, and optimal development of water resources in the public interest are not only unsupported by the findings of fact, but are actually frustrated by the methodology order and findings of fact. The department should look at reasonable efficiency standards that would allow the Reasonable In-Season Demand to actually account for irrigated acres, and crop water need. The methodology order would have objective standards that actual reflect a Reasonable In-Season Demand, not just default to whatever is diverted. Not only that, the methodology order should incentivize reasonable diversion reductions, not punish SWC if they ever reduced.

Due Process

Bingham Ground Water District joins with IGWA and Bonneville-Jefferson Ground Water District in their briefing regarding Due Process, and adds as follows. Groundwater users are frustrated by the process of this methodology order change. The changes bring wide sweeping implications, and the explanation only refers to data and court decisions that are decades old. Why was this such an emergency? Why was this rushed into an order without a hearing when IGWA asked for a hearing on potential changes to the methodology order last fall? Groundwater pumpers are even more frustrated that when they asked for more answers, there were shut down through limitations on the scope of Discovery, and limitations on the scope of the hearing. In preparing its final decision, groundwater users request that the Department explain why the change was made so hastily and without a hearing. Please explain the policy reasons, outside the technical information which department employees were not allowed to testify about, but did testify exist. Groundwater users want to understand the policy decisions and reasons that let do increasing acres curtailed for a given injury by roughly 10 times.

DATED this 16 day of June, 2023.

BEFORE THE DEPARTMENT OF WATER RESOURCES

OF THE STATE OF IDAHO

IN THE MATTER OF THE DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY AND FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **SIXTH FINAL ORDER REGARDING METHODOLOGY FOR DETERMINING MATERIAL INJURY TO REASONABLE IN-SEASON DEMAND AND REASONABLE CARRYOVER**

BACKGROUND

On April 19, 2016, the Director ("Director") of the Idaho Department of Water Resources ("Department") issued his *Fourth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* ("Fourth Methodology Order"). The Fourth Methodology Order: (1) explained how the Director would determine material injury to storage and natural flow water rights of members of the Surface Water Coalition ("SWC")[1]; (2) established methods for quantifying material injury to SWC storage and natural flow water rights as predictive and actual demand shortfalls; (3) established methods for quantifying mitigation obligations by holders of junior priority ground water rights for shortfalls in predictive and actual SWC water demands; and (4) established a method for determining a priority date for curtailment if mitigation obligations are not satisfied.

The processes established in the Fourth Methodology Order for determining material injury are not immutable. Updates to the methodology order based on additional data and analyses were always anticipated:

> Recognizing his ongoing duty to administer the State's water resources, the Director should use available data, and consider new analytical methods or modeling concepts, to evaluate the methodology. As more data is gathered and analyzed, the Director will review and refine the process of predicting and evaluating material injury. The methodology will be adjusted if the data supports a change.

[1] The SWC is comprised of A&B District, American Falls Reservoir District #2, Burley Irrigation District, Milner Irrigation District, Minidoka Irrigation District, North Side Canal Company, and Twin Falls Canal Company. Each entity holds separate senior surface natural flow water rights and has separate storage contracts for storage water space in the reservoirs.

Fourth Methodology Order, Conclusion of Law 17; *see also In Matter of Distribution of Water to Various Water Rts. Held By or For Ben. of A & B Irrigation Dist.*, 155 Idaho 640, 645, 315 P.3d 828, 833 (2013) ("[t]he concept of a baseline is that it is adjustable . . . ."). The prediction and determination of rights and obligations of the holders of senior priority and junior priority water rights respectively must: (1) apply the best available science and underlying water data; (2) consider changing climatic and cropping patterns; and (3) adhere to the most recent decisions of the courts related to water administration.

Many of the data sets the Department relied upon in the Fourth Methodology Order have been expanded and now include additional years. Furthermore, the Director has had time to review and consider the implications of court decisions that require the Director to address a mitigation deficiency in the year it occurs. As a result, the director issued the *Fifth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* ("Fifth Methodology Order") on April 21, 2023. The purpose of the Fifth Methodology Order was to update the Director's methodology for determining material injury to storage and natural flow water rights either held by or committed to members of the SWC consistent with the Director's ongoing obligation to use the best available science and information.

On April 21, 2023, the Director also issued his (1) *Final Order Regarding April 2023 Forecast Supply* ("April 2023 As-Applied Order"), as well as a (2) *Notice of Hearing, Notice of Prehearing Conference, and Order Authorizing Discovery* ("Notice of Hearing"), which set a hearing on the Fifth Methodology and As-Applied Orders for June 6–10, 2023 ("June 6 Hearing"). During the June 6 Hearing, the parties proffered testimony and evidence regarding the Fifth Methodology Order and the April 2023 As-Applied order.

The purpose of issuing this *Sixth Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* ("Sixth Methodology Order") is to correct data in the Fifth Methodology Order found to be in error during the June 6 Hearing. This Sixth Methodology Order also edits a few other non-substantive matters in the Fifth Methodology Order.

FINDINGS OF FACT

I. Overview of the Methodology for Determining Material Injury to Water Rights by Determining Reasonable In-Season Demand and Reasonable Carryover

This methodology is based on the selection of a recent analogous, baseline year to predict reasonable in-season demand ("RISD") for the senior priority surface water rights during the upcoming irrigation season.

1. The method for determining material injury to water rights by determining RISD and reasonable carryover should be based on updated data, the best available science, analytical methods, and the Director's professional judgment as manager of the state's water resources. In the future, climate may vary and conditions may change; therefore, the methodology may need to

be adjusted to consider a different baseline year or years ("BLY") or changes to other components.

2. In-season demand shortfall ("IDS") will be computed by subtracting RISD from the forecast supply ("FS"). In-season demand shortfall is computed using the following equation:

$$IDS = FS - RISD$$

3. If the FS is greater than the RISD, there is no demand shortfall. If the FS is less that the RISD, the negative difference is the demand shortfall. Initially, RISD is equal to the historic demands associated with a BLY as selected by the Director, but will be corrected during the season to account for variations in climate and water supply between the BLY and actual conditions.

4. Reasonable carryover shortfall will be computed by subtracting reasonable carryover from actual carryover, where reasonable carryover is defined as the difference between a baseline year demand ("BD") and projected typical dry year supply. Reasonable carryover shortfall will be computed using the following equation:

Reasonable Carryover Shortfall = Actual Carryover – Reasonable Carryover

5. If actual carryover exceeds the reasonable carryover, there is no reasonable carryover shortfall. In contrast, if reasonable carryover exceeds the actual carryover, the negative difference is the reasonable carryover shortfall.

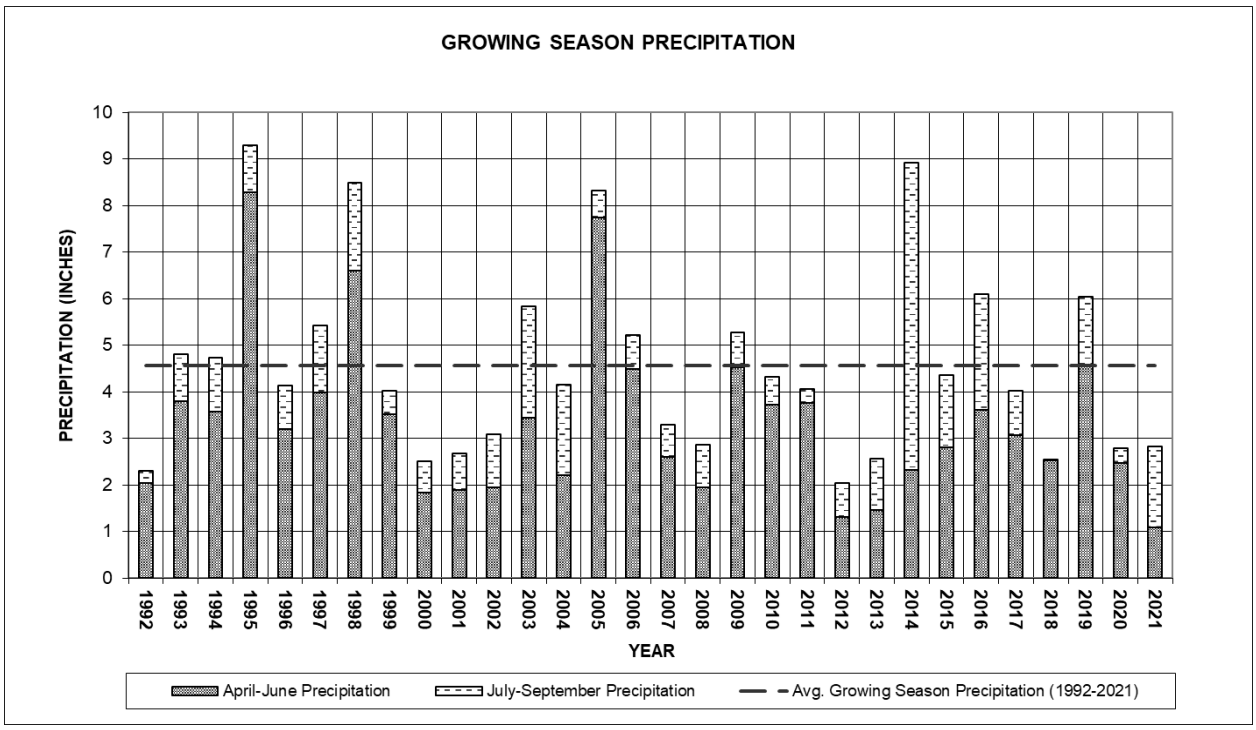
6. The concepts underlying the selection of the BLY, determination of in-season demand shortfall, and reasonable carryover shortfall will be discussed in detail below.

II. In-Season Demand Shortfall

A. Considerations for the Selection of a Baseline Year

7. A BLY is a year or average of years when irrigation demand represents conditions that can predict need in the current year of irrigation at the start of the irrigation season. The purpose of predicting need is to estimate material injury.

8. A BLY is selected by analyzing three factors: (1) climate; (2) available water supply; and (3) irrigation practices. R. vol. 37, at 7098.[2] To capture current irrigation practices, identification of a BLY is limited to years subsequent to 1999. *Id*. at 7096.



9. The historic diversion volumes from the BLY and the predicted supply forecast at the start of the irrigation season are inputs to predict the initial IDS, where a demand shortfall is the difference after subtracting BD from the FS. When the difference is a positive number, the IDS is zero. When the difference is negative, the negative value equals the in-season demand shortfall. IDS increases with increases in BD, decreases in FS, or both. Assuming constant irrigation practices, crop distributions, and total irrigated acres, demand for irrigation water typically increases in years of higher temperature, higher reference evapotranspiration ("ET"), and lower precipitation. If water demand data is averaged for several years and these averages are the basis to predict demand shortfall at the start of the season, in a high-water demand year, these averages may often under-predict the demand shortfall. In a high-water demand year, under-prediction of IDS might be acceptable if the junior priority ground water right holders and the senior priority surface water right holders shared equally in the risk of water shortages. Equality in sharing the risk will not adequately protect the senior priority surface water right holder from injury. Actual demand shortfalls to a senior surface water right holder resulting from predictions at the start of the irrigation season based on average data unreasonably shifts the risk of shortage to the senior surface water right holder. Therefore, a BLY should represent a year(s) of above average diversions and should not represent a year(s) of average or below average diversions. An above average diversion year(s) selected as the BLY should also represent a year(s) of above average temperatures and reference ET, and below average precipitation to ensure that increased diversions were a function of crop water need and not other factors. In addition, actual supply should be analyzed to assure that the BLY is not a year of limited supply.

i. Climate

10. For the methods outlined herein, climate is represented by precipitation, reference ET, and growing degree days.

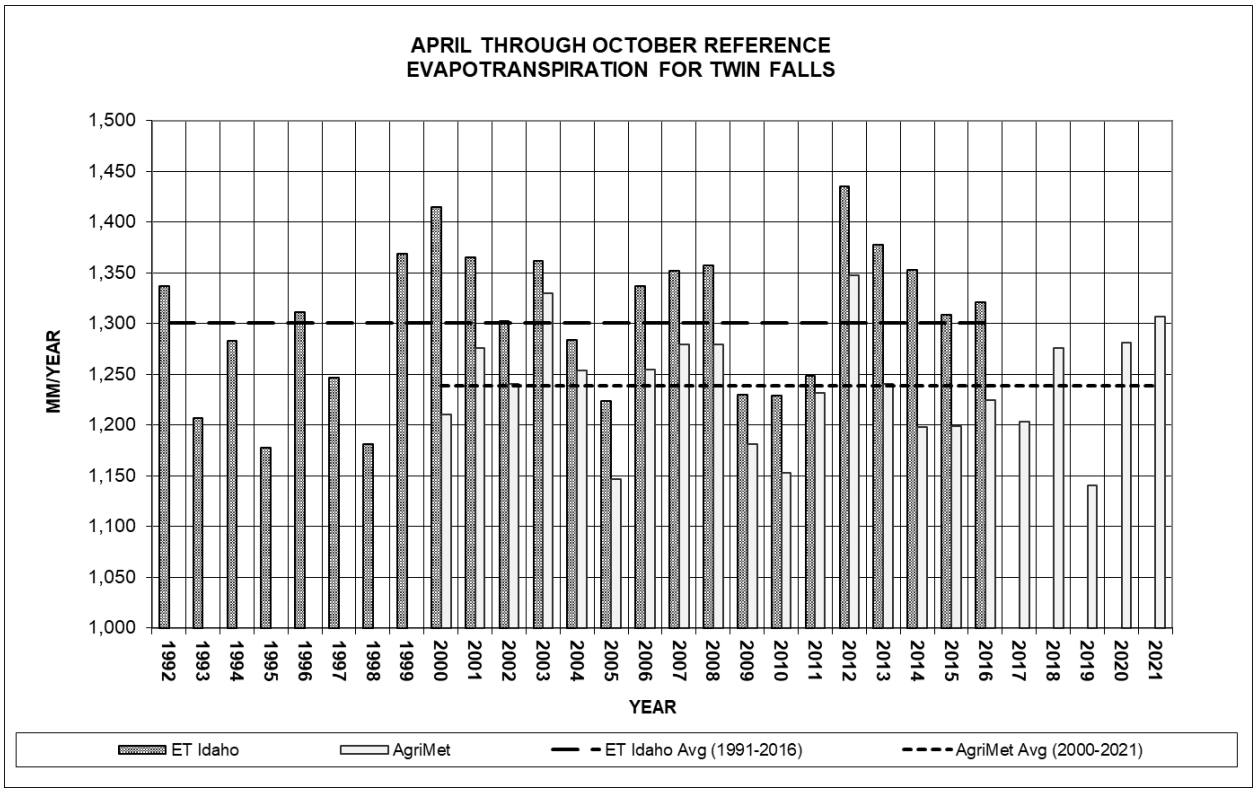
[2] All citations to "Ex", "Tr.", or "R. vol." in this Order are to material that was admitted during the original January 18–February 5, 2008 Hearing in the Matter of Distribution of Water to Various Water Rights Held by or for the Benefit of [the SWC] ("2008 Hearing") and is part of the final agency record on appeal in Gooding County Case No. CV-2008-551, which was lodged with the Fifth Judicial District Court on February 6, 2009.

11. Precipitation. Water, in all phases, introduced to Idaho from the atmosphere is termed precipitation. During the growing season, precipitation reduces the irrigation water needed for growing crops. Ex. 3024, at 19. The figure below shows the precipitation recorded during the growing season at the National Weather Service's Twin Falls weather station.

Growing Season Precipitation at National Weather Service's Twin Falls Weather Station 1992–2021.[3]

[3] The Fourth Methodology Order included data for the period 1990 through 2014. This Fifth Methodology Order updated this chart with data for the period 1992 to 2021. This Sixth Methodology Order relies on the same data included in the Fifth Methodology Order. The chart is created from NOAA National Weather Service total precipitation data obtained from the NCDC's Climatological Data Annual Summary Idaho report series for the Twin Falls 6 E and Twin Falls Sun Valley Regional Airport weather stations.

12. Evapotranspiration. ET is a variable representing both the amount of water that transpires from vegetation and the amount of water that evaporates from the underlying soil. ET is an important factor for properly estimating RISD. In its water budget calculations, the SWC proposed the use of ET values from the USBR as part of their Pacific Northwest Cooperative Agricultural Network, i.e., AgriMet. Ex. 8000, vol. II, ch. 9; Ex. 8000, vol. IV, app. AU. The ground water users proposed the use of ET values from Richard G. Allen and Clarence W. Robison 2007, Evapotranspiration and Consumptive Irrigation Water Requirements for Idaho, i.e., ETIdaho. Ex. 3007A, at 21; Ex. 3024, at 1–58.



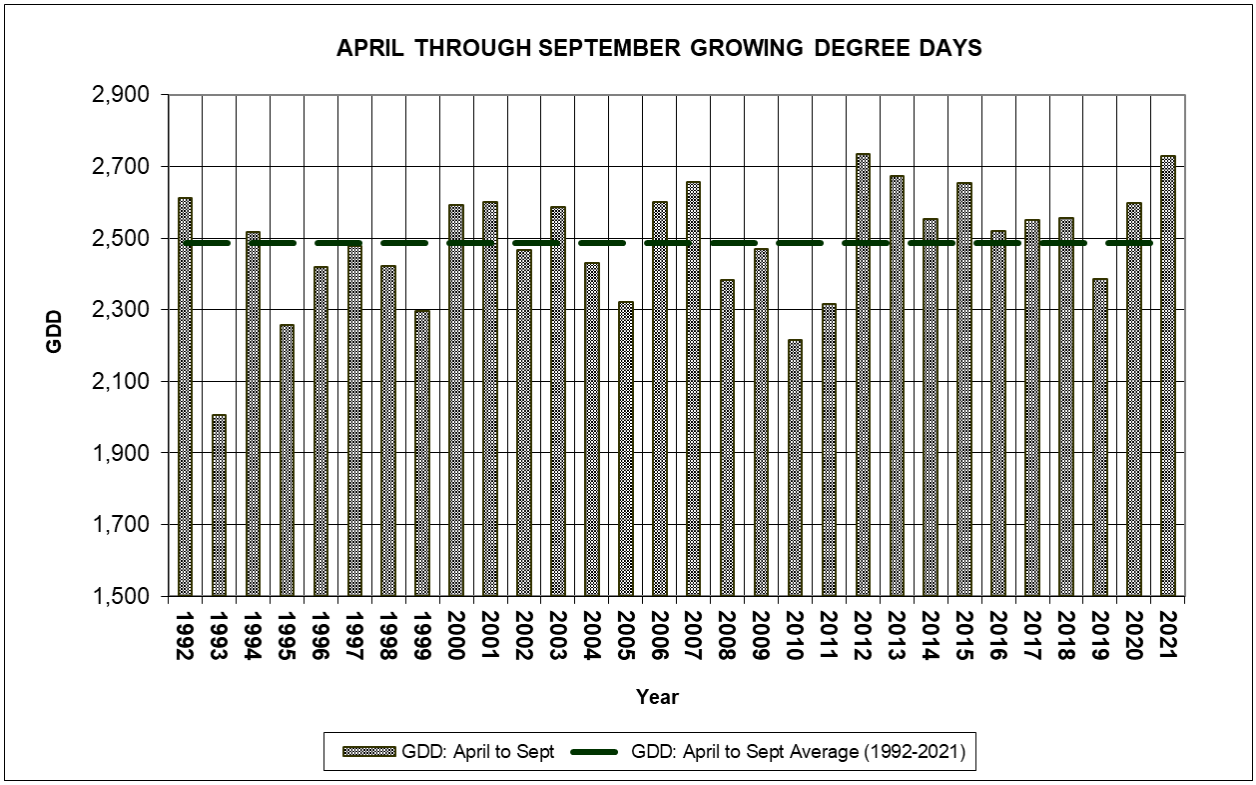
13. Reference ET is a standardized index that approximates the climatic demand for water vapor (i.e., ET). Both ETIdaho and AgriMet calculate and publish reference ET data. The Department will identify potential BLYs by consulting both ETIdaho reference ET and AgriMet reference ET.

14. Neither ETIdaho reference ET data nor AgriMet reference ET data span the entire period of analysis (1992–2021). ETIdaho reference ET data are currently available from 1990 through 2016.[4] AgriMet reference ET data are available from 2000 to 2021.[5] Ideal BLY candidates are years in which reference ET exceeds average reference ET values. Candidate baseline years are compared using both AgriMet and ETIdaho reference ET data for those years in which both data are available and only AgriMet data in those years where there is no ETIdaho data.

[4] The Fourth Methodology Order included ETIdaho reference ET data for the period 1991 to 2011. ETIdaho reference ET data is now available through 2016. The Fifth Methodology Order updated this chart with data for the period 1992 to 2016. This Sixth Methodology Order relies on the same data included in the Fifth Methodology Order.

[5] The Fourth Methodology Order included AgriMet reference ET data for the period 2000 to 2014. AgriMet reference ET data is now available through 2021. The Fifth Methodology Order updated this chart with data for the period 2000 to 2021. This Sixth Methodology Order relies on the same data included in the Fifth Methodology Order.

15. Years of above average values of reference ET are appropriate BLY candidates.[6] Total April through October reference ET for the period of record from the Twin Falls (Kimberly) AgriMet site is shown below.

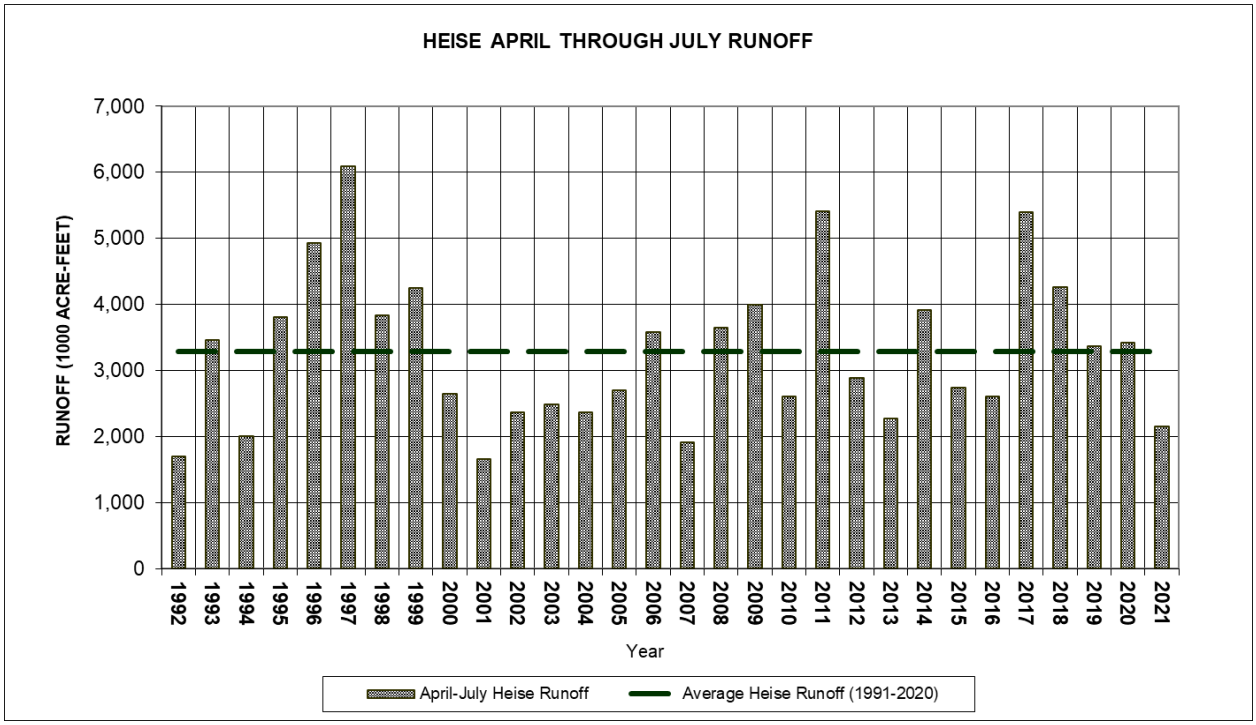


Reference ET for Twin Falls (Kimberly) with both AgriMet and ETIdaho data 1992–2021.[7]

[6] Values for reference ET between ETIdaho and AgriMet do not match because they are derived differently. The relevant information for identifying a potential BLY is the relationship between the year under consideration and the average for the data sets.

[7] The Fourth Methodology Order included data only through 2014. The Fifth Methodology Order updated this chart with combined data for the period 1992 to 2021, establishing a 30-year record which is the professional standard of practice for calculating climatic and hydrologic normals. This Sixth Methodology Order relies on the same data used in the Fifth Methodology Order.

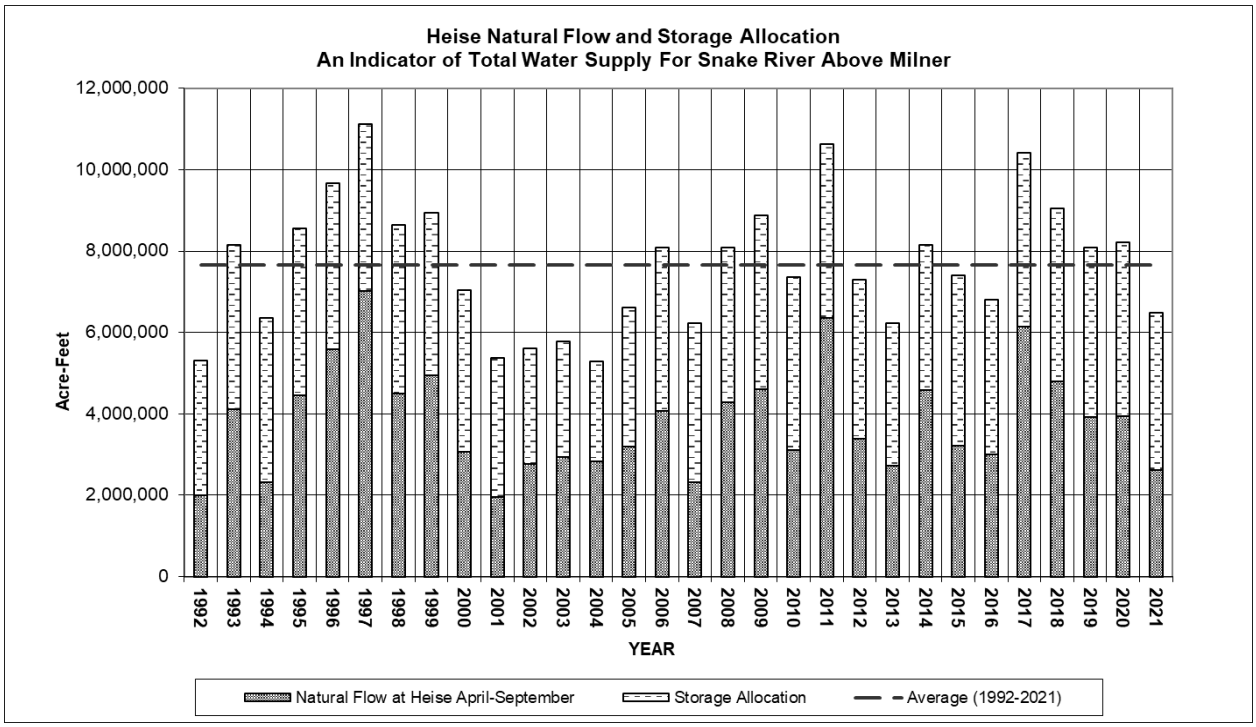
16. Growing Degree Days. Growing degree days define the length and type of growing season. Growing degree days are an arithmetic accumulation of daily mean temperature above a certain base temperature. Ex. 3024, at 10, 117–21. These growth units are a simple method of relating plant growth and development to air temperatures. Different plant species have different base temperatures below which they do not grow. At temperatures above this base, the amount of plant growth is approximately proportional to the amount of heat or temperature accumulated. A higher annual growing degree day value correlates to a higher potential rate of plant growth. The table below shows growing degree days accumulated for April through September for the Twin Falls (Kimberly) AgriMet site.



Growing Degree Days ("GDD") for Twin Falls (Kimberly) AgriMet Site 1992–2021.[8]

[8] The Fourth Methodology Order included data only through 2014. The Fifth Methodology Order updated this chart with data for the period 1992 to 2021. This Sixth Methodology Order relies on the same data included in the Fifth Methodology Order.

ii. Available Water Supply



17. The April through July Heise runoff volume represents the volume of water available for diversion into storage reservoirs and is an indicator of natural flow supplies. The graph below shows actual unregulated flow volumes at Heise for 1992 through 2021. The 1992 to 2021 average (3,284,000 acre-feet) is displayed by the dashed line.

April through July Unregulated Flow Volume at Heise, 1992–2021.[9]

[9] The Fourth Methodology Order included data only through 2014. The Fifth Methodology Order updated this chart with data for the period 1992 to 2021. This Sixth Methodology Order relies on the same data included in the Fifth Methodology Order.

18. The sum of the Heise natural flow and the reservoir storage allocations is an indicator of the total supply of the Snake River. The sum of the Heise natural flow and reservoir storage allocations for each year from 1992–2021 is represented in the graph below.

The sum of the Heise natural flow and the storage allocation for the Snake River above Milner 1992–2021.[10]

iii. Irrigation Practices

19. A baseline year ("BLY") must be recent enough to represent current irrigation practices. R. vol. 37, at 7099–7100. Current conditions should be represented by: (a) the net area of the irrigated crops, (b) farm application methods (flood/furrow or sprinkler irrigation), and (c) the conveyance system from the river to the farm. The type of sprinkler systems should be similar between the BLY and the current year.

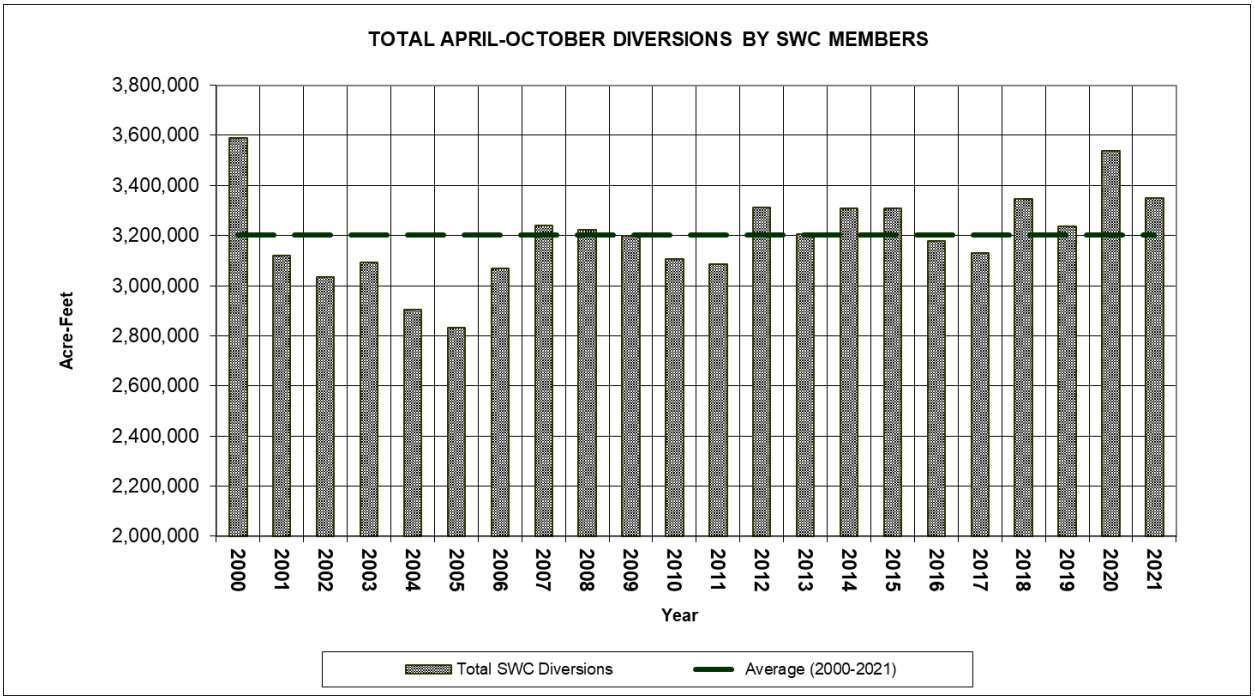
20. Sprinkler systems are currently the predominant application system. *Id*. at 7101–02. To ensure that current irrigation practices are captured, selection of a BLY for the SWC should be limited to years subsequent to 1999. *Id*. at 7096; 7099–7100.

[10] The Fourth Methodology Order included data for the period 1990 to 2014. The Fifth Methodology Order updated this chart with data for the period 1992 to 2021. This Sixth Methodology Order relies on the same data included in the Fifth Methodology Order.

21. According to the Hearing Officer at the 2008 Hearing, Gerald Schroeder ("Hearing Officer"), beneficial use cannot occur on acres that have been hardened or are otherwise not irrigated. R. vol. 37, at 7100.

22. The following table summarizes: a) SWC entities; b) shapefile source of reported irrigated acres; c) year shapefile created; d) decreed irrigated acres; (e) number of reported acres in shapefile; and f) irrigated acres used in this methodology order for the 2023 irrigation season. The number of irrigated acres used in this methodology order is the number of reported acres unless that number is larger than the decreed irrigated acres, and if so, then the decreed acres were used. This table will be updated annually based on the reported number of irrigated acres by each SWC entity in Step 1 of the Methodology Order.

Entity	Shapefile Source	Shapefile Year	Partial Decree Acres	Shapefile Acres	Acres Used in Methodology
A&B	PPU[1]	2010	15,924	21,972	15,924
AFRD2	PPU	2010	62,361	69,077	62,361
BID	SWC	2013	47,643	46,035	46,035
Milner	PPU	2010	13,335	13,264	13,264
Minidoka	SWC	2023	75,093	77,176	75,093
NSCC	PPU	2010	154,067	224,463	154,067
TFCC	SWC	2013	196,162	194,732	194,732



[1] IDWR permissible place of use.

Acres used in the methodology.

23. There are lands within the service areas of SWC entities that are irrigated with supplemental groundwater. Ex. 3007. Supplemental groundwater is a factor the Director can consider in the context of a delivery call. *Memorandum Decision and Order on Petitions for Judicial Review* ("Methodology Remand Order") in Gooding County Consolidated Case No. CV-2010-382, at 18–19. At this time, the information submitted or available to the Department is insufficient to determine the extent of supplemental irrigation on lands within the service areas of SWC entities.

iv. Diversions

24. The following figure summarizes the annual measured diversions by the combined SWC members from 2000–2021. Diversions for a baseline year should exceed the average diversions.

Total April–October Diversions by SWC Members.[11]

B. Selection of the Initial Baseline Year

25. When selecting the BLY, the Director must evaluate recent data to determine whether the BLY section criteria are satisfied.

26. In the Fourth Methodology Order, the Department considered the years 2000-2014 when deciding the BLY. Ultimately, the Department chose an average of the years 2006, 2008, and 2012 for the BLY ("BLY 06/08/12"). For this Sixth Methodology Order, the years 2000–2021 were considered for the BLY selection. With the addition of new data from 2014 to 2021, the total diversions by the SWC for the previous BLY 06/08/12 are 100% of the average SWC diversions for the years 2000–2021. As a result of adding the new data, BLY 06/08/12 no longer satisfies the presumption criteria that total diversions in the BLY should exceed the average annual diversions. Mem. Decision & Order on Pets. for Jud. Rev., at 34, *IGWA v. Idaho Dep't of Water Res.*, No. CV-2010-382 (Gooding Cnty. Dist. Ct. Idaho Sept. 26, 2014).

[11] The Fourth Methodology Order did not include this chart. It was added to the Fifth Methodology Order to demonstrate that the baseline year is a year of above average total diversions. As discussed in footnote 12, during the June 2023 Hearing the Department identified an error in AFRD#2's 2018 diversion data. Hr'g Tr. vol. IV, at 173–74. This correction was resolved in this Sixth Methodology Order, which relies on the updated data. The updated data did not result in an appreciable increase in 2018's diversion value.

27. Years 2018 and 2020 satisfy all the BLY selection criteria discussed above. Each of these years had (1) total diversions above the average diversions for the years 2000–2021, (2) total growing degree days above the average for the years 1992–2021, and (3) reference ET values above the average for the years 1992–2021. The years 2018 and 2020 also had total precipitation values below the average precipitation for the years 1992–2021 and were not water supply limited years. The Department has reviewed the SWC's diversion data for the 2020 irrigation season. The Department finds that 2020 ranks as the second-highest year of total diversions for the SWC and is more than one standard deviation above the average for the years 2000–2021. In comparison, 2018 ranks as the fourth-highest year of total diversions for the SWC and is less than one standard deviation above the average for the years 2000–2021. Choosing a BLY with above average diversions but within one standard deviation, ensures that a conservative year is selected that protects the senior while excluding extreme years from consideration. The Director concludes that total diversions for 2018 adequately protect senior water rights when predicting the demand shortfall at the start of the irrigation season and selects 2018 as the BLY.

Entity	2000–2021 Avg. Total Diversions (Acre-Feet)	06/08/12 Avg. Total Diversions (Acre-Feet)	06/08/12 % of Avg.	2018 Total Diversions (Acre-Feet)	2018 % of Avg.
A&B	59,474	59,993	101%	64,192	108%
AFRD2	427,978	427,672	100%	458,890	106%
BID	247,049	251,531	102%	262,211	106%
Milner	53,343	47,135	88%	58,417	110%
Minidoka	354,181	369,492	104%	354,851	100%
NSCC	996,267	978,888	98%	1,026,661	103%
TFCC	1,062,098	1,060,011	100%	1,121,717	106%
Total	3,200,617	3,194,722	100%	3,346,939	105%

Average SWC Diversions (acre-feet) for 2000–2021, 2006/2008/2012 BLY, and 2018 BLY.[12]

C. Calculation of Reasonable In-Season Demand

28. Prior to the irrigation season, reasonable in-season demand ("RISD") is the projected annual diversion volume for each SWC entity during the year of evaluation that is attributable to the projected beneficial use of growing crops within the service area of the entity. Given that climate and system operations for the year being evaluated will likely be different from the BLY, the RISD must be adjusted for those differences. As stated by the Hearing Officer, "The concept of a baseline is that it is adjustable as weather conditions or practices

[12] In this Sixth Methodology Order, AFRD2's 2018 diversion value has been increased by 5,000 acre-feet. This increase was necessary to remedy the error committed by Department staff in calculating AFRD2's 2018 adjusted diversion value for the Fifth Methodology Order, which was identified during the June 6 Hearing. Hr'g Tr. vol. IV, at 173–74. The error is minor, accounting for approximately 1% of AFRD2's 2018 diversions. The Director concludes that the error had no appreciable impact on any calculations in the Fifth Methodology Order that relied on AFRD2's 2018 diversion volume.

change, and that those adjustments will occur in an orderly, understood protocol." R. vol. 37, at 7098.

i. Project Efficiency

29. Project efficiency ("E_p") is the ratio of total volumetric crop water needs within a SWC entity's boundary and the total volume of water diverted by that entity to satisfy its crop needs. It is the same concept as system efficiency, which was presented at the 2008 Hearing. Ex. 3007, at 28–29. Implicit in this relationship are the components of seepage loss (conveyance loss), on-farm application losses (deep percolation, field runoff), and system operational losses (return flows) for which data is not obtainable by the Department. By utilizing project efficiency and its input parameters of crop water need and total diversions, the influence of the unknown components for which data is not obtainable can be captured and described without quantifying each of the components. Project efficiency is derived by dividing crop water need by total diversions as depicted in the algorithm below:

$$E_p = \frac{CWN}{Q_D}$$

Where:

E_p = project efficiency,
CWN = crop water need, and
Q_D = irrigation entity diversion of water specifically put to beneficial use for the growing of crops within the irrigation entity.

30. Monthly SWC entity diversions ("Q_D") will be obtained from Water District 01's diversion records. Ex. 8000, vol. II, at 8-4, 8-5. Raw monthly diversion values will then be adjusted to remove any water diversions that can be identified to not directly support the beneficial use of crop development within the irrigation entity. Examples of adjustments include the removal of diversions associated with in-season recharge and diversion of irrigation water on the behalf of another irrigation entity. Adjustments are unique to each SWC member and each irrigation season and will be evaluated each year. Any natural flow or storage water deliveries to entities other than the SWC for purposes unrelated to the original right will not be included as a part of the SWC water supply or carryover volume. Water that is purchased or leased by a SWC member may become part of the shortfall obligation to the extent that member has been found to have been materially injured. *See e.g.,* R. vol. 38, at 7201 n.11 (Eighth Supplemental Order). Conversely, water supplied to private leases or to the rental pool by a SWC member will be included as a part of the SWC supply for that member because non-inclusion would unjustifiably increase the shortfall obligation.

31. Monthly project efficiencies will be computed for the entire irrigation season. Project efficiency varies from month-to-month during the season and will typically be lower during the beginning and ending of the season. Monthly project efficiencies will be divided into actual monthly crop water need ("CWN") values to determine RISD during the year of evaluation.

32. In the Fourth Methodology Order, project efficiencies for each SWC member were initially averaged over an eight-year period (2007–2014) and project efficiency greater or less than two standard deviations were excluded from the calculation. By including only those values within two standard deviations, extreme values from the data set are removed. Under the Fourth Methodology Order, an updated 8-year rolling average of project efficiencies was calculated each year the methodology was implemented. The Director now finds that averaging over a rolling period of 15 years results in project efficiency values that are more consistent from year-to-year, reducing the impact of short-term trends. The Director finds that it is still appropriate to remove project efficiencies greater or less than two standard deviations from the average.

The following is a table of efficiency values averaged over the most recent fifteen-year period of record.

Month	A&B	AFRD2	BID	Milner	Minidoka	NSCC	TFCC	Monthly Avg.
4	0.98	0.33	0.45	0.87	0.43	0.24	0.31	0.51
5	0.47	0.22	0.32	0.39	0.35	0.24	0.30	0.33
6	0.66	0.40	0.49	0.60	0.56	0.41	0.51	0.52
7	0.74	0.44	0.52	0.67	0.63	0.48	0.58	0.58
8	0.58	0.41	0.42	0.55	0.52	0.43	0.46	0.48
9	0.45	0.27	0.32	0.45	0.38	0.32	0.27	0.35
10	0.18	0.16	0.09	0.14	0.11	0.06	0.04	0.11
Season Avg.	0.58	0.32	0.37	0.52	0.43	0.31	0.35	

SWC Member Average Monthly Project Efficiencies from 2007–2021.[13]

ii. Crop Water Need

33. CWN is the volume of irrigation water required for crop growth within a SWC entity boundary, such that crop growth is not limited by water availability. CWN only applies to crops irrigated with surface water. CWN is the difference between the fully realizable consumptive use associated with crop growth, or ET, and effective precipitation (W_e) and is synonymous with the terms irrigation water requirement and precipitation deficit. Ex. 3024. For the purposes of the methodology, CWN is calculated as set forth below:

$$CWN = \sum_{i=1}^{n} (ET_i - W_e) A_i$$

[13] In the Fourth Methodology Order, this table summarized average E_p data for the period 2007 to 2014. The Fifth Methodology Order updated this table with average E_p data for the period 2007 to 2021. This Sixth Methodology Order relies on the same data included in the Fifth Methodology Order.

Where:

CWN = crop water need
ET_i = consumptive use of specific crop type,
W_e = effective precipitation,
A_i = total irrigated area of specific crop type,
i = index variable representing the different specific crop types grown within the irrigation entity, and
n = upper bound of summation equal to the total number of different specific crop types grown within the irrigation entity.

iii. Evapotranspiration

34. ET can be estimated with theoretically based equations that calculate ET for an individual crop, necessitating crop distribution maps for each year. Ex. 3007A, at 21, fig. 3, tbls. 6–12; Ex. 3024, at 1–58; Ex. 8000, vol. II, ch. 9; Ex. 8000, vol. IV, app. AU.

35. At the 2008 Hearing, values of ET were estimated by the SWC from AgriMet, Ex. 8000, vol. IV, at AU-1, and by the ground water users from ETIdaho, Ex. 3007A, at 21; Ex. 3024, at 1–58. At this time, the Director finds that the use of AgriMet is more appropriate for determining ET than ETIdaho because AgriMet is available to all parties in real-time without the need for advanced programming. Accordingly, the methodology will rely on AgriMet derived ET values in the calculations of project efficiency, CWN, and RISD. In the future, with the development of additional enhancements, ETIdaho may become a more appropriate analytical tool for determining ET.[14]

36. CWN is derived by multiplying crop specific ET values, adjusted for estimated effective precipitation, by the total irrigated area of individual crop types, and summing the CWN for each crop type. The areas for individual crop types will be derived from published crop distributions from the United States Department of Agriculture's National Agricultural Statistics Service ("NASS"). Ex. 1005, at 1. NASS annually creates a crop-specific land cover digital dataset from satellite imagery and field checks. The dataset is called the Cropland Data Layer ("CDL"). Each year, the Department will calculate acreage by crop type for each SWC entity using NASS CDL data. In the future, the NASS data may not be the most accurate source of data. The Department prefers to rely on data from the current season if and when it becomes usable.

37. AgriMet ET and precipitation data are gathered at the Rupert and Twin Falls (Kimberly) stations. Both stations are in the vicinity of the SWC entities. A&B Irrigation District ("A&B"), Burley Irrigation District ("BID"), and Minidoka Irrigation District ("Minidoka") are nearest to the Rupert AgriMet station. ET data gathered at the Rupert station reasonably represents the climate conditions for A&B, BID, and Minidoka. American Falls Reservoir District No. 2 ("AFRD2"), Milner Irrigation District ("Milner"), North Side Canal

[14] IDWR held a series of meetings in the winter of 2022–23 with the parties' technical consultants to discuss potential updates to the methodology order. During the meetings, IDWR discussed alternative methods of determining ET values, such as METRIC. However, the Director finds that the methods considered are not yet ready for incorporation into the administration of the SWC Delivery Call and will continue to rely on AgriMet ET data.

Company ("NSCC"), and Twin Falls Canal Company ("TFCC") are nearest to the Twin Falls (Kimberly) AgriMet station. ET data gathered at the Twin Falls (Kimberly) station reasonably represents the climate conditions for AFRD2, Milner, NSCC, and TFCC. Ex. 8000, vol. IV, at AU-2, AU-8.

iv. Effective Precipitation

38. Effective precipitation ("W_e") is the amount of total precipitation held in the soil horizon available for crop root uptake. Effective precipitation will be estimated from total precipitation (W) employing the methodology presented in the USDA Technical Bulletin 1275. Ex. 8000, vol. IV, at AU-3, AU-8. Total precipitation (W) data is published by the USBR as part of its Pacific Northwest Cooperative Agricultural Network, i.e., AgriMet.[15] Ex. 8000, vol. IV, at AU-3. W_e values derived from AgriMet based precipitation values are independent of crop type.

39. AgriMet precipitation (W) values are easy to understand and regularly used by the farming, water supply, and water management communities. Accordingly, the methodology will rely on AgriMet derived W values in the calculations of CWN and RISD.

40. As with ET data, AgriMet precipitation data are available from the Rupert and Twin Falls (Kimberly) stations. AgriMet data from the Rupert station reasonably represents climate conditions for A&B, BID, and Minidoka. AgriMet data from Twin Falls (Kimberly) reasonably represents climate conditions for AFRD2, Milner, NSCC, and TFCC. Ex. 8000, vol. IV, at AU-2, AU-8.

v. Summary of Reasonable In-Season Demand Calculation

41. At the start of the irrigation season, RISD is equal to the BD, or total season adjusted diversions for the BLY. When calculated in-season, RISD is calculated below.

$$RISD_{milestonex_x} = \sum_{j=1}^{m}\left(\frac{CWN_j}{E_{p,j}}\right) + \sum_{j=m+1}^{7} BD_j$$

Where:

$RISD_{milestone_x}$ = reasonable in season demand at specified evaluation milestones during the irrigation season,
CWN = crop water need for month j,
E_p = baseline project efficiency for month j,
BD = baseline demand for month j,
j = index variable, and
m = upper bound of summation, equal to the month calculation occurs, where April = 1, May =2, … October = 7.

[15] IDWR held a series of meetings in the winter of 2022–23 with the parties' technical consultants to discuss potential updates to the methodology order. During the meeting, IDWR discussed alternative methods to determine W values, such as PRISM. However, the Director finds that the methods considered are not yet ready for incorporation into the administration of the SWC Delivery Call and will continue to rely on AgriMet precipitation data.

42. April RISD Adjustment: In April, the calculated RISD, which is the quotient of CWN and Ep, can underestimate actual canal operation diversions. Under-estimation occurs when the actual CWN value for April is much smaller than the diversion of water into the canal system necessary to effectively operate the irrigation delivery system. Often, CWN in April is small due to precipitation, cool temperatures, and/or the immaturity of the crop. The diversion rate at the head gate necessary to push water into all laterals and field head gates throughout the delivery system often dwarfs the water necessary to strictly satisfy CWN. In addition, it is difficult for canal systems to be dynamically operated to match the frequent precipitation events in April, which also contributes to a diversion of water at the canal head gate that exceeds the diversion of water necessary to strictly satisfy CWN. To account for the conditions affecting the usability of the calculated RISD value for April, the values may be adjusted for each individual irrigation delivery entity in the SWC as described below.

43. When the calculation of CWN/Ep results in a value for the month of April less than the average April diversion volume over a record of representative years in the recent past, the April RISD is set equal to the average April diversion volume. When the calculation of CWN/Ep results in a value greater than the average April diversion volume, the April RISD is equal to the calculated CWN/Ep volume.

44. October RISD Adjustment: In October, the calculated RISD, which is equal to the CWN divided by Ep, can both under-estimate and over-estimate actual canal operation diversions. The RISD may be underestimated when the actual CWN value for October is much smaller than the diversion of water into the canal system necessary to effectively operate the irrigation delivery system. The diversion rate at the head gate necessary to push water into all laterals and field head gates throughout the delivery system often dwarfs the water necessary to strictly satisfy CWN. In addition, it is difficult for canal systems to be dynamically operated to match the frequent precipitation events in October, which also contributes to a diversion of water at the canal head gate that exceeds the diversion of water necessary to strictly satisfy CWN. Furthermore, RISD may be underestimated in October when a farmer diverts water at the field head gate for farming practices other than strictly satisfying CWN. Examples of water diversion practices at the field head gate that sometimes occur in October include diverting water for soil salt leaching, diverting water to build up the soil moisture profile for the following irrigation season, and/or diverting water to wet-up bare soil to prevent wind-driven topsoil erosion.

45. Unlike the month of April, RISD can be over-estimated in October. RISD may be over-estimated in years when actual CWN in October is much greater than typical CWN over a record of representative years in the recent past due to low precipitation and/or warm temperatures. To account for the conditions affecting the usability of the RISD value calculated for October, the values may be adjusted for each individual irrigation delivery entity in the SWC as described below.

46. When the calculation of CWN/Ep results in a value for the month of October greater than the maximum October diversion volume from a record of recent representative years, or less than the minimum October diversion volume from the same record of recent representative years, the October RISD is set equal to the average October diversion volume over

the same period of recent representative years. When the calculation of CWN/Ep results in a value between the maximum and minimum October diversion volumes from a record of recent representative years, the October RISD is equal to the calculated CWN/Ep volume.

D. Adjustment of Forecast Supply

47. As stated by the Hearing Officer, "There must be adjustments as conditions develop if any baseline supply concept is to be used." R. vol. 37, at 7093. A prediction of the upcoming season's supply and demand is calculated at the beginning of the irrigation season and adjusted at specified milestones during the irrigation season to address changes in water supply and demand conditions in response to actual climatic and water supply conditions.

i. April Forecast Supply

48. The FS is comprised of natural flow and stored water.

49. Typically, within the first week of April, the USBR and the USACE issue their Joint Forecast that predicts an unregulated inflow volume at the Heise Gage from April 1 to July 31 for the forthcoming year. The joint forecast ("Joint Forecast") issued by the United States Bureau of Reclamation ("USBR") and the United States Army Corp of Engineers ("USACE") for the period April 1 through July 31 "is generally as accurate a forecast as is possible using current data gathering and forecasting techniques." R. vol. 8, ¶ 98, at 1379. Given current forecasting techniques, the earliest the Director can predict material injury "with reasonable certainty" is soon after the Joint Forecast is issued. R. vol. 2, at 226. With data from 1990 through the irrigation year previous to the current year, a regression equation will be developed for each SWC member.[16] The regression equations for A&B and Milner will be developed by comparing the actual Heise natural flow to the natural flow diverted. *See e.g.,* R. vol. 8, at 1416–22. For AFRD2, BID, Minidoka, NSCC, and TFCC, multi-linear regression equations will be developed by comparing the actual Snake River near Heise natural flow and the flows at Box Canyon to the natural flow diverted. The regression equations will be used to predict the natural flow diverted for the upcoming irrigation season. *Id*. at 1380. The actual natural flow volume predicted in the Director's April FS for each SWC entity will be one standard error below the regression line, which underestimates the available supply. *Id*.; Tr., at. 65:6–25, 66:1–2. The purpose of the shift to one standard error below the regression line is to ensure senior water right holders do not bear the risk of under-prediction of supply. The forecasting techniques will be revised based on updated data and the forecasting techniques may be revised when improvements to the forecasting tools occur.

50. The storage allocation for each member of the SWC will be estimated by the Department following issuance of the Joint Forecast. The Department will forecast reservoir fill and storage allocation consistent with the methods established in the *Fifth Supplemental Order Amending Replacement Water Requirements Final 2006 & Estimated 2007.* R. vol. 23, at 4294–

[16] IDWR held a series of meetings in the winter of 2022–23 with the parties' technical consultants to discuss potential updates to the methodology order. During the meetings, IDWR discussed updating the regression models used to forecast the SWC's water supplies in April. However, the Director finds that the current models still adequately forecast water supplies in April and will continue to rely on the existing regression models.

97 as explained below. The Department will evaluate the current reservoir conditions and the current water supply outlook to determine a historical analogous year or years to predict reservoir fill. The Department may identify and use a combination of different analogous years to predict individual reservoir fill. Input variables for determining the individual storage water allocation for each SWC member are: (a) the analogous year's or years' total reservoir fill volume; (b) an estimated evaporation volume; and (c) the previous year's carryover volume. The FS (the combination of the forecast of natural flow supply and the storage allocation) for each SWC member will be determined by the Director shortly after the date of the Joint Forecast.

51. Any time prior to the Director's final determination of the April FS, if the Director can determine with certainty that any member of the SWC has diverted more natural flow than predicted, or has accrued more storage than predicted, the Director will revise his initial, projected shortfall determination.

ii. July Forecast Supply

52. Approximately halfway through the irrigation season, the FS will be adjusted. When adjusting the natural flow component of the FS, the Department's water rights accounting program will compute the year-to-date natural flow diverted by each member of the SWC. The natural flow diversion for the remainder of the irrigation season will be estimated based on the regression analyses.

53. The natural flow supplies for each SWC member are comprised of natural flow in the Snake River passing the near Blackfoot gage and gains that occur in the Snake River between the Blackfoot to Milner reach. Many different predictor variables were considered when developing the models used to predict the natural flow supplies for the remainder of the season, including those variables used in the April FS.[17] A step-wise statistical analysis was employed to help select the variables for each model. The following variables were selected to forecast water supplies halfway through the irrigation season: natural flow in the Snake River near Heise as reported by the U.S. Bureau of Reclamation; snow water equivalent (SWE) data at the Two Ocean Plateau SNOTEL site; Spring Creek discharge; and groundwater levels near American Falls Reservoir. The model predictors were optimized for each SWC member and are summarized in the sections below.

54. Linear regression equations for AFRD2, A&B, and Milner, will be developed by comparing the July 1 snow water equivalent (inches) at the Two Ocean Plateau SNOTEL site to the natural flow diversions. The regression equations for AFRD2, A&B, and Milner will be applied only in those years when the snow water equivalent at the Two Ocean Plateau SNOTEL site is greater than zero (0). Years when the snow water equivalent equals zero, the total natural flow prediction for the period July 1 to October 31 will be zero (0) AF.

[17] IDWR held a series of meetings in the winter of 2022–23 with the parties' technical consultants to discuss potential updates to the methodology order. IDWR discussed updating the regression models used to forecast the SWC's water supplies in July. However, the Director finds that the current models still adequately forecast water supplies in July and will continue to rely on the existing regression models.

55. Multiple linear regression equations for BID, Minidoka, and NSCC will be developed to predict natural flow diversions employing the following predictor variables: (1) Snake River near Heise natural flow (April – June), (2) March depth to water at well 05S 31E 27ABA1 and (3) the snow water equivalent at the Two Ocean Plateau SNOTEL site on June 15.

56. The multiple linear regression model for TFCC will be based on the following predictor variables: (1) Snake River near Heise natural flow (April – June), (2) Spring Creek total discharge (January – May) and (3) the snow water equivalent at the Two Ocean Plateau SNOTEL site on June 15.

57. When adjusting the storage component of the FS, the Department must consider whether stored water has been allocated. In normal to dry years, the reservoirs will typically have filled to their peak capacity for the season and the storage water will have been allocated. If the BOR and Water District 01 have allocated stored water to spaceholders, the Department will use the actual preliminary storage allocations to the SWC. If the BOR and Water District 01 have not yet allocated stored water to spaceholders, the Department will predict the storage allocations based on the storage allocations from an analogous year or years.

iii. Time of Need

58. The FS will again be adjusted shortly before the Time of Need. The Time of Need is established by predicting the day in which the remaining storage allocation will be equal to reasonable carryover. The Time of Need will not be earlier than the Day of Allocation.

59. When adjusting the natural flow component of the FS, the Department's water rights accounting program will compute the natural flow diverted by each member of the SWC as of the new forecast date. The natural flow diversion for the remainder of the irrigation season will be estimated based on a historical year with similar reach gains in the Blackfoot to Milner reach. The following is an example of estimating reach gains from an analysis of historical years. Reach gains for the years 2000 – 2003 and a portion of year 2004 are graphed below. Considering 2004 as an example of a current year and comparing 2004 to the hydrographs for 2000 – 2003, year 2003 has similar reach gains and is appropriately conservative. Therefore, the natural flow diverted in 2003 would be used to predict the natural flow diversions for the remainder of the 2004 season.

Example Reach Gain Analysis for 2004.

60. When adjusting the storage component of the FS, the Department will use the actual preliminary storage allocations to the SWC.

61. The adjusted FS is the sum of the year-to-date natural flow diversions, the predicted natural flow diversions for the remainder of the season, and the storage allocation.

E. Calculation of In-Season Demand Shortfall

62. The equation below determines the amount of predicted demand shortfall during the irrigation season.

$$IDS = FS - RISD$$

Where:

IDS = demand shortfall for specified evaluation points throughout the season,
FS = forecasted supply adjusted for specified evaluation point during the season, and
RISD = reasonable in-season demand from above.

63. The amount calculated represents the volume that junior ground water users with approved mitigation plans for delivery of water will be required to have available for delivery to members of the SWC found to be materially injured by the Director to avoid curtailment. The amounts will be calculated in April, at the middle of the season, and at the Time of Need.

III. Methodology for Determining Material Injury to Reasonable Carryover

64. Conjunctive Management ("CM") Rule 42.01.g states the following guidance for determining reasonable carryover: "In determining a reasonable amount of carry-over storage water, the Director shall consider average annual rate of fill of storage reservoirs and the average annual carry-over for prior comparable water conditions and the projected water supply for the system." Carryover shortfall will be determined following the completion of the irrigation season.

A. Projected Water Supply

65. CM Rule 42.01.g states that the Director "shall consider . . . the projected water supply for the system." Because it is not possible to adequately forecast the irrigation supply or demand for the following irrigation season at the end of the current irrigation season, the Director must estimate the carryover water needed in future dry years when demand exceeds supply, creating a need for carryover storage. The Director projected the water supply using typical dry years and subtracted it from a projected future demand to determine a projected carryover need.

66. The Heise natural flow is a predictive indicator of total water supply. For the years 2002 and 2004, the Heise natural flows were well below the long term average (1992–2021), but were not the lowest years on record.[18] The average of the 2002 and 2004 supply will be the projected supply, representing a typical dry year. The 2002 and 2004 supply is computed as follows:

- 2002 supply = natural flow diverted + new storage fill
- 2004 supply = natural flow diverted + new storage fill
- Projected supply = average of 2002 supply and 2004 supply

Carryover from previous years is not included in the 2002 and 2004 new storage fill because it was not new water supplied during the 2002 or 2004 irrigation year.

	2002 Natural Flow Diverted	2002 New Storage Fill	2002 Total Supply	2004 Natural Flow Diverted	2004 New Storage Fill	2004 Total Supply	Projected Supply (Average 02/04)
	----------Acre-Feet----------						
A&B	853	45,603	46,456	1	36,535	36,536	41,496
AFRD2	25,749	381,451	407,200	4,562	309,698	314,260	360,730
BID	89,886	174,454	264,340	102,706	152,387	255,093	259,716
Milner	5,058	43,430	48,488	1,027	35,175	36,202	42,345
Minidoka	143,937	256,602	400,539	141,460	229,574	371,034	385,787
NSCC	363,960	667,799	1,031,759	315,942	479,068	795,010	913,385
TFCC	851,970	186,233	1,038,203	881,345	150,218	1,031,563	1,034,883

SWC water supplies 2002, 2004, and 2002/2004 average (acre-feet).

67. Similar to projecting supply, the Director must also project demand. Because it is not possible to adequately forecast the irrigation demand for the following irrigation season at the end of the current irrigation season, the Director must project demand. R. vol. 37, at 7109. The 2018 BLY will be the projected demand.

[18] The Fourth Methodology Order included data for the period 1991 to 2014. The Fifth Methodology Order updated this chart with data for the period 1992 to 2021. This Sixth Methodology Order relies on the same data included in the Fifth Methodology Order.

68. The maximum projected carryover need is defined as the difference between a BLY demand and projected typical dry year supply. The following equation computes the maximum projected carryover need:

Maximum Projected Carryover Need = Projected Demand (2018 BLY) – Projected Supply (Average 02/04)

	Projected Demand (2018 BLY)	Projected Supply (average 02/04)	Maximum Projected Carryover Need
	----------Acre-Feet----------		
A&B	64,192	41,496	22,696
AFRD2	458,890	360,730	98,160
BID	262,211	259,716	2,495
Milner	58,417	42,345	16,072
Minidoka	354,851	385,787	0
NSCC	1,026,661	913,385	113,277
TFCC	1,121,717	1,034,883	86,834

SWC Projected Demand, Projected Supply and Maximum Projected Carryover Need (acre-feet).[19]

B. Average Annual Rate of Fill

69. CM Rule 42.01.g states that the Director "shall consider the average annual rate of fill of storage reservoirs . . . ." The average annual rate of fill of the storage reservoirs is the average of annual percentages of fill of each entity's reservoir space. The average annual reservoir storage fill is a benchmark that can be compared to projected carryover need. For purposes of the table below, any water contributed to the rental pool from the previous year was added to the next year's fill volume so that it does not artificially lower the percent fill. R. vol. 37, at 7108. Water that is supplied to the rental pool lowers carryover and could impact the following year's fill. The percent fill does not include water deducted for reservoir evaporation.

[19] The Fifth Methodology Order updated this chart with the new baseline year and calculated new maximum projected carryover need values. This Sixth Methodology Order relies on the same data included and calculated in the Fifth Methodology Order with one exception. As described in footnote 12, AFRD2's 2018 diversion value has been increased by 5,000 acre-feet to remedy an error committed by Department staff in calculating AFRD2's 2018 adjusted diversion value for the Fifth Methodology Order. Hr'g Tr. vol. IV, at 173–74.

The annual percent fill of storage volume by SWC entity is shown below:

Year	A&B	AFRD2	BID	Milner	Minidoka	NSCC	TFCC
1992	96%	100%	98%	93%	75%	76%	86%

Annual Percent Fill of Storage Volume by Entity (1992–2021).[20]

[20] The Fourth Methodology Order included data from 1995 through 2014. The Fifth Methodology Order updated this chart with data from 1992 through 2021. The Sixth Methodology Order relies on the same data included in the Fifth Methodology Order.

C. Average Annual Carryover

70. CM Rule 42.01.g states that the Director "shall consider the . . . average annual carry-over for prior comparable water conditions . . . ." Actual carryover volumes are from annual storage reports published by Water District 1. Actual carryover from 1992 through 2021 are sorted into two categories – below average (dry) and above average (wet). The categories are based on Heise natural flow volumes from April through September.

The 1992 to 2021 average natural flow volume is 3,827 thousand acre-feet ("KAF").

Cat.	Year	Heise Apr–Sept (KAF)	A&B	AFRD2	BID	Milner	MID	NSCC	TFCC
			----------	----------	----------	Acre-Feet	----------	----------	----------
	2001	1,968	9,902	4,217	37,430	26,854	55,132	42,421	26,917
	1992	2,001	11,966	11,548	31,977	28,896	16,928	19,439	3,590

Actual Carryover Volumes by Entity, Sorted by Heise Natural Flow (1992–2021).[21]

[21] In the Fourth Methodology Order, this table summarized data for the period 1994 to 2014 and adjusted WD 01 carryover values to remove water received for mitigation or water rented by the SWC entity to augment their supplies. The Fifth Methodology Order updated this chart with data for the period 1992 to 2021 and used raw carryover values reported by WD 01. Raw numbers were used because adjusted numbers reduced the SWC's

71. In considering the principles articulated in CM Rule 42.01.g, the Director will project reasonable carryover shortfalls for members of the SWC. The following table represents the 2018 BLY diversion volumes and total reservoir storage space by entity. By dividing the total reservoir space by the 2018 diversion volume, a metric is established that describes the total number of seasons the entity's reservoir space can supply water.

	A&B	AFRD2	BID	Milner	Minidoka	NSCC	TFCC
	----------Acre-Feet----------						
Projected Demand (2018 BLY)	64,192	458,890	262,211	58,417	354,851	1,026,661	1,121,717
Total Reservoir Space	137,626	393,550	226,487	90,591	366,554	859,898	245,930
Number of Seasons of Reservoir Space	2.1	0.9	0.9	1.6	1.0	0.8	0.2

Total Reservoir Space[22] in Comparison to Demand.[23]

D. Reasonable Carryover

i. A&B

72. A&B's reservoir space has the lowest average annual rate of fill with the highest variability in fill. *See* Finding of Fact 69. In dry years, the potential exists that A&B's actual carryover will be less than the maximum projected carryover need. *See* Finding of Fact 68, 70. A&B has an approximate two-year water supply provided by its total available storage space. *See* Finding of Fact 71. Because of its lower rate of fill, it is likely A&B will experience carryover shortfalls in consecutive dry years. Based on the evaluation criteria in CM Rule 42.01.g, A&B's reasonable carryover should be the maximum projected carryover need of 22,700 AF. *See* Finding of Fact 78.

ii. AFRD2

73. AFRD2 has the highest and most consistent reservoir rate of fill of any member of the SWC. AFRD2's storage space fills 99% of the time and has a fill variability of 3%. As

potential entitlement to reasonable carryover. This Sixth Methodology Order relies on the same data included in the Fifth Methodology Order.

[22] *See* R. vol. 8, at 1373–74.

[23] This Fifth Methodology Order updated this chart with a new baseline year and calculated a new number of seasons of reservoir space values. This Sixth Methodology Order relies on the same data included and calculated in the Fifth Methodology Order with the single exception discussed in footnote 12.

shown in the Annual Percent Fill table in Finding of Fact 69 above, its space only failed to fill in 2004 (82%) and 2000 (99%). AFRD2 has a high likelihood of filling during multi-year droughts and after a dry year. *See* Finding of Fact 69. Therefore, any unfilled space in the fall will most likely fill. AFRD2 has an approximate one-year supply available in storage. *See* Finding of Fact 71. AFRD2's storage space only failed to fill in years when the natural flow volume at Heise was less than 3,100 KAF. In a dry year, AFRD2's historical carryover volume is often less than the maximum projected carryover need using the equation set forth in Finding of Fact 68 and 70. Based on the evaluation criteria for reasonable carryover in CM Rule 42.01.g, the reasonable carryover can be adjusted from the maximum projected carryover need without shifting the risk of shortage to the senior right holder. The historical average carryover of 16,700 AF in years when the natural flow volume at Heise was less than 3,100 KAF is the reasonable carryover for AFRD2. *See* Finding of Fact 78.

iii. BID & Minidoka

74. Historically, in dry years, BID's and Minidoka's carryover volumes have been well above the maximum projected carryover need and it is unlikely that they will have reasonable carryover shortfalls in the future. *See* Finding of Fact 68, 70; *see also* R. vol. 37, at 7105. Based on the evaluation criteria for reasonable carryover in CM Rule 42.01.g, the reasonable carryover can be adjusted downward from the maximum projected carryover need without shifting the risk of shortage to the senior right holder. The reasonable carryover for BID and Minidoka is 0 AF. *See* Finding of Fact 78; *see also* R. vol. 37, at 7105.

iv. Milner

75. Similar to A&B, Milner's reservoir space has the second lowest average annual rate of fill of all entities and has a high degree of variability in fill. *See* Finding of Fact 69. In dry years, the potential exists that Milner's actual carryover will be less than the maximum projected carryover need. *See* Finding of Fact 68, 70. Milner has an approximate one and one half water supply available in storage. *See* Finding of Fact 71. Because of its rate of fill, it is likely Milner will experience carryover shortfalls in consecutive dry years. Based on the evaluation criteria for reasonable carryover in CM Rule 42.01.g, the maximum projected carryover need of 16,100 AF is the reasonable carryover for Milner. *See* Finding of Fact 78.

v. NSCC

76. NSCC has a near-average annual rate of fill in comparison to all entities and an approximate one-year water supply available in storage. *See* Findings of Fact 69 & 71. In dry years, the potential exists that its maximum projected carryover need will be less than its actual carryover. *See* Finding of Fact 68, 70. Based on the evaluation criteria in CM Rule 42.01.g, the reasonable carryover for NSCC is 113,300 AF. *See* Finding of Fact 78.

vi. TFCC

77. TFCC has a near average annual rate of fill in comparison to all entities, but only 20% of a single year's water supply is available in storage. TFCC's storage space fills 97% of

the time and has a fill variability of 8%. *See* Findings of Fact 69 & 71. In dry years, the potential exists that its maximum projected carryover need will be less than its actual carryover. *See* Finding of Fact 68, 70. Based on the evaluation of the criteria in CM Rule 42.01.g, the reasonable carryover can be adjusted from the maximum projected carryover need without shifting the risk of shortage to the senior right holder. The historical average carryover in dry years of 37,400 AF is the reasonable carryover for TFCC. *See* Finding of Fact 78.

78. Reasonable carryover values for the SWC members are as follows:

	Reasonable Carryover (Acre-Feet)
A&B	22,700
AFRD2	16,700
BID	0
Milner	16,100
Minidoka	0
NSCC	113,300
TFCC	37,400

E. Reasonable Carryover Shortfall

79. Reasonable carryover shortfall is the numerical difference between reasonable carryover and actual carryover, calculated at the conclusion of the irrigation season. Actual carryover is defined as the storage allocation minus the total storage use plus or minus any adjustments. Examples of adjustments include SWC water placed in the rental pool and SWC private leases. Adjustments are unique to each irrigation season and will be evaluated each year. Any storage water deliveries to entities other than the SWC for purposes unrelated to the original right will be adjusted so that the water is not included as a part of the SWC carryover volume. Water that is purchased or leased by an SWC member may become part of the carryover shortfall obligation. *See e.g.,* R. vol. 38, at 7201 n.11 (Eighth Supplemental Order). Conversely, actual carryover must be adjusted to assure that water supplied by a SWC member to private leases or to the rental pool will not increase the reasonable carryover shortfall obligation to the same SWC member.

80. Reasonable carryover shortfall is calculated as follows:

Reasonable Carryover Shortfall = Actual Carryover – Reasonable Carryover

F. Determination of Curtailment Date

81. The Eastern Snake Plain Aquifer Model ("ESPAM") is the best scientific tool available to simulate aquifer and Snake River responses to stresses applied to the aquifer, such as ground water pumping from a well. Curtailment of junior ground water pumpers in response to the SWC Delivery Call would result in a reduction in the withdrawal of groundwater and a corresponding reduction in aquifer stress. ESPAM simulates the effects of the reduction in

aquifer stress and calculates predicted increases in aquifer discharge to the Snake River resulting from the curtailment of ground water pumping from the ESPA.

82. ESPAM simulations can be either steady-state or transient.

83. Merriam-Webster's Dictionary defines steady-state as "a state or condition of a system or process . . . that does not change in time." *Steady state*, Merriam-Webster.com, https://www.merriam-webster.com/dictionary/steady-state (April 19, 2023). A steady-state ESPAM simulation can only model increases in aquifer discharge to the Snake River resulting from continuous curtailments of an identical magnitude and location until the impacts of curtailment are fully realized. For example, a steady-state analysis of the curtailment of 1,000 acres, assumes that irrigation of the same 1,000 acres is curtailed every year at the same rate of consumptive use, until the impacts of that curtailment reach a steady state, or no longer change from year to year.

84. Steady-state analysis does not calculate the time to reach steady-state conditions nor describe the seasonal timing of the impacts. For the benefits of curtailment predicted by steady-state analysis to be realized by the river, the curtailment must occur continuously until steady-state is achieved. The assumption of continuous curtailment does not reflect reality in the SWC Delivery Call. Curtailments ordered as prescribed in the methodology are neither continuous nor long-term. Irrigation with ground water does not occur at a constant rate throughout the year nor from year to year. It is important to predict what benefits to the river are realized during the irrigation season in which injury has been determined. A steady-state ESPAM simulation cannot predict what benefits are realized during the irrigation season. In contrast, a transient ESPAM simulation will predict the timing of changes in river reach gains.

85. ESPAM was calibrated using one-month stress periods and can simulate a single (or partial) irrigation season of curtailment and predict the resulting increase in aquifer discharge to the Snake River during the same irrigation season using a transient simulation. In the context of this proceeding, the transient approach identifies the junior ground water rights that must be curtailed to produce increases in Snake River flows sufficient to offset material injury in the current irrigation season.

86. Only 9% to 15% of the steady state response is predicted to accrue to the near Blackfoot to Minidoka reach between May 1 and September 30 of the same year.[24] Fifty percent of the steady-state response is predicted to accrue at the near Blackfoot to Minidoka reach within approximately four years. Ninety percent of the steady-state response is predicted to accrue at the near Blackfoot to Minidoka reach within approximately 24 years.

87. A curtailment to a priority date calculated by the steady state analysis method used in the Fourth Methodology Order will only offset 9% to 15% of the predicted IDS. In contrast, curtailment to a priority date calculated with a transient simulation of a single season curtailment will offset the full predicted IDS unless the shortfall exceeds the accruals to the near

[24] The near Blackfoot to Minidoka reach is the reach of the Snake River from which the SWC diverts its water supplies.

Blackfoot to Minidoka reach by the end of the irrigation season with curtailment of all junior ground water rights.

88. Steady-state simulations are appropriate for evaluating the average annual impact of aquifer stresses that have been, or will be, applied for decades (i.e., ground water pumping year after year, or continuous curtailment to the same date every year). The steady-state simulation of continuous curtailment applied in the Fourth Amended Methodology Order does not simulate the short-term curtailments prescribed in the methodology. The methodology prescribes curtailment only in years with a predicted IDS or carryover shortfall and prescribes the determination of a curtailment priority date that varies with the magnitude of the predicted shortfall.

89. Transient simulations are necessary to evaluate the impacts of aquifer stresses applied for short periods of time (i.e., short-term curtailments with varying priority dates). Transient simulations are necessary to simulate the short-term curtailments prescribed in the methodology.

CONCLUSIONS OF LAW

1. This order contains the methodology by which the Director will determine material injury to RISD and reasonable carryover to members of the SWC.

2. "The agency's experience, technical competence, and specialized knowledge may be utilized in the evaluation of the evidence." Idaho Code § 67-5251(5); IDAPA 37.01.01.600.

3. Idaho Code § 42-602 states that, "The director of the department of water resources shall have discretion and control of the distribution of water from all natural sources . . . . The director of the department of water resources shall distribute water . . . in accordance with the prior appropriation doctrine." According to the Hearing Officer, "It is clear that the Legislature did not intend to grant the Director broad powers to do whatever the Director might think right. However, it is clear also that the Legislature [in Idaho Code § 42-602] did not intend to sum up water law in a single sentence of the Director's authority." R. vol. 37, at 7085. "Given the nature of the decisions which must be made in determining how to respond to a delivery call, there must be some exercise of discretion by the Director." *American Falls Res. Dist. No. 2 v. Idaho Dept. Water Resources*, 143 Idaho 862, 875, 154 P.3d 433, 446 (2007).

4. "The prior appropriation doctrine is comprised of two bedrock principles—that the first appropriator in time is the first in right and that water must be placed to a beneficial use." *In Matter of Distribution of Water to Various Water Rights Held by or for the Benefit of A & B Irrigation Dist.*, 155 Idaho 640, 650, 315 P.3d 828, 838 (2012). "The concept that beneficial use acts as a measure and limit upon the extent of a water right is a consistent theme in Idaho water law." *Id.*; *American Falls*, 143 Idaho at 879, 154 P.3d at 450 (stating that while an appropriation for a beneficial use is "a valuable right entitled to protection . . . . Nevertheless, that property right is still subject to other requirements of the prior appropriation doctrine."); *Idaho Ground Water Assoc. v. Idaho Dep't of Water Res.*, 160 Idaho 119, 131, 369 P.3d 897, 909

(2016) (explaining the "policy of beneficial use" serves as a "limit on the prior appropriation doctrine.").

5. "Concurrent with the right to use water in Idaho 'first in time,' is the obligation to put that water to beneficial use." *American Falls*, 143 Idaho at 880, 154 P.3d at 451; *see In re Distribution of Water to Various Water Rights Held by or for the Ben. of A&B Irr. Dist.*, 155 Idaho at 652, 315 P.3d at 840 (quoting *American Falls*, 143 Idaho at 876, 154 P.3d at 447) (referring to "'the constitutional requirement that priority over water be extended only to those using the water'"). "'It is the settled law of this state that no person can, by virtue of a prior appropriation, claim or hold more water than is necessary for the purpose of the appropriation, and the amount of water necessary for the purpose of irrigation of the lands in question and the condition of the land to be irrigated should be taken into account.'" *In re Distribution of Water to Various Water Rights Held by or for the Ben. of A&B Irr. Dist.*, 155 Idaho at 650, 315 P.3d at 838 (quoting *Washington State Sugar v. Goodrich*, 27 Idaho 26, 44, 147 P. 1073, 1079 (1915)).

6. "[T]he policy of securing the maximum use and benefit, and least wasteful use of Idaho's water resources, has long been the policy in Idaho." *Idaho Ground Water Assoc.*, 160 Idaho at 131, 369 P.3d at 909 (citing *Clear Springs Foods, Inc. v. Spackman*, 150 Idaho 790, 808, 252 P.3d 71, 89 (2011)). The Idaho Constitution enunciates a policy of promoting "optimum development of water resources in the public interest." Idaho Const. Art. XV, § 7; *Baker v. Ore-Ida Foods, Inc.,* 95 Idaho 575, 584, 513 P.2d 627, 636 (1973). "There is no difference between securing the maximum use and benefit and least wasteful use of this State's water resources and the optimum development of water resources in the public interest. Likewise, there is no material difference between 'full economic development' and the 'optimum development of water resources in the public interest.' They are two sides of the same coin. Full economic development is the result of the optimum development of water resources in the public interest." *Clear Springs*, 150 Idaho at 809, 252 P.3d at 90. "The policy of securing the maximum use and benefit, and least wasteful use, of the State's water resources applies to both surface and ground waters, and it requires that they be managed conjunctively." *Id.*

7. "Conjunctive administration 'requires knowledge by the [Department] of the relative priorities of the ground and surface water rights, how the various ground and surface water sources are interconnected, and how, when, where and to what extent the diversion and use of water from one source impacts the water flows in that source and other sources.' . . . . That is precisely the reason for the CM Rules and the need for analysis and administration by the Director." *American Falls,* 143 Idaho at 877, 154 P.3d at 448.

8. The CM Rules incorporate all principles of the prior appropriation doctrine as established by Idaho law. *American Falls*, 143 Idaho at 873, 154 P.3d at 444; CM Rule 20.02, 10.12.

9. While the presumption under Idaho law is that an appropriator is entitled to his decreed water right and the CM Rules may not be applied to require a senior appropriator to demonstrate an entitlement to the water in the first place, there may be post-adjudication factors relevant to the determination of how much water is actually needed in responding to a delivery call. *American Falls*, 143 Idaho at 877–78, 154 P.3d at 448–49. Under the CM Rules and Idaho law, the Director has the "authority and responsibility to investigate claims when delivery calls

are made," and the "authority to evaluate the issue of beneficial use in the administration context." *In re Distribution of Water to Various Water Rights Held by or for the Ben. of A&B Irr. Dist.*, 155 Idaho at 652, 315 P.3d at 840. As the Idaho Supreme Court stated, "'[w]hile the prior appropriation doctrine certainly gives pre-eminent rights to those who put water to beneficial use first in time, this is not an absolute rule without exception . . . the Idaho Constitution and statutes do not permit waste and require water to be put to beneficial use or be lost.'" *Idaho Ground Water Assoc.*, 160 Idaho at 131, 369 P.3d at 909 (quoting *American Falls*, 143 Idaho at 880, 154 P.3d at 433). "[T]he Director must have some discretion to balance these countervailing considerations in a delivery call." *Id*. "'If this Court were to rule the Director lacks the power in a delivery call to evaluate whether the senior is putting the water to beneficial use, we would be ignoring the constitutional requirement that priority over water be extended only to those using the water.'" *In re Distribution of Water to Various Water Rights Held by or for the Ben. of A&B Irr. Dist.*, 155 Idaho at 652, 315 P.3d at 840 (quoting *American Falls*, 143 Idaho at 876, 154 P.3d at 447).

10. In responding to a delivery call under the CM Rules, the Director "may employ a baseline methodology as a starting point for considering material injury," provided the baseline methodology otherwise comports with the prior appropriation doctrine as established by Idaho law. *In re Distribution of Water to Various Water Rights Held by or for the Ben. of A&B Irr. Dist.*, 155 Idaho at 653, 315 P.3d at 841; *see Methodology Remand Order* at 17.

11. Once the Director determines "that material injury is occurring or will occur," junior appropriators subject to the delivery call bear "the burden of proving that the call would be futile or to challenge, in some other constitutionally permissible way, the senior's call." *American Falls*, 143 Idaho at 878, 154 P.3d at 449; *Methodology Remand Order* at 31. Junior appropriators have the burden of proving by clear and convincing evidence that the delivery call is futile or otherwise unfounded. *In re Distribution of Water to Various Water Rights Held by or for the Ben. of A&B Irr. Dist.*, 155 Idaho at 653, 315 P.3d at 841.

12. "This case illustrates the tension between the first in time and beneficial use aspects of the prior appropriation doctrine." *In re Distribution of Water to Various Water Rights Held by or for the Ben. of A&B Irr. Dist.*, 155 Idaho at 650, 315 P.3d at 838. The Idaho Supreme Court has in this case "recognized the critical role of the Director in managing the water resources to accommodate both first in time and beneficial use aspects: 'Somewhere between the absolute right to use a decreed water right and an obligation not to waste it and to protect the public's interest in this valuable commodity, lies an area for the exercise of discretion by the Director.'" *Id.* at 651, 315 P.3d at 839 (quoting *American Falls*, 143 Idaho at 880, 154 P.3d at 451). Thus, in this case the Director may use "a baseline methodology, both as a starting point for consideration of the Coalition's call and in determining the issue of material injury." *Id.* at 650–51, 315 P.3d at 838–39. However, "[i]f changing conditions establish that material injury is greater than originally determined pursuant to the baseline analysis, then adjustments to the mitigation obligation of the juniors must be made when the Director undertakes his mid-season calculations." *Methodology Remand Order* at 18.

13. In the context of conjunctive administration, the Director's methodology for projecting material injury does not impose an obligation upon members of the SWC to reprove

their water rights. To the extent water is available, members of the SWC are authorized to divert and store water in accordance with the terms of their licenses or decrees. Nothing established herein reduces that authorization. The question that the CM Rules require the Director to answer in this proceeding is, when water is not available to fill the water rights of the SWC, how much water is reasonably necessary for the SWC to accomplish the beneficial purpose of raising crops; because what is needed to irrigate crops may be less than the decreed or licensed quantities. *American Falls*, 143 Idaho at 880, 154 P.3d at 451; *see In re Distribution of Water to Various Water Rights Held by or for the Ben. of A&B Irr. Dist.*, 155 Idaho at 650, 315 P.3d at 838 (quoting *Washington State Sugar*, 27 Idaho at 44, 147 P. at 1079) ("'[i]t is the settled law of this state that no person can, by virtue of a prior appropriation, claim or hold more water than is necessary for the purpose of the appropriation"). Again, "[t]he concept that beneficial use acts as a measure and limit upon the extent of a water right is a consistent theme in Idaho water law." *Id.*

14. Holders of senior-priority water rights may receive less than their licensed or decreed quantities and not suffer material injury within the meaning of the CM Rules. As a result, in-season demand should be viewed in light of reasonableness and optimum development of water resources in the public interest. CM Rules 20 and 42; *American Falls*, 143 Idaho at 876–80, 154 P.3d at 447–51; *In re Distribution of Water to Various Water Rights Held by or for the Ben. of A&B Irr. Dist.*, 155 Idaho at 650–52, 315 P.3d at 838–40.

15. Here, the Director has established a methodology for determining material injury to members of the SWC. The methodology predicts material injury to RISD by taking the difference between RISD and the FS. The years 2000 through 2021 were analyzed to select the BLY because the period of years captured current irrigation practices in a dry climate. Based upon evaluation of the record, members of the SWC were exercising more reasonable efficiencies during this time period than during the 1990s when supplies were more plentiful. During periods of drought when junior ground water users are subject to curtailment, members of the SWC should exercise reasonable efficiencies to promote the optimum utilization of the State's water resources. CM Rules 20 and 42; *American Falls,* 143 Idaho at 876–80, 154 P.3d at 447-51; *Clear Springs*, 150 Idaho at 807–10; 252 P.3d at 88–91; *In re Distribution of Water to Various Water Rights Held by or for the Ben. of A&B Irr. Dist.*, 155 Idaho at 650–52, 315 P.3d at 838–40.

16. At this time, with the recognition that the methodology is subject to adjustment and refinement, RISD will be equal to the historic demands associated with the BLY (2018) and will be corrected during the season to account for variations in climate and water supply between the BLY and actual conditions.

17. Recognizing that climate and surface water supplies (natural flow and storage) are inherently variable, the Director's predictions of material injury to RISD and reasonable carryover are based upon the best available information and the best available science, in conjunction with the Director's professional judgment as the manager of the State's water resources. Recognizing his ongoing duty to administer the State's water resources, the Director should use available data, and consider new analytical methods or modeling concepts, to evaluate the methodology. As more data is gathered and analyzed, the Director will continue to

review and refine the process of predicting and evaluating material injury. The methodology will continue to be adjusted if the data supports a change.

18. If the Director predicts that the SWC will be materially injured because of a demand shortfall prediction, either in the preseason or in the midseason, the demand shortfall represents a mitigation obligation that must be borne by junior ground water users. If mitigation water in the amount of the projected RISD shortfall cannot be secured or optioned by junior ground water users to the satisfaction of the Director, the Director will curtail junior ground water users to make up any deficit. *See* Order on Pet. for Jud. Rev., at 19, *A&B Irrigation District v. Idaho Dairymen's Association, Inc.*, No. 2008-0000551 (Gooding Cnty. Dist. Ct. Idaho July 24, 2009),

19. In previous years, the Director used steady-state modeling when determining the curtailment priority date. As part of the Director's ongoing obligation to evaluate the methodology, the Director must evaluate whether the use of steady-state continues to be supportable.

20. In surface water administration, uses by holders of junior priority surface water rights are curtailed until the senior surface water rights are fully satisfied, absent a futile call and if the senior surface water users need the water to accomplish a beneficial use. In other words, under surface water administration, junior surface water rights are generally curtailed unless the senior gets water in the quantity and at the time and place required.

21. Rule 43 of the CM Rules mandates that when the Director evaluates a mitigation plan, the mitigation plan must ensure that water is delivered to holders of senior priority surface water rights in both the quantity and at the time and place required by the senior. In considering a proposed mitigation plan pursuant to Rule 43, the Director must evaluate:

> **b.** Whether the mitigation plan will provide replacement water, *at the time and place required by the senior-priority water right*, sufficient to offset the depletive effect of ground water withdrawal on the water available in the surface or ground water source *at such time and place as necessary* to satisfy the rights of diversion from the surface or ground water source. Consideration will be given to the history and seasonal availability of water for diversion so as not to require replacement water at times when the surface right historically has not received a full supply, such as during annual low-flow periods and extended drought periods.
>
> **c.** Whether the mitigation plan provides replacement water supplies or other appropriate compensation to the senior-priority water right *when needed during a time of shortage* even if the effect of pumping is spread over many years and will continue for years after pumping is curtailed. A mitigation plan may allow for multi-season accounting of ground water withdrawals and provide for replacement water to take advantage of variability in seasonal water supply. The mitigation plan must include contingency provisions to assure protection of the senior-priority right in the event the mitigation water source becomes unavailable.

IDAPA 37.01.03.11.043.b–c (emphasis added). In other words, there is an assumption that senior water right holders calling for delivery of water under the CM Rules will receive, by curtailment or by mitigation, "replacement water at the time and place required by the senior-priority water right, sufficient to offset the depletive effect of ground water withdrawal . . . ." Only in a mitigation plan can "multi-season accounting of ground water withdrawals" be employed, and even then, the plan must "assure protection of the senior-priority right in the event the mitigation water source becomes unavailable."

22. The Director has an obligation to address a mitigation deficiency in the year it occurs. Mem. Decision & Order on Pet. for Jud. Rev., at 10, *Rangen, Inc. v. Idaho Dep't of Water Res.*, No. CV-2014-2446 (Twin Falls Cnty. Dist. Ct. Idaho Dec. 3, 2014); Mem. Decision & Order, at 8–9, *Rangen, Inc. v. Idaho Dep't of Water Res.*, No. CV-2014-4970 (Twin Falls Cnty. Dist. Ct. Idaho June 1, 2015).

23. The Director is also obligated to administer consistent with the guidance from the Courts. The Director concludes that any IDS determined by this methodology must be replaced by curtailment in time, place, and quantity unless mitigation allows for out-of-priority diversion of ground water.

24. As described in Finding of Fact 87, curtailment to a priority date calculated by the steady state analysis method used in the Fourth Methodology Order will only offset 9% to 15% of the predicted IDS. In contrast, curtailment to a priority date calculated with a transient simulation of a single season curtailment will offset the *full* predicted IDS unless the shortfall exceeds the accruals to the near Blackfoot to Minidoka reach by the end of the irrigation season with curtailment of all junior ground water rights. This methodology order depends on an annual evaluation of material injury and should also employ curtailment and or mitigation that supplies replacement water at the time and place required by the senior-priority water right in a quantity sufficient to offset the depletive effect of ground water withdrawal and to assure protection of the senior-priority right. Curtailment dates, periodically determined at time of recalculating in-season demand shortfall (IDS), should be calculated by a transient model simulation that will return the full quantity of water to the senior priority rights at the time and place required.

25. As described in Conclusion of Law 18, junior ground water users with approved mitigation plans to deliver storage water as mitigation must, to the satisfaction of the Director, secure or option mitigation water to avoid curtailment. By requiring that junior ground water users secure mitigation water or have options to acquire water in place during the season of need, the Director ensures that the SWC does not carry the risk of shortage to their supply. By not requiring junior ground water users to deliver or assign mitigation water until the Time of Need, the Director ensures that junior ground water users supply only the amount of mitigation water necessary to satisfy the RISD. All approved methods of mitigation shall be considered in the Director's review of projected RISD shortfall.

26. Unless there is reasonable certainty that junior ground water users can secure the predicted volume of water and provide that water at the Time of Need, the protection afforded to the senior water right holders is compromised. The risk of shortage is then impermissibly shouldered by the SWC. Members of the SWC should have certainty entering the irrigation

season and at midseason that mitigation water will be delivered or assigned at the Time of Need, or curtailment of junior ground water rights will be ordered.

27. Because climate and the supply that the SWC appropriated (natural flow and storage) are inherently variable, the Director cannot and should not insulate the SWC against all shortages. The Director can, however, protect the SWC against reasonably predicted shortages to RISD.

28. Currently, the USBR and USACE's Joint Forecast is an indispensable predictive tool at the Director's disposal for predicting material injury to RISD. Given current forecasting techniques, the earliest the Director can predict material injury to RISD with reasonable certainty is soon after the Joint Forecast is issued in early April. The pre-irrigation season supply forecast for A&B and Milner can be predicted solely from the Joint Forecast. To improve the accuracy of prediction, the pre-irrigation season supply forecast for AFRD2, BID, Minidoka, NSCC, and TFCC will currently be predicted from both the Joint Forecast and from flow data at Box Canyon.[25]

29. By shifting the April Forecast Supply prediction curve down one standard error of estimate, the Director purposely underestimates the water supply that is predicted. The Director further guards against RISD shortage by using the 2018 BLY, which has above average diversions, above average ET, below average in-season precipitation, and above average growing degree days. The 2018 BLY represents a year in which water supply did not limit diversions. The Director's prediction of material injury to RISD is purposely conservative. While it may ultimately be determined after final accounting that less mitigation water was owed than was provided, this is an appropriate burden for junior appropriators to carry. Idaho Cost. Art. XV, § 3; Idaho Code § 42-106. Shifting the prediction curve down one standard error of estimate and adoption of a BLY that uses above average diversions, above average temperatures and ET and below average precipitation is necessary to protect senior rights if the Director administers to an amount less than the full decreed quantity of the SWC's rights. *Methodology Remand Order* at 33, 35.

30. The Director will review, at the end of the season, the volume and efficiencies of application of surface water, the amount of mitigation water provided by junior ground water users, and may, in the exercise of his professional judgment, readjust the reasonable carryover shortfalls to reflect these considerations.

31. "Storage water is water held in a reservoir and is intended to assist the holder of the water right in meeting their decreed needs." *American Falls*, 143 Idaho at 878, 154 P.3d at 449. "Carryover is the unused water in a reservoir at the end of the irrigation year which is retained or stored for future use in years of drought or low-water." *Id.* Under Idaho Code, "[o]ne may acquire storage water rights and receive a vested priority date and quantity, just as with any other water right," but "[t]here is no statutory provision for obtaining a decreed right to 'carryover' water." *Id.* Rather, carryover is a "component of the storage right." Order on Pet. for Jud. Rev., at 20, *A&B Irrigation District v. Idaho Dairymen's Association, Inc.*, No. 2008-

[25] The method for predicting the natural flow supply may be subject change based upon improved predictive models.

0000551 (Gooding Cnty. Dist. Ct. Idaho July 24, 2009). Storage carryover is "permissible . . . absent abuse." *American Falls*, 143 Idaho at 880, 154 P.3d at 451.

32. The storage reservoirs implicated in this proceeding were intended to provide supplemental supplies of water "to create a buffer against the uncertainty of the weather." *Opinion Constituting Findings of Fact, Conclusions of Law and Recommendation* (April 29, 2008) at 6. "The history of the development of the reservoir system, most recently Palisades, makes it clear that storage of water was a primary purpose to prevent disaster during periods of shortage as have been experienced in the recent past." *Id*. at 60. The purpose of carryover also is "insurance against the risk of future shortage." Order on Pet. for Jud. Rev., at 20, *A&B Irrigation District v. Idaho Dairymen's Association, Inc.*, No. 2008-0000551 (Gooding Cnty. Dist. Ct. Idaho July 24, 2009).

33. CM Rule 42.01 sets forth factors the Director "may consider in determining whether the holders of water rights are suffering material injury and using water efficiently and without waste." CM Rule 42.01 does not limit the Director's determination of reasonable carryover to consideration of the factors enumerated in CM Rule 42.01g, but only requires that the Director consider those enumerated factors. One such factor is "[t]he extent to which the requirements of the holder of a senior priority water right could be met with the user's existing facilities and water supplies." CM Rule 42.01g. This factor is qualified, however, by the provision that "the holder of a surface water storage right shall be entitled to maintain a reasonable amount of carry-over storage to assure water supplies for future dry years." CM Rule 42.01g. Thus, CM Rule 42.01g does not require water right holders to exhaust their storage water supplies prior to making a delivery call under the CM Rules. This is consistent with the purposes of the storage reservoirs and the carryover components of the storage water rights.

34. In considering CM Rule 42.01g in *American Falls*, the Idaho Supreme Court framed the SWC's challenge to the "reasonable carryover" provision as presenting the question of whether the holders of storage water rights are "entitled to insist on all available water to carryover for future years in order to assure that their full storage water is met (regardless of need)," *American Falls,* 143 Idaho at 879, 154 P.3d at 450, and answered this question in the negative:

> At oral argument, one of the irrigation district attorneys candidly admitted that their position was that they should be permitted to fill their entire storage water right, regardless of whether there was any indication that it was necessary to fulfill current or future needs and even though the irrigation districts routinely sell or lease the water for uses unrelated to the original rights. This is simply not the law of Idaho. While the prior appropriation doctrine certainly gives pre-eminent rights to those who put water to beneficial use first in time, this is not an absolute rule without exception. As previously discussed, the Idaho Constitution and statutes do not permit waste and require water to be put to beneficial use or be lost. Supra, paragraph 11.

Id. at 880, 154 P.3d at 451.

35. As discussed in the Findings of Fact, reasonable carryover is determined by projecting the water supply for the system. This is accomplished by projecting the 2002/2004 natural flow and average annual storage fill and the 2018 demand. Next, the Director examines the average annual rate of fill of each SWC entity's reservoir space to determine each entity's relative probability of fill. Finally, the Director examines the average annual carryover for prior comparable water conditions by reviewing Heise natural flow.

36. On or before November 30, the Department will issue estimates of actual carryover and reasonable carryover shortfall volumes for all members of the SWC. These estimates will establish the obligation of junior ground water users in providing water to the SWC for reasonable carryover shortfall. Fourteen (14) days following the issuance by the Department of reasonable carryover short fall obligations, junior ground water users will be required to establish, to the satisfaction of the Director, their ability to supply a volume of storage water or to conduct other approved mitigation activities that will provide water to the injured members of the SWC equal to the reasonable carryover shortfall for all injured members of the SWC. If junior ground water users cannot provide this information, the Director will issue an order curtailing junior ground water rights.

37. Recognizing that reservoir space held by members of the SWC may fill, and to prevent the waste of water, junior ground water users are not required to deliver or assign the volume of reasonable carryover until after the Day of Allocation (defined in footnote 11, *infra*). Junior ground water users are obligated to hold the secured or optioned mitigation water until reservoir space held by the SWC fills. If the reservoir space does not fill, junior ground water right holders must deliver or assign the secured or optioned mitigation water to the senior water right holders up to the amount of storage space that did not fill.

ORDER

Consistent with the forgoing, the Director HEREBY ORDERS that, for purposes of determining material injury to RISD and reasonable carryover, the following steps will be taken:

1. Step 1: By April 1, members of the SWC will submit electronic shape files to the Department delineating the total anticipated irrigated acres for the upcoming year within their water delivery boundary or confirm in writing that the existing electronic shape file submitted by SWC has not varied by more than five percent. Department staff will review submitted shapefiles and modify them as necessary to ensure that: (1) the total acreage count does not exceed the decreed number of acres; (2) all of the irrigated land is located within the decreed place of use; and (3) acres are not counted more than once due to overlapping polygons within a shape file or between shape files submitted by different SWC members. Because the SWC members can best determine the irrigated acres within their service area, the SWC should be responsible for submitting the information to the Department. If this information is not timely submitted, the Department will determine the total irrigated acres based upon past cropping patterns and current satellite and/or aerial imagery. If a SWC member fails or refuses to identify the number of irrigated acres within its service area by April 1, the Department will be cautious about recognizing acres as being irrigated if there is uncertainty about whether the acres are or will be irrigated during the upcoming irrigation season. The Department will electronically post

electronic shape files for each member of the SWC for the current water year for review by the parties. In determining the total irrigated acreage, the Department may account for supplemental ground water use. The Department currently does not have sufficient information to accurately determine the contribution of supplemental ground water to lands irrigated with surface water by the SWC. If and when reliable data is available to the Department, the methodology will be amended to account for the supplemental ground water use.

2. If the acreage count is under reported by more than five percent of the irrigated acreage limit of the water right, then the Department will assess the impact of this reduction in use of the water right on any mitigation requirement.

3. Step 2: Typically within the first two weeks of April, the USBR and USACE issue their Joint Forecast that predicts an unregulated inflow volume at the Heise Gage for the period April 1 through July 31. Within fourteen (14) days after issuance of the Joint Forecast, the Director will issue a final order predicting the April FS for the water year for each SWC entity. The Director will compare the April FS for each SWC entity to the BD for each SWC entity to determine if an in-season demand shortfall ("IDS") is anticipated for the upcoming irrigation season. The April FS for each SWC entity is the sum of the forecasted natural flow supply and the forecasted storage allocation for each SWC entity. The forecasted natural flow supply will be computed with regression algorithms. The forecasted storage allocation will be determined by comparing storage accruals in an analogous year(s). A transient ESPAM simulation will be run to calculate the curtailment priority date predicted to produce a volume of water equal to the IDS in the near Blackfoot to Minidoka reach between May 1 and September 30 of the current year. Curtailment will be simulated within the area of common ground water supply as described by CM Rule 50.01.

4. Step 3: By May 1, or within fourteen (14) days from issuance of the final order predicting the April FS, whichever is later in time, junior ground water users with approved mitigation plans for delivery of water must secure, to the satisfaction of the Director, a volume of water equal to their proportionate share of the April IDS unless the April IDS is revised as explained below in paragraph 6. If junior ground water users secured water for a reasonable carryover shortfall to an individual SWC member in the previous year, the current-year mitigation obligation to the individual SWC member will be reduced by the quantity of water secured for the reasonable carryover shortfall. The secured water will not be required to be delivered to the injured members of the SWC until the Time of Need.

5. Step 4: As soon as practical after the deadline for junior ground water users with approved mitigation plans to provide notice of secured water, the Director will issue an order curtailing junior ground water users who: (1) do not have approved mitigation plans; (2) fail to secure the required water consistent with their approved mitigation plans; or (3) otherwise fail to comply with their approved mitigation plans.[26]

[26] This presumes that any reasonable carryover obligation has been met, and that junior ground water users are not already under prior curtailment from deficiencies in meeting the previous year's obligation.

6. If, at any time prior to the Director's final determination of the April FS, the Director can determine with certainty that any member of the SWC has diverted more natural flow than predicted, or has accrued more storage than predicted, the Director will revise his initial, projected demand shortfall determination.

7. Step 5: If the storage allocations held by members of the SWC fill, there is no reasonable carryover shortfall. If the storage allocations held by members of the SWC do not fill, within fourteen (14) days following the publication of Water District 01's initial storage report, which typically occurs soon after the Day of Allocation,[27] the volume of water secured by junior ground water users to fulfill the reasonable carryover shortfall shall be made available to injured members of the SWC. The amount of reasonable carryover to be provided shall not exceed the empty storage space on the Day of Allocation for that entity. If water is owed in addition to the reasonable carryover shortfall volume, this water shall be delivered or assigned to members of the SWC at the Time of Need, described below. The Time of Need will be no earlier than the Day of Allocation.

8. Step 6: Approximately halfway through the irrigation season, but following the events described in Step 5, the Director will, for each member of the SWC: (1) recalculate RISD; (2) issue a revised FS; and (3) estimate the Time of Need date.[28]

9. RISD will be calculated utilizing the project efficiency, BD, and the cumulative actual CWN determined up to that point in the irrigation season. The cumulative CWN volume will be calculated for all land irrigated with surface water within the boundaries of each member of the SWC. Volumetric values of CWN will be calculated using ET and precipitation values from the USBR's AgriMet program, irrigated areas provided by each entity, and crop distributions based on NASS data.

10. The FS for each SWC is the sum of the year-to-date actual natural flow diversions, the forecasted natural flow supply for the remainder of the season, and the storage allocation for each member of the SWC. The forecasted natural flow supply for the remainder of the season will be based on regression analysis. The storage allocation will be based on the actual preliminary storage allocations issued by the BOR and Water District 01. If the BOR and Water District 01 have not yet allocated stored water to spaceholders, the Department will predict the storage allocations based on an analogous year(s).

11. The calendar day determined to be the Time of Need is established by predicting the day in which the remaining storage allocation will be equal to reasonable carryover. The Time of Need will not be earlier than the Day of Allocation.

---

[27] The Day of Allocation is the time in the irrigation season when the Water District 01 watermaster can issue allocations to storage space holders after the reservoir system has achieved its maximum physical fill, maximum water right accrual, and any excess spill past Milner Dam has ceased. Tr., at 902:7–25, 903:1–10.

[28] At the earliest established Time of Need for any member of the SWC, junior ground water users are required to provide remaining mitigation to all materially injured members of the SWC.

12. This information will be used to recalculate RISD and adjust the projected IDS for each member of the SWC. The Director will then issue revised RISD and DS values. Any increase to the projected IDS for each SWC entity is an additional mitigation obligation of the junior ground water users.

13. Upon a determination of an additional mitigation obligation, junior ground water users will be required to establish, to the satisfaction of the Director, their ability to secure a volume of storage water or to conduct other approved activities pursuant to an approved mitigation plan that will deliver the additional mitigation obligation water to the injured members of the SWC at the Time of Need. If junior ground water users fail or refuse to submit this information within fourteen (14) days from issuance of a Step 6 order, the Director will issue an order curtailing junior ground water users.[29] A transient ESPAM simulation will be run to determine the priority date to produce the necessary additional mitigation obligation volume by September 30 of the same year. Curtailment will be simulated within the area of common ground water supply, as described by CM Rule 50.01.

14. Step 7: Shortly before the estimated Time of Need, but following the events described in Steps 5 and 6, the Director will, for each member of the SWC: (1) recalculate RISD; (2) issue a revised FS; and (3) establish the Time of Need. The revised FS for each SWC entity is the sum of the year-to-date actual natural flow diversions, the forecasted natural flow supply for the remainder of the season, and the storage allocation for each member of the SWC. The forecasted natural flow supply for the remainder of the season will be based on analogous year(s) with similar Blackfoot to Milner reach gains. The storage allocation will be based on the actual preliminary storage allocations issued by the BOR and Water District 01.

15. This information will be used to recalculate RISD and adjust the projected IDS for each member of the SWC. RISD will be calculated utilizing the project efficiency, BD, and the cumulative actual CWN determined up to that point in the irrigation season. The Director will then issue revised RISD and IDS values.

16. A transient ESPAM simulation will be run to determine the priority date of water rights that must be curtailed to produce the demand shortfall volume by September 30 of the same year. Curtailment will be simulated within the area of common ground water supply, as described by CM Rule 50.01.

17. Step 8: At the Time of Need, junior ground water users are required to deliver to each injured member of the SWC the Step 7 revised IDS calculated at the Time of Need. Alternatively, any additional mitigation obligation calculated in Step 6 and Step 7 can be satisfied from each SWC member's reasonable carryover if (a) the reasonable carryover exceeds the additional mitigation obligation, and (b) the junior ground water users secure sufficient water to replace the reasonable carryover pursuant to an approved mitigation plan.

[29] This presumes that any reasonable carryover obligation has been met, and that junior ground water users are not already under prior curtailment from deficiencies in meeting the previous year's obligation.

18. The Director will review, at the end of the season, the volume and efficiencies of application of surface water, the amount of mitigation water delivered by junior ground water users, and may, in the exercise of his professional judgment, readjust the reasonable carryover shortfalls to reflect these considerations.

19. Step 9: Following the end of the irrigation season (on or before November 30), the Department will determine the total actual volumetric demand and total actual CWN for the entire irrigation season. This information will be used for the analysis of reasonable carryover shortfall, selection of future BLY, and for the refinement and continuing improvement of the method for future use.

20. On or before November 30, the Department will issue estimates of actual carryover and reasonable carryover shortfall volumes for all members of SWC. These estimates will be based on, but not limited to, the consideration of the best available water diversion and storage data from Water District 01, return flow monitoring, comparative years, and RISD. These estimates will establish the obligation of junior ground water users in providing water to the SWC for reasonable carryover shortfall. Fourteen (14) days following the issuance by the Department of reasonable carryover short fall obligations, junior ground water users will be required to establish, to the satisfaction of the Director, their ability to supply a volume of storage water or to conduct other approved mitigation activities that will provide water to the injured members of the SWC equal to the reasonable carryover shortfall for all injured members of the SWC. If junior ground water users cannot provide this information, the Director will issue an order curtailing junior ground water rights. A transient ESPAM simulation will be run to determine the priority date of water rights that must be curtailed to produce the reasonable carryover shortfall volume by September 30 of the following year. Curtailment will be simulated within the area of common ground water supply, as described by CM Rule 50.01.

IT IS FURTHER ORDERED that this Sixth Methodology Order supersedes all previously issued methodology orders in this matter.

Dated this 19th day of July 2023.

GARY SPACKMAN
Director

EXPLANATORY INFORMATION TO ACCOMPANY A FINAL ORDER

(Required by Rule of Procedure 740.02)

The accompanying order is a "**Final Order**" issued by the department pursuant to section 67-5246 or 67-5247, Idaho Code.

Section 67-5246 provides as follows:

(1) If the presiding officer is the agency head, the presiding officer shall issue a final order.

(2) If the presiding officer issued a recommended order, the agency head shall issue a final order following review of that recommended order.

(3) If the presiding officer issued a preliminary order, that order becomes a final order unless it is reviewed as required in section 67-5245, Idaho Code. If the preliminary order is reviewed, the agency head shall issue a final order.

(4) Unless otherwise provided by statute or rule, any party may file a petition for reconsideration of any order issued by the agency head within fourteen (14) days of the service date of that order. The agency head shall issue a written order disposing of the petition. The petition is deemed denied if the agency head does not dispose of it within twenty-one (21) days after the filing of the petition.

(5) Unless a different date is stated in a final order, the order is effective fourteen (14) days after its service date if a party has not filed a petition for reconsideration. If a party has filed a petition for reconsideration with the agency head, the final order becomes effective when:

(a) The petition for reconsideration is disposed of; or
(b) The petition is deemed denied because the agency head did not dispose of the petition within twenty-one (21) days.

(6) A party may not be required to comply with a final order unless the party has been served with or has actual knowledge of the order. If the order is mailed to the last known address of a party, the service is deemed to be sufficient.

(7) A non-party shall not be required to comply with a final order unless the agency has made the order available for public inspection or the nonparty has actual knowledge of the order.

(8) The provisions of this section do not preclude an agency from taking immediate action to protect the public interest in accordance with the provisions of section 67-5247, Idaho Code.

PETITION FOR RECONSIDERATION

Any party may file a petition for reconsideration of a final order within fourteen (14) days of the service date of this order as shown on the certificate of service. **Note: the petition must be received by the Department within this fourteen (14) day period.** The department will act on a petition for reconsideration within twenty-one (21) days of its receipt, or the petition will be considered denied by operation of law. See section 67-5246(4) Idaho Code.

APPEAL OF FINAL ORDER TO DISTRICT COURT

Pursuant to sections 67-5270 and 67-5272, Idaho Code, any party aggrieved by a final order or orders previously issued in a matter before the department may appeal the final order and all previously issued orders in the matter to district court by filing a petition in the district court of the county in which:

i. A hearing was held,
ii. The final agency action was taken,
iii. The party seeking review of the order resides, or
iv. The real property or personal property that was the subject of the agency action is located.

The appeal must be filed within twenty-eight (28) days: a) of the service date of the final order, b) the service date of an order denying petition for reconsideration, or c) the failure within twenty-one (21) days to grant or deny a petition for reconsideration, whichever is later. See section 67-5273, Idaho Code. The filing of an appeal to district court does not in itself stay the effectiveness or enforcement of the order under appeal.

BEFORE THE DEPARTMENT OF WATER RESOURCES

OF THE STATE OF IDAHO

IN THE MATTER OF THE DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY AND FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **ORDER REVISING APRIL 2023 FORECAST SUPPLY AND AMENDING CURTAILMENT ORDER** **(*METHODOLOGY STEPS 5 & 6*)**

The Director of the Idaho Department of Water Resources ("Department") finds, concludes, and orders as follows:

FINDINGS OF FACT

A. Background

1. On July 19, 2023, the Director issued the *Sixth Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* ("Methodology Order"). The Methodology Order established nine steps for determining material injury to members of the Surface Water Coalition ("SWC"). This order applies Steps 5 and 6 to the 2023 irrigation season.

2. On November 30, 2022, the Director issued the *Final Order Establishing 2022 Reasonable Carryover – Methodology Step 9* ("November Carryover Order") establishing a reasonable carryover shortfall of 49,309 AF. The Director ordered junior ground water users holding consumptive ground water rights within the Eastern Snake Plain Aquifer ("ESPA") area of common ground water supply with priority dates junior to May 31, 1989, to mitigate for their proportionate share of the reasonable carryover shortfall or be curtailed. *November Carryover Order* at 6.

3. On April 21, 2023, the Director issued his *Final Order Regarding April 2023 Forecast Supply (Methodology Steps 1 – 3)* ("April Forecast Supply Order"). The April Forecast Supply Order predicted a demand shortfall to the SWC of 75,200 acre-feet for the 2023 irrigation season. *April Forecast Supply Order* at 3. At that time, the only member of the SWC predicted to experience material injury during the 2023 irrigation season was the Twin Falls Canal Company ("TFCC"). The Director ordered that, by May 5, 2023, ground water users with consumptive water rights "junior to December 30, 1953, within the Eastern Snake Plain Aquifer area of common ground water supply shall establish, to the satisfaction of the Director, that they can mitigate for their proportionate share of the predicted [demand shortfall] of 75,200 acre-feet in accordance with an approved mitigation plan . . . ." *Id.* at 5. The Director also ordered that, if

a junior ground water user cannot establish they can mitigate for their proportionate share of the predicted demand shortfall in accordance with an approved mitigation plan, "the Director will issue an order curtailing the junior-priority ground water user." *Id.* However, on May 1, 2023, the Director sent notice to affected water users that a hearing on the April Forecast Supply Order would be held June 6–10, 2023, and the Director would wait until after the hearing to decide whether to issue a curtailment order.

4. Step 5 of the Methodology Order addresses the final injury determination to reasonable carryover for members of the SWC. "If the storage allocations held by members of the SWC fill, there is no reasonable carryover shortfall." *Methodology Order* at 43. On July 13, 2023, the Water District 01 published its 2023 Preliminary Storage Report ("Storage Report").[1] The Storage Report stated that TFCC had 1,088 acre-feet of last to fill (i.e., LTF) that did not fill. TFCC has 1,088 acre-feet of LTF space due to its lease of 1,088 acre-feet to the Supplemental Pool in 2020. Because the LTF storage space did not fill due to a lease by TFCC, TFCC's unfilled LTF space is not considered a reasonable carryover shortfall.

5. Step 6 states:

> Approximately halfway through the irrigation season . . . the Director will, for each member of the SWC: (1) recalculate RISD [Reasonable In-Season Demand]; (2) issue a revised FS [Forecast Supply]; and (3) estimate the Time of Need date.

Id. (footnote omitted).

B. April–June Climate

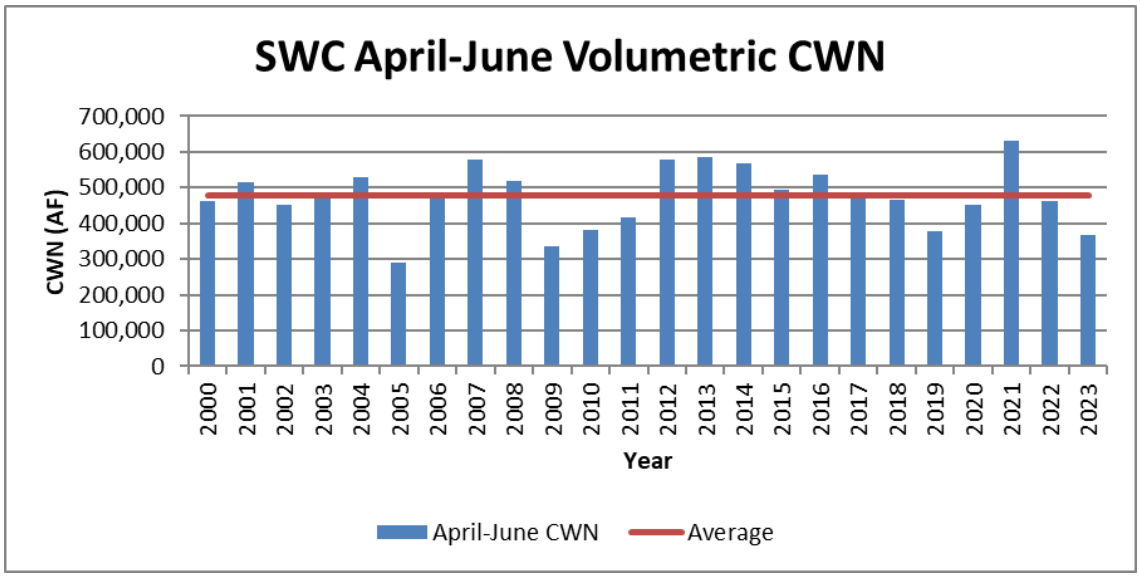
6. The April 2023 Joint Forecast prepared by the United States Army Corps of Engineers and the United States Bureau of Reclamation ("BOR") predicted 3,700,000 acre-feet of natural flow at the Heise gage for the period of April through July 2023. *April Forecast Supply Order* at 2. The Joint Forecast "is generally as accurate a forecast as is possible using current data gathering and forecasting techniques." *Methodology Order* at 19 (citation omitted).

7. Spring precipitation (April–June) was variable. According to Natural Resource Conservation Service SNOTEL sites, the Upper Snake received 96%, 64%, and 179% of average precipitation in April, May, and June, respectively. The National Weather Service's Twin Falls weather station reported 20%, 132%, 79% of normal precipitation in April, May, and June, respectively. Temperatures reported by the Twin Falls weather station were -1.6 degrees below normal for April, 4.1 degrees above normal for May, and -0.6 degrees below normal for June.[2]

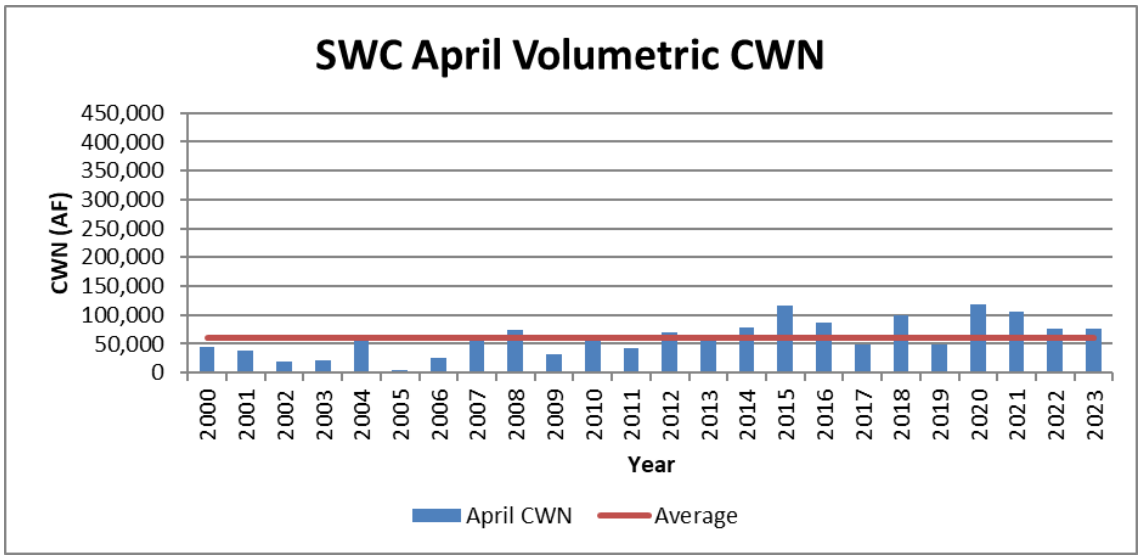
[1] The *2023 Preliminary Storage Report* can be viewed on-line at the following link: https://www.waterdistrict1.com/media/5piix3cc/2023-prelim-storage-report.pdf .

[2] Precipitation and temperature data obtained from the NOAA National Weather Service Preliminary Monthly Climate Data for the Twin Falls 3SE weather station (Twin Falls Airport).

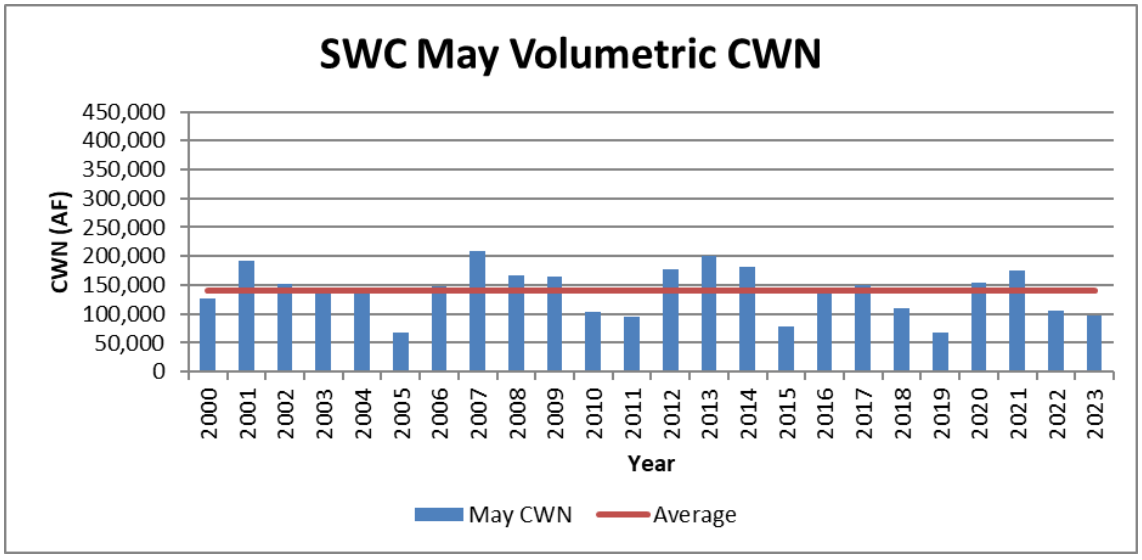
C. Reasonable In-Season Demand



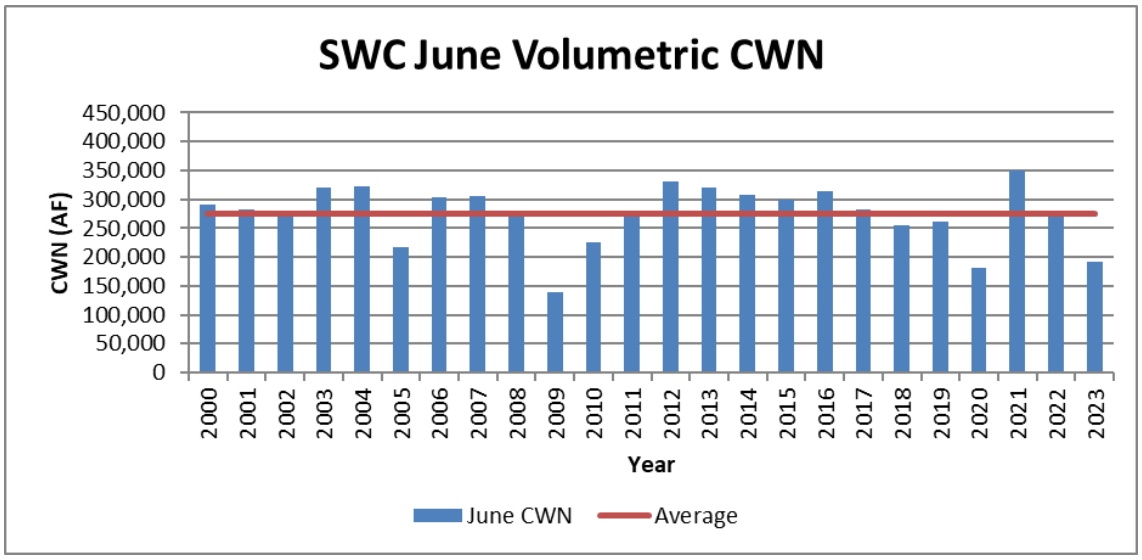
8. RISD "is the projected annual diversion volume for each SWC entity during the year of evaluation that is attributable to the projected beneficial use of growing crops within the service area of the entity." *Methodology Order* at 13. In April, the demand from the 2018 BLY defines the RISD. *Id.* at 17. During the irrigation season, the RISD for the completed portion of the irrigation season is recalculated by dividing the actual crop water need ("CWN") for each entity by the project efficiency for that entity. *Id.* at 17, 43. For the remainder of the irrigation season, the RISD is the demand defined by the July–October 2018 BLY. *Id.* RISD is calculated on a monthly time step.



i. Crop Water Need



9. "CWN is the volume of irrigation water required for crop growth within a SWC entity boundary, such that crop growth is not limited by water availability." *Methodology Order* at 15. CWN is the difference between the fully realized consumptive use associated with crop growth, or [evapotranspiration], and effective precipitation . . . ." *Id.*



10. CWN is an input variable for calculating RISD for the completed portion of the irrigation season. *Id.* at 17. Actual RISD for the completed portion of the irrigation season is combined with monthly predicted baseline demands for the remaining months of the irrigation season to calculate a season-total RISD volume. *Id.* at 17-18. In-season demand shortfall is then calculated as the difference between the adjusted FS and the RISD. *Id.* at 23.

11. As calculated from the beginning of the irrigation season (April 1), the SWC's volumetric CWN for the current water year through the month of June is 367,222 acre-feet. This volume is 73% of the April 1–June 30 ten-year average CWN (2013–2022) and 79% of the April 1–June 30 CWN for the 2018 BLY. The following graphs summarize monthly volumetric CWN values:

SWC April Volumetric CWN

ii. Extension of BLY

12. The RISD for the remaining portion of the irrigation season (July–October) is the July–October demand for 2018 BLY. The numeric values are shown in the table in Finding of Fact 13 below.

iii. Calculation of RISD

13. As calculated from the beginning of the irrigation season (April 1), the SWC's volumetric RISD for 2023 through the month of June is 991,737 acre-feet. This volume is 72% of the April 1–June 30 ten-year average RISD (2013–2022) and 70% of the April–June demand for the 2018 BLY. The recalculated RISD at this point of the 2023 irrigation season by entity is:

	April–June CWN (AF)	E_p (April - June)	April–June RISD (AF)	July–October Demand for 2018 BLY (AF)	Recalculated RISD (AF)
A&B	8,872	0.46-1.05	15,093	38,528	53,622
AFRD2	41,551	0.22-0.40	129,884	274,485	404,369
BID	31,241	0.31-0.49	78,538	145,546	224,085
Milner	8,578	0.38-0.87	15,353	36,432	51,786
Minidoka	58,753	0.35-0.55	131,152	196,968	328,121
NSCC	86,283	0.23-0.41	278,976	594,099	873,075
TFCC	131,944	0.29-0.51	342,740	653,473	996,214

D. Forecast Supply

14. When determined during the irrigation season, the FS is the sum of the actual natural flow supply from April through June, the predicted natural flow supply from July through

October, and the actual storage allocations. *Methodology Order* at 43. Actual natural flow diversions for the completed portion of the irrigation season are extracted from the Department's water rights accounting program. The natural flow diversions for the remainder of the irrigation season are estimated by regression analysis. *Id.* at 20–21, 43. Storage allocations are determined by Water District 01 after the Day of Allocation. *Id.* at 43.

i. Sum of Actual Natural Flow Diverted

15. Actual natural flow diverted in April through June for each SWC member is shown in the table contained in Finding of Fact 25 below, within the "Summary of Forecast Supply" section.

ii. Regression Models to Predict Natural Flow (July–October)

16. Natural flow diversions were predicted for the remainder of the irrigation season by regression analysis. The Methodology Order established the following variables as predictor variables in the regression models: natural flow in the Snake River near Heise as reported by the BOR, snow water equivalent ("SWE") data at Two Ocean Plateau SNOTEL site, Spring Creek discharge, and groundwater levels near American Falls Reservoir. *Methodology Order* at 20–21. Unique regression models with unique predictor variable groups are established in the Methodology Order for each SWC member.

17. Either June 15 or July 1 SWE values for the Two Ocean Plateau SNOTEL site are used as input variables in each of the regression models developed in the Methodology Order. Two Ocean Plateau SWE data was selected as a predictor variable in the Methodology Order based upon step-wise statistical analysis carried out in the development of each regression model. The Two Ocean Plateau SWE data is an optimum predictor variable for several reasons including: its elevation (the site is located above 9,000 ft and typically still has snow late in the runoff season (June 15 and July 1); its location (the site is in the headwaters of the Snake River above Jackson Reservoir); and its period of record, which is sufficiently long enough to support model development.

18. On July 1, 2023 the Two Ocean Plateau SNOTEL station reported 0.0 inches of SWE. When the snow water equivalent is zero on July 1, the predicted natural flow supplies for the period July 1–October 31 for A&B, AFRD2, and Milner are zero acre-feet. *Methodology Order* at 20.

19. The input variables used to predict the July–October natural flow volumes for BID, Minidoka, and NSCC in 2023 include: (1) 4.1 inches of the SWE reported by the Two Ocean Plateau SNOTEL site on June 15, 2023; (2) 2,935,356 acre-feet of natural flow runoff at the Snake River near Heise (April–June) as reported by the BOR; and (3) 27.61 feet depth to water at well 5S31E27ABA1 as measured by the Department on March 23,2023.

20. The input variables used to predict the July–October natural flow volumes for TFCC in 2023 include: (1) 4.1 inches of the SWE reported by the Two Ocean Plateau SNOTEL site on June 15, (2) 2,935,356 acre-feet of natural flow runoff at the Snake River near Heise

(April–June) as reported by the BOR, and (3) 76,428 acre-feet total discharge at Spring Creek (January–May) as measured and reported by the United States Geologic Survey for its *Spring Creek at Sheepskin Rd Nr Fort Hall ID* Gage (Gage No. 13075983).

iii. Storage Allocations

21. The preliminary storage allocations identified by Water District 01 in the Storage Report for each of the SWC members are reported in the table in Finding of Fact 23 below.

iv. Adjustments to Total Supply

22. The natural flow and storage water supplies were both adjusted as shown in the table in Finding of Fact 23 below. Adjustments to natural flow include wheeled water to Southwest Irrigation District through BID and Milner, 3,714 acre-feet and 3,011 acre-feet, respectively. The only adjustments to the stored water supply in the table below were for the Minidoka Credit. Water supplied to or from the rental pool was not included in the adjustments.

v. Summary of Forecast Supply

23. The following table contains the individual components of the FS for each of the SWC members:

	Natural Flow Diverted 4/1 to 6/30 (AF)	Predicted Natural Flow Diversions 7/1 to 10/31 (AF)	Natural Flow Adjustment (AF)	Preliminary Storage Allocation (AF)	Minidoka Credit Adjustment (AF)	FS (AF)
A&B	15,545	0	0	132,888	0	148,436
AFRD2	148,717	0	0	382,422	1,000	532,147
BID	105,323	10,972	(3,714)	220,083	5,130	337,799
Milner	19,449	0	(3,011)	86,922	0	103,362
Minidoka	137,692	15,529	0	336,711	8,370	498,310
NSCC	395,563	83,732	0	834,545	(7,750)	1,306,091
TFCC	426,135	418,779	0	237,918	(6,750)	1,076,089

E. Revised Shortfall Projection

24. In-season demand shortfall ("IDS") is calculated as the difference between RISD and the FS.

25. Based on the above, and as summarized in the table below, the Director predicts no mid-season IDS to the SWC.

	FS (AF)	RISD (AF)	Shortfall (AF)
A&B	148,436	53,622	0
AFRD2	532,147	404,369	0
BID	337,799	224,085	0
Milner	103,362	51,786	0
Minidoka	498,310	328,121	0
NSCC	1,306,091	873,075	0
TFCC	1,076,089	996,214	0
		Total	0

F. Time of Need

26. Step 5 of the Methodology Order requires that the Director estimate the Time of Need if there is water owed to SWC members that is in addition to the reasonable carryover shortfall volume. *Methodology Order* at 43. As stated in Finding of Fact 4, there is no reasonable carryover shortfall. Execution of Step 6 demonstrates there is no mid-season IDS to the SWC for 2023. With no additional water owed to SWC members, there is no need to establish a Time of Need as described in Step 6.

CONCLUSIONS OF LAW

1. Idaho Code § 42-602 authorizes the Director to supervise water distribution within water districts:

> The director of the department of water resources shall have direction and control of the distribution of water from all natural water sources within a water district to the canals, ditches, pumps and other facilities diverting therefrom. Distribution of water within water districts created pursuant to section 42-604, Idaho Code, shall be accomplished by watermasters as provided in this chapter and supervised by the director. The director of the department of water resources shall distribute water in water districts in accordance with the prior appropriation doctrine. The provisions of chapter 6, title 42, Idaho Code, shall apply only to distribution of water within a water district.

2. Idaho Code § 42-607 states that the watermaster, under the direction of the Director, shall regulate diversions "when in times of scarcity of water it is necessary so to do in order to supply the prior rights of others in such stream or water supply . . . ."

3. Step 5 of the Methodology Order requires that the Director estimate the Time of Need if there is water owed to the SWC members that is in addition to the reasonable carryover shortfall volume. *Methodology Order* at 43. No member of the SWC is owed reasonable

carryover in 2023 for a reasonable carryover shortfall determined in 2022. Execution of Step 6 of the Methodology Order demonstrates there is no mid-season IDS to the SWC for 2023. With no additional water owed to SWC members, there is no need to establish a Time of Need as described in Step 6.

ORDER

Based upon and consistent with the foregoing, IT IS HEREBY ORDERED that there is no mid-season in-season demand shortfall to the SWC members.

Dated this 19th day of July 2023.

GARY SPACKMAN
Director

CERTIFICATE OF SERVICE

I HEREBY CERTIFY that on this 19th day of July 2023, the above and foregoing, was served by the method indicated below, and addressed to the following:

EXPLANATORY INFORMATION TO ACCOMPANY A FINAL ORDER

(To be used in connection with actions when a hearing was **not** held)

(Required by Rule of Procedure 740.02)

The accompanying order is a "**Final Order**" issued by the department pursuant to section 67-5246, Idaho Code.

PETITION FOR RECONSIDERATION

Any party may file a petition for reconsideration of a final order within fourteen (14) days of the service date of this order as shown on the certificate of service. **Note: The petition must be received by the Department within this fourteen (14) day period.** The department will act on a petition for reconsideration within twenty-one (21) days of its receipt, or the petition will be considered denied by operation of law. See section 67-5246(4), Idaho Code.

REQUEST FOR HEARING

Unless the right to a hearing before the director or the water resource board is otherwise provided by statute, any person who is aggrieved by the action of the director, and who has not previously been afforded an opportunity for a hearing on the matter shall be entitled to a hearing before the director to contest the action. The person shall file with the director, within fifteen (15) days after receipt of written notice of the action issued by the director, or receipt of actual notice, a written petition stating the grounds for contesting the action by the director and requesting a hearing. See section 42-1701A(3), Idaho Code. **Note: The request must be received by the Department within this fifteen (15) day period.**

APPEAL OF FINAL ORDER TO DISTRICT COURT

Pursuant to sections 67-5270 and 67-5272, Idaho Code, any party aggrieved by a final order or orders previously issued in a matter before the department may appeal the final order and all previously issued orders in the matter to district court by filing a petition in the district court of the county in which:

i. A hearing was held,
ii. The final agency action was taken,
iii. The party seeking review of the order resides, or
iv. The real property or personal property that was the subject of the agency action is located.

The appeal must be filed within twenty-eight (28) days of: a) the service date of the final order, b) the service date of an order denying petition for reconsideration, or c) the failure within twenty-one (21) days to grant or deny a petition for reconsideration, whichever is later. See section 67-5273, Idaho Code. The filing of an appeal to district court does not in itself stay the effectiveness or enforcement of the order under appeal.

Revised July 1, 2010

BEFORE THE DEPARTMENT OF WATER RESOURCES

OF THE STATE OF IDAHO

IN THE MATTER OF DISTRIBUTION OF WATER TO VARIOUS WATER RIGHTS HELD BY OR FOR THE BENEFIT OF A&B IRRIGATION DISTRICT, AMERICAN FALLS RESERVOIR DISTRICT #2, BURLEY IRRIGATION DISTRICT, MILNER IRRIGATION DISTRICT, MINIDOKA IRRIGATION DISTRICT, NORTH SIDE CANAL COMPANY, AND TWIN FALLS CANAL COMPANY	Docket No. CM-DC-2010-001 **POST-HEARING ORDER REGARDING FIFTH AMENDED METHODOLOGY ORDER**

On April 21, 2023, the Director of the Idaho Department of Water Resources ("Department") issued the *Fifth Amended Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover* ("Fifth Methodology Order") as well as the *Final Order Regarding April 2023 Forecast Supply* ("2023 As-Applied Order"). A hearing on these orders was held June 6–9, 2023. In this *Post-Hearing Order Regarding Fifth Amended Methodology Order*, the Director affirms the Fifth Methodology Order with a few modifications. Because there are some modifications, the Director simultaneously issues with this order a *Sixth Final Order Regarding Methodology for Determining Material Injury to Reasonable In-Season Demand and Reasonable Carryover*.

BACKGROUND

A. General History of the Surface Water Coalition Delivery Call

In January of 2005, various holders of senior priority surface water rights authorizing diversion of water from the Snake River and tributary springs filed or joined in a delivery call against holders of junior priority ground water rights pursuant to the Department's Rules for Conjunctive Management of Surface and Ground Water Resources ("CM Rules"). In response to the delivery call, on May 2, 2005, then-Director Karl Dreher issued an order, which determined that water shortages were reasonably likely in 2005 and would materially injure the holders of senior priority surface water rights. Am. Order at 44, *In re Distribution of Water to Various Water Rights Held By or For the Benefit of A&B Irr. Dist., Am. Falls Reservoir Dist. No. 2, Burley Irr. Dist., Milner Irr. Dist., Minidoka Irr. Dist., North Side Canal Co., & Twin Falls Canal Co.* (Idaho Dep't of Water Res. May 2, 2005).

In response to Director Dreher's order, on August 15, 2005, the holders of senior surface water rights filed a declaratory judgment action in district court, challenging, among other subjects, the constitutionality of the CM Rules. The holders of senior surface water rights requested stays and continuances in a scheduled administrative hearing, and the action for declaratory judgment was heard by the district court. The district court issued its decision on summary judgment on June 2, 2006, finding that the CM Rules were facially unconstitutional.

Order on Pls.' Mot. for Summ. J., at 105, *Am. Falls Reservoir Dist. No. 2 v. Idaho Dep't of Water Res.*, No. CV-2005-600 (Gooding Cnty. Dist. Ct. Idaho June 2, 2006).

The decision by the district court was appealed to the Idaho Supreme Court. On appeal, the Idaho Supreme Court issued an opinion determining that the CM Rules were facially constitutional. *Am. Falls Reservoir Dist. No. 2 v. Idaho Dept. of Water Res.*, 143 Idaho 862, 882–83, 154 P.3d 433, 453–54 (2007).

The Idaho Supreme Court outlined processes for the Director to constitutionally apply the CM Rules and also assigned the burdens borne by the holders of senior surface water rights, junior ground water rights, and the Department. In outlining the acceptable "as-applied" processes, the Idaho Supreme Court stated:

> The [CM] Rules should not be read as containing a burden-shifting provision to make the petitioner re-prove or re-adjudicate the right which he already has . . . . [T]he burden is not on the senior water rights holder to re-prove an adjudicated right. The presumption under Idaho law is that the senior is entitled to his decreed water right . . . .

Am. Falls Reservoir Dist. No. 2, 143 Idaho at 877–78, 154 P.3d at 448–49.

Despite the presumption, the Court stated:

> [T]here certainly may be some post-adjudication factors which are relevant to the determination of how much water is actually needed. The [CM] Rules may not be applied in such a way as to force the senior to demonstrate an entitlement to the water in the first place; that is presumed by the filing of a petition containing information about the decreed right. The [CM] Rules do give the Director the tools by which to determine "how the various ground and surface water sources are interconnected, and how, when, where and to what extent the diversion and use of water from one source impacts [others]." *A & B Irrigation Dist.,* 131 Idaho at 422, 958 P.2d at 579. Once the initial determination is made that material injury is occurring or will occur, the junior then bears the burden of proving that the call would be futile or to challenge, in some other constitutionally permissible way, the senior's call.

Id. at 878, 154 P.3d at 449.

After the Idaho Supreme Court's decision in *American Falls Reservoir District No. 2*, then-Director David Tuthill issued an Order appointing retired Idaho Supreme Court Chief Justice Gerald Schroeder to serve as a hearing officer for the administrative hearing. The hearing began on January 18, 2008, and ended February 5, 2008.

On April 29, 2008, Hearing Officer Schroeder issued his decision which recommended among other things that the Director establish a baseline for predicting the water needs of senior surface water users, which was necessary for projecting material injury. *Opinion Constituting*

Findings of Fact, Conclusions of Law and Recommendations at 51. On September 5, 2008, the Director issued his *Final Order Regarding the Surface Water Coalition Delivery Call,* adopting most of the hearing officer's findings and recommendations.

The order was appealed to district court and eventually appealed to the Idaho Supreme Court, which determined the Director had constitutionally "applied" the CM Rules. *In Matter of Distribution of Water to Various Water Rts. Held By or For Ben. of A & B Irr. Dist.,* 155 Idaho 640, 647, 315 P.3d 828, 835 (2013). The Court also held it was proper for the Director to use a baseline year to predict and quantify material injury, and that the initial determination of material injury must depend on "how the various ground and surface water sources are interconnected, and how, when, where and to what extent the diversion and use of water from one source impacts others." *Id.* at 652–53, 315 P.3d at 840 (internal citations and quotations omitted). Finally, the Court affirmed the district court's determination that the clear and convincing evidence standard is to be applied in determining material injury when a decreed senior priority water right is being evaluated for reduction. *Id*.

The Idaho Supreme was clear, however, that because the district court had not reviewed the findings of fact that shaped the methodology nor any modifications to the methodology order, those issues were not properly before the Court. *Id.* at 649, 315 P.3d at 837.

On September 26, 2014, the district court issued its *Memorandum Decision and Order on Petitions for Judicial Review*, wherein Judge Wildman squarely addressed the findings of fact shaping the methodology as well as the modifications to the methodology order. Mem. Decision & Order on Pets. for Judicial Review, *Idaho Ground Water Appropriators, Inc. v. Spackman*, No. CV-2010-382 (Gooding Cnty. Dist. Ct. Idaho Sep. 26, 2014) [hereinafter 2014 District Court Order]. Judge Wildman largely upheld the factual basis underlying the Department's methodology and as-applied orders, but remanded certain portions for further consideration. The groundwater users initially noticed their intent to appeal the 2014 District Court Order, but later filed a motion to withdraw, which the Idaho Supreme Court granted on January 23, 2015. Judge Wildman's 2014 District Court Order will be addressed in detail throughout this order.

B. History of the Fifth Methodology Order

The Director issued the Fifth Methodology Order as well as the 2023 As-Applied Order on April 21, 2023. The Fifth Methodology Order revised the nine steps used to determine material injury to members of the SWC. The 2023 As-Applied Order predicted a shortfall for the 2023 irrigation season, which required appropriators with water rights junior to December 30, 1953, to mitigate or curtail.

Anticipating that one or more parties would request a hearing pursuant to Idaho Code § 42-1701A(3) in response to one or both orders, the Director issued a *Notice of Hearing, Notice of Prehearing Conference, and Order Authorizing Discovery* ("Notice of Hearing") on April 21, 2023. The Notice of Hearing scheduled a prehearing conference for April 28, 2023, and an in-person evidentiary hearing on the Fifth Methodology Order and 2023 As-Applied Order for June 6–10, 2023.

Immediately before the April 28, 2023 prehearing conference, the Cities of Bliss, Burley, Carey, Declo, Dietrich, Gooding, Hazelton, Heyburn, Idaho Falls, Jerome, Paul, Pocatello, Richfield, Rupert, Shoshone, and Wendell (collectively the "Cities") filed a *Motion for Continuance* ("Motion to Continue") requesting that the Director continue the June 6–10 evidentiary hearing "until a date in December or January 2024 . . . ." *Motion to Continue* at 8.

During the April 28, 2023 prehearing conference, the Cities presented argument in support of their Motion to Continue. The Idaho Ground Water Appropriators, Inc. ("IGWA"), Bonneville-Jefferson Groundwater District ("BJGWD"), and McCain Foods orally moved to join the Cities' Motion to Continue. The Cities requested that the hearing, currently scheduled for June 6–10, 2023, be delayed approximately six months. *Motion to Continue* at 8. The Cities asserted additional time was needed to conduct discovery, prepare witnesses, properly evaluate the updated Fifth Methodology Order and 2023 As-Applied Order, and because one of its attorneys (Ms. Candice McHugh) would be unable to appear in person June 6–10. *Id*. at 4–6. The Cities further asserted the Director should grant its request because no exigency exists given the above-average snowfall this year. *Id*. at 6–8. The SWC opposed the Cities' motion, arguing the hearing should remain as scheduled on June 6–10, 2023.

The Director orally denied the Cities' request to continue the hearing until December or January 2024. The Director stated he was, however, willing to hold the hearing anytime within the first three weeks of June 2023 so long as all parties agreed to the modified dates. In denying the Cities' requested continuance, the Director emphasized his court-ordered obligation to timely predict water supplies and issue orders to ensure senior water right holders are protected.

On May 5, 2023, the Director issued an *Order Denying the Cities' Motion for Appointment of Independent Hearing Officer and Motion for Continuance and Limiting Scope of Depositions* ("Order Denying Motion to Continue & Limiting Scope of Depositions"). In the order, the Director memorialized his oral denial of the Motion to Continue, but reiterated he was willing to move the hearing within the first three weeks of June 2023, so long as the parties filed a stipulated motion requesting the change. *Order Denying Motion to Continue & Limiting Scope of Depositions* at 2. The Director also ordered that the depositions of Department staff be limited "to preclude questions regarding the Director's deliberative process on legal and policy considerations" pursuant to IDAPA 37.01.01.521. *Id*. at 3. By separate order, the Director authorized Ms. McHugh to appear at the hearing remotely. Scheduling Order & Order Authorizing Remote Appearance at Hr'g at 3.

On May 5, 2023, the Cities, along with IGWA, BJGD, and Bingham Groundwater District (collectively the "Groundwater Users") filed a *Motion for Reconsideration of Denial of Continuance* ("Motion to Reconsider") requesting that the Director reconsider his order denying the Groundwater Users' request to continue the hearing. The Groundwater Users further argued that the June 6–10 hearing should be continued due to the unavailability of numerous witnesses and an attorney. *Motion to Reconsider* at 3–5. The Groundwater Users also claimed that a failure to continue the hearing would result in prejudice to the Groundwater Users. *Id.* at 5.

On May 8, 2023, the SWC filed *Surface Water Coalition's Opposition to Groundwater Users' Motion for Reconsideration of Order Denying Motion for Continuance* ("Objection to

Motion to Reconsider"). The SWC pointed out that the Department has already authorized Ms. McHugh to appear remotely to accommodate her travel, and that the SWC would stipulate to IGWA's expert witnesses, Sophia Sigstedt's, appearing remotely to accommodate her medical condition. *Objection to Motion to Reconsider* at 8–9 n.8. The SWC further argued that 6 weeks was plenty of time to prepare for a hearing, as evidenced by the fact that the First Methodology Order in this exact case was issued on April 7, 2010, with an evidentiary hearing held approximately six weeks later on May 24, 2010. *Id.* at 7–8. The SWC further argued that this type of scheduling in a conjunctive management administration should surprise no one. *Id*. Most importantly, the SWC argued they would be prejudiced were the hearing to be continued. *Id.* at 10.

On May 19, 2023, the Director issued his *Order Denying Motion for Reconsideration of Denial of Continuance* ("Order Denying Motion to Reconsider"). In denying the Groundwater Users motion, the Director expressed that, like the SWC, he was skeptical of the Groundwater Users contention that they had secured sufficient mitigation to ensure seniors would not be injured. *Order Denying Motion to Reconsider* at 5–6. The Director further emphasized his legal responsibility to timely respond to injury incurred by senior water users. *Id.* at 6 (citing *Am. Falls Reservoir Dist. No. 2,* 143 Idaho at 874, 154 P.3d at 445).

Also on May 19, 2023, the Cities, BJGWD, Bingham Groundwater District ("BGWD"), and McCain Foods filed in district court a *Complaint for Declaratory Relief, Petition for Writ of Prohibition, and Petition for Writ of Mandamus* ("Complaint & Petition") as well as a motion for order to show cause. On the same day, IGWA filed in district court a petition for judicial review along with a variety of motions including a motion to stay, a motion for injunctive relief, motion to compel, motion for order to show cause, and a motion for expedited decision. The purpose of the Groundwater Users' various petitions and motions was the same; they were an attempt to persuade the district court to step in and stop the administrative hearing set for June 6–10, 2023.

On June 1, 2023, the district court held a 3.5-hour hearing on the Ground Water Users' various petitions and motions. At the conclusion of the hearing the court ruled from the bench and orally dismissed the Cities writ applications and IGWA's petition for judicial review, and also denied the various other motions filed by the Groundwater Users.[1] The court reiterated that the Groundwater Users grievances have already been addressed in numerous previous cases:

> And I'm going to add one final conclusion here. You know, after reviewing the issues raised in these cases and preparing for these hearings, as I had mentioned earlier, I went back and reviewed the numerous opinions that have been addressed by this Court where substantially the same if not the same issues were raised in the context of conjunctive management delivery calls, including this same delivery call brought by the Surface Water Coalition. The issues are not new, and my reading of the prior decisions explicitly sets forth and reiterates the overriding principles that govern these types of matters. And I'm aware in every single one of those, parties attempt to distinguish that particular set of circumstances to justify the requirement

[1] On June 7, 2023, the Cities filed a motion to voluntarily dismiss their remaining complaint for declaratory relief, which the district court granted on June 14, 2023.

> of exhausting administrative remedies. But the issues raised -- and based on my review, the issues raised today in these cases are no different. And these include that the director's statutorily charged with administering water in priority; time is of the essence in responding to delivery calls; the director must act quickly to avoid injury to senior rights; due process is required but must account for the exigencies of the circumstances; the director has discretion in limiting the scope and timing of the hearings; and unless a statute or rule otherwise provides for a hearing, the director may issue an order and conduct a hearing after issuance of the order.

Excerpt from Hr'g on Admin. Appeals (Court's Ruling) Tr., at 11–12, *City of Pocatello v. Idaho Dep't of Water Res.*, No. CV01-23-08258 (Ada Cnty. Dist. Ct. Idaho June 1, 2023).

The previously scheduled administrative hearing began on June 6, 2023. The hearing was scheduled for five days but was completed in four. Prior to the hearing, the Department posted to its publicly available website the materials Department staff might rely upon at the hearing. The Director took official notice of the documents as authorized under the Department's Procedural Rule 602 (IDAPA 37.01.01.602). At the conclusion of the hearing, the Director requested that the parties submit post-hearing briefing by June 16, 2023. The parties submitted post-hearing briefs.

APPLICABLE LAW

1. "The agency's experience, technical competence, and specialized knowledge may be utilized in the evaluation of the evidence." Idaho Code § 67-5251(5); IDAPA 37.01.01.600.

2. The conjunctive management rules "give the Director the tools by which to determine 'how the various ground and surface water sources are interconnected, and how, when, where and to what extent the diversion and use of water from one source impacts . . . other sources.'" *A & B Irr. Dist. v. Idaho Conservation League*, 131 Idaho 411, 422, 958 P.2d 568, 579 (1997).

3. CM Rule 42.01 lists factors the Director may consider when determining whether senior irrigation water right holders are suffering material injury and using water efficiently and without waste:

> a. The amount of water available in the source from which the water right is diverted.
>
> b. The effort or expense of the holder of the water right to divert water from the source.
>
> c. Whether the exercise of junior-priority ground water rights individually or collectively affects the quantity and timing of when water is available to . . . a senior-priority surface . . . water right. This may include the seasonal as well as the multi-year and cumulative impacts of all ground water withdrawals from the area having a common ground water supply.

d. If for irrigation, the rate of diversion compared to the acreage of land served, the annual volume of water diverted, the system diversion and conveyance efficiency, and the method of irrigation water application.

e. The amount of water being diverted and used compared to the water rights.

f. The existence of water measuring and recording devices.

g. The extent to which the requirements of the holder of a senior-priority water right could be met with the user's existing facilities and water supplies by employing reasonable diversion and conveyance efficiency and conservation practices; provided, however, the holder of a surface water storage right shall be entitled to maintain a reasonable amount of carry-over storage to assure water supplies for future dry years. In determining a reasonable amount of carry-over storage water, the Director shall consider the average annual rate of fill of storage reservoirs and the average annual carry-over for prior comparable water conditions and the projected water supply for the system.

h. The extent to which the requirements of the senior-priority surface water right could be met using alternate reasonable means of diversion or alternate points of diversion, including the construction of wells or the use of existing wells to divert and use water from the area having a common ground water supply under the petitioner's surface water right priority.

IDAPA 37.03.11.042.01

4. The Rule 42.01 factors are not comprehensive. The following are additional factors the Director has considered:

- Statistical Certainty for Predicting Water Supply (Regression r^2 values)
- Field Headgate Deliveries (3/4 inch/acre vs. 5/8 inch/acre)
- Model Uncertainty
- Futile Call
- Trim Line

5. CM Rule 43.03.c outlines a variety of factors the Director may consider in determining whether a proposed mitigation plan will prevent injury to senior rights:

Whether the mitigation plan provides replacement water supplies or other appropriate compensation to the senior-priority water right when needed during a time of shortage even if the effect of pumping is spread over many years and will continue for years after pumping is curtailed. A mitigation plan may allow for multi season accounting of ground water withdrawals and provide for replacement water

> to take advantage of variability in seasonal water supply. The mitigation plan must include contingency provisions to assure protection of the senior priority right in the event the mitigation water source becomes unavailable.

IDAPA 37.03.11.043.03.c.

6. "Once a decree is presented to an administrating agency or court, all changes to that decree, permanent or temporary, must be supported by clear and convincing evidence." *A & B Irr. Dist. v. Idaho Dep't of Water Res*., 153 Idaho 500, 524, 284 P.3d 225, 249 (2012).

7. "If the Director is going to administer to less than the full amount of acres set forth on the face of the [SWC's] Partial Decrees, such a determination must be supported by clear and convincing evidence." *2014 District Court Order* at 19.

8. Clear and convincing evidence is evidence indicating that the thing to be proved is "highly probable or reasonably certain." *In re Doe*, 157 Idaho 694, 699, 339 P.3d 755, 760 (2014).

9. "It seems self–evident that to divert water from a stream or its supplies or tributaries must in a large measure diminish the volume of water in the main stream, and, where an appropriator seeks to divert water on the grounds that it does not diminish the volume in the main stream or prejudice a prior appropriator, he should . . . produce clear and convincing evidence showing that the prior appropriator would not be injured or affected by the diversion. The burden is on him to show such facts." *Josslyn v. Daly*, 15 Idaho 137, 149, 96 P. 568, 571–72 (1908) (internal citations and quotations omitted).

10. The Idaho Supreme Court has expressly admonished that, if the Director is going to administer to less than the full amount of the decree, the burden of any uncertainty must be borne by junior water users:

> In making a determination of whether or not to regulate juniors, the Director is required to evaluate whether the quantity available meets or exceeds the quantity the senior can put to beneficial use. If the Director regulates juniors to satisfy the senior's decreed quantity, there is no risk of injury to the senior. However, if the Director regulates juniors to satisfy a quantity less than decreed, there is risk to the senior that the Director's determination is incorrect. There is no remedy for the senior if the Director's determination turns out to be in error and the senior comes up short of water during the irrigation season. Any burden of this uncertainty should be borne by the junior. . . . [I]f the Director's determination is only based on a finding "more probable than not." The senior's right is put at risk and the junior is essentially accorded the benefit of uncertainty. The requisite high standard accords appropriate presumptive weight to the decree.
> . . . .
>
> It is Idaho's longstanding rule that proof of "no injury" by a junior appropriator in a water delivery call must be by clear and convincing evidence. Once a decree is

> presented to an administrating agency or court, all changes to that decree, permanent or temporary, must be supported by clear and convincing evidence.

A & B Irr. Dist., 153 Idaho at 524, 284 P.3d at 249 (internal citations and quotations omitted).

11. In responding to a delivery call under the CM Rules, the Director "may employ a baseline methodology as a starting point for considering material injury," provided the baseline methodology otherwise comports with the prior appropriation doctrine as established by Idaho law. *In re Distribution of Water to Various Water Rights Held by or for the Ben. of A&B Irr. Dist.*, 155 Idaho at 653, 315 P.3d at 841; *see also 2014 District Court Order* at 17.

12. In his 2014 District Court Order, Judge Wildman stated:

> The Director did not err in his intentional adoption of a baseline year based on above average temperatures and evapotranspiration and below average precipitation. The Court agrees that use of such data is necessary to protect senior rights if the Director is going to administer to an amount less than the full decreed quantity of the [SWC's] rights. The arguments set forth by the City of Pocatello and IGWA that the Director must use data associated with an average year fail to take into account the legal limitations placed on the Director in responding to a delivery call . . . .
> . . . .
>
> If the Director determined the needs of the [SWC] based on historic use data associated with an average year, any decision to administer to less than the full quantity of the [SWC's] decreed rights based on that data would not adequately protect its senior rights. Using data associated with an average year by its very definition would result in an under-determination of the needs of the [SWC] half of the time. The Director simply cannot rely upon such data if he is going to administer to less than the decreed quantity of the [SWC's] water rights as his analysis would not be supported by clear and convincing evidence.
> . . . .
>
> As set forth above, using data associated with an average year in order to administer to less than the full decreed quantity of the [SWC's] water rights would not meet a clear and convincing evidenced standard. Therefore, the arguments set forth by IGWA and the City of Pocatello are unavailing.

2014 District Court Order at 34.

13. Throughout the 2014 District Court Order, Judge Wildman analyzed and applied the Rule 42.01 factors referenced above and reiterated that the proper evidentiary standard is clear and convincing evidence and that the junior ground water users bear the burden of proof.

a. Reduction of Decreed Place of Use: (See Rule 42.01.d.)

Regarding a reduction of the decreed place of use (Rule 42.01.d), Judge Wildman stated:

> If the Director is going to administer to less than the full amount of acres set forth on the face of the [SWC's] *Partial Decrees,* such a determination must be supported by clear and convincing evidence. *See. e.g., A&B Irr. Dist., v. Idaho Dept. of Water Res.,* l53 Idaho 500, 524,284 P.3d 225, 249 (holding, "Once a decree is presented to an administrating agency or court, all changes to that decree, permanent or temporary, must be supported by clear and convincing evidence").

2014 District Court Order at 19.

b. Efficiency and Waste of Water (see Rule 42.01 preface and Rule 42.01.f–g):

Regarding efficiency and the waste of water (Rule 42.01 preface and Rule 42.01.f–g), Judge Wildman stated:

> [I]f the junior users believe for some reasons that the seniors will receive water they cannot beneficially use, it is their burden under the established evidentiary standards and burdens of proof to prove that fact by clear and convincing evidence. For example, the juniors may assert that the Director in their opinion is considering some, but not *all* acres that are no longer irrigated by the seniors. Or it may be their opinion that the Director is considering some, but not *the full extent* of water diverted by the seniors for use by others. In that scenario, it is then their burden under the established evidentiary standards and burdens of proof [to] get evidence supporting their position before the Director in an appropriate fashion.
> . . . .
>
> If junior users believe that administering to the full decreed amount of the [SWC's] water rights will result in waste, they must come forth with clear and convincing evidence establishing that fact. *A&B lrr. Dist.,* 153 Idaho at 524, 284 P.3d at 249.

2014 District Court Order at 31, 45 (emphasis in original).

c. Transactions of Surface Water that Could Diminish Senior Water Right Entitlement (see Rule 42.01.e):

Regarding transactions of surface water that could diminish senior water right entitlements (Rule 42.01.e), Judge Wildman stated:

> The fact that such transaction may have occurred is not . . . sufficient if the Director is going to use that data to administer to less than the full amount of the Coalition's decreed rights. *A&B Irr. Dist.,* 153 Idaho at 524, 284 P.3d at 249 (holding, "Once a decree is presented to an administrating agency or court, all changes to that decree, permanent or temporary, must be supported by clear and convincing evidence").

2014 District Court Order at 46–47.

d. Acres irrigated with supplemental ground water rights:

When determining total irrigated acreage, the Department may consider supplemental groundwater use. *Fifth Methodology Order* ¶ 23, at 10, ¶ 1, at 40.

Regarding supplemental acres, Judge Wildman stated:

> If it is established that acreage accounted for under the Coalition's senior surface water rights is being irrigated from a supplemental ground water source, that is a factor the Director has the authority to consider in the context of a delivery call. If the supplemental ground water rights being used are themselves subject to curtailment under the senior call, (as suggested may be the case here by the Hearing Officer), that factor should also be accounted for by the Director.

2014 District Court Order at 18 (internal citations and quotations omitted).

ANALYSIS

A. Hydrologic connectivity.

1. Groundwater in the ESPA is hydrologically connected to the Snake River

Rule 42.01.c authorizes the Director to determine whether pumping by junior ground water appropriators is affecting downstream senior surface water users. IDAPA 37.03.11.042.01.c; *see also Am. Falls Reservoir Dist. No. 2*, 143 Idaho at 878, 154 P.3d at 449. The conjunctive management rules "give the Director the tools by which to determine 'how the various ground and surface water sources are interconnected, and how, when, where and to what extent the diversion and use of water from one source impacts others.'" *Am. Falls Reservoir Dist. No. 2*, 143 Idaho at 878, 154 P.3d at 449 (quoting *A & B Irrigation Dist*., 131 Idaho at 422, 958 P.2d at 579).

The evaluation of the hydraulic relationship between ground water and surface water, and whether, because of an established relationship, pumping from ground water will deplete the source of water upon which the holders of senior priority surface water rights depend is not a proposed change to the decree. *Am. Falls Reservoir Dist. No. 2*, 143 Idaho at 877, 154 P.3d at 448.

The hydraulic relationship between ground water and surface water has been established in previous proceedings in this matter by expert testimony. "The surface and ground waters in the Snake River Basin are hydraulically connected, such that ground water pumping can decrease the natural flows in the Snake River and its tributaries." *In re Distribution of Water to Various Water Rights Held by or for the Ben. of A&B Irr. Dist*., 155 Idaho at 643, 315 P.3d at 831. "[G]eneral interconnection of all water in the Snake River system is well settled . . . unless the

party claiming otherwise proves by a preponderance of the evidence that the water is from a separate source." *A & B Irr. Dist.*, 131 Idaho at 421–22, 958 P.2d at 578–79. A general provision was added to each water basin in the ESPA, advising that all water rights in the Snake River Basin are connected sources to the Snake River and shall be administered conjunctively unless otherwise specifically provided.[2]

2. Quantifying Depletion

Quantifying the magnitude of the depletion caused by ground water pumping is not a change to the decree. *A & B Irr. Dist. v. Idaho Dep't of Water Res.*, 153 Idaho 500, 523, 284 P.3d 225, 248 (2012). These hydraulic relationships must be established by the preponderance of evidence, as a prerequisite, if possible, to any attempt to adjust the elements of a decreed water right.

The magnitude of the depletion on the Near Blackfoot to Minidoka Reach has previously been quantified by various ground water models for the Eastern Snake Plain Aquifer, although the magnitude of depletion on the reach has fluctuated for each new version of the ground water model. Differences in the predictions result from differences in the methods and time periods used to quantify irrigated acres, evapotranspiration, and consumptive use of ground water, along with improvements in the model representation of the near Blackfoot to Minidoka reach and changes in calibrated model parameters. Off. Noticed Doc. CurtScen22_FinalwApp, at 8, 17.[3] In ESPAM versions 1.1, 2.1, and 2.2, predictions of the depletion to the near Blackfoot to Minidoka reach caused by ground water pumping within the model boundary have ranged from approximately 860,000 to 1.2 million acre-feet per year. The predicted depletions to the near Blackfoot to Minidoka reach ranged from 42% to 46% of the modeled volume of ground water use. All three versions of the model have quantified a significant depletion to the near Blackfoot to Minidoka reach resulting from ground water pumping. Off. Noticed Doc. CurtScen22_FinalwApp, at B-2; Off. Noticed Doc. iwdl-200601, at 22.[4]

In 2022, ESPAM 2.2 predicted that the long-term junior ground water pumping within the ESPA area of common ground water supply depletes reach gains in the near Blackfoot to Minidoka reach by approximately 1.1 million acre-feet per year. Ex. 318, at 13, 21.

3. Quantifying Material Injury

Predicting and documenting whether the depletion caused by groundwater pumping is reducing the delivery of senior surface water rights is difficult because the seniors' Snake River

---

[3] Available for download at https://idwr.idaho.gov/legal-actions/delivery-call-actions/SWC/, "Materials Department Witnesses May Rely Upon at Hearing—May 5, 2023". Downloaded folder pathway: ESPAM Report\ESPAM22_Reports\Scenarios\ CurtScen22_FinalwApp.

[4] Available for download at https://idwr.idaho.gov/legal-actions/delivery-call-actions/SWC/, "Materials Department Witnesses May Rely Upon at Hearing—May 5, 2023". Downloaded folder pathways: ESPAM Report\ESPAM22_Reports\Scenarios\ CurtScen22_FinalwApp; ESPAM Report\ESPAM_Legacy_Reports\ iwdl-200601.

water supply relies on both ground water inflow (aquifer discharge entering the Snake River), as well as surface water inflow (snowpack runoff into the Snake River). Predictions of material injury must therefore include a combination of surface water runoff forecasts and surrogate ground water data for estimating ground water inflow to the Snake River.

Because of the variability in Snake River runoff and aquifer levels, the evaluation of whether ground water pumping depletions reduce the delivery and beneficial use of senior water right entitlements must be completed annually. As a result, the methodology order must simultaneously analyze the annual hydrologic data to: (1) determine whether reduced aquifer discharge to the Snake River caused by ground water pumping will result in a demand shortfall for senior water rights given the forecasted snowmelt runoff; and (2) evaluate possible reductions of senior water right elements under the clear and convincing evidence standard. Because these evaluations are concurrent in the methodology order, the Director employs safety factors when considering data that might adjust elements of the decreed senior water rights. As addressed in more detail below, these safety factors are necessary to ensure any adjustment to senior decreed water rights satisfy the requirement for clear and convincing evidence.

B. Challenges to the Fifth Methodology's Order's Method for Calculating Shortfall

Once the prerequisite hydrologic relationships have been established, the presumption is that the holder of the senior priority water right is entitled to delivery and beneficial use of the decreed water right elements, and any diminishment of the decreed elements must be proven by clear and convincing evidence. *A & B Irr. Dist*., 153 Idaho at 524, 284 P.3d at 249 (Holding that "[o]nce a decree is presented to an administrating agency or court, all changes to that decree, permanent or temporary, must be supported by clear and convincing evidence."). "If the Director is going to administer to less than the full amount of acres set forth on the face of the Coalition's Partial Decrees, such a determination must be supported by clear and convincing evidence . . . ." *2014 District Court Order*, at 19. "It is Idaho's longstanding rule that proof of 'no injury' by a junior appropriator in a water delivery call must be by clear and convincing evidence." *A & B Irr. Dist.*, 153 Idaho at 524, 284 P.3d at 249.

1. Baseline Year

A baseline year is a year or average of years when irrigation demand represents conditions that can predict need in the current year. The predicted irrigation demands of the current irrigation season are derived from the baseline year and are compared to estimated water supplies to predict material injury to senior appropriators. *Fifth Methodology Order* ¶ 7, at 3. The Idaho Supreme Court has affirmed that data from a baseline year can be used to determine reasonable in-season demand and predict material injury. *In re Distribution of Water to Various Water Rights Held by or for the Ben. of A&B Irr. Dist*., 155 Idaho at 653, 315 P.3d at 841.

The baseline year is selected by analyzing three factors: (1) climate; (2) available water supply; and (3) current irrigation practices. *Fifth Methodology Order* ¶ 8, at 3. A baseline year is selected from recent year(s) to ensure the baseline year accurately represents current irrigation practices, recent climate conditions, and a year when the senior water rights received a full supply of waters. *Fifth Methodology Order* ¶ 19, at 9, ¶ 24,

at 11. Because the baseline year data is used to *predict* reasonable in-season demand for senior appropriators, safety factors must be employed to ensure the senior water rights will be satisfied. *See 2014 District Court Order*, at 34. Safety factors include selecting a baseline year(s) with above average diversions, above average temperatures, and below average precipitation. *Fifth Methodology Order* ¶ 9, at 3. These safety factors protect the senior water rights from an underprediction of water need because, under Idaho law, a senior appropriator is presumed entitled to his or her fully decreed water right. *Am. Falls Reservoir Dist. No. 2*, 143 Idaho at 877–78, 154 P.3d at 448–49.

In previous methodology orders, no single year during the period from 2000–2014 satisfied all necessary criteria for selecting a baseline year. Off. Noticed Doc.BLYReview_2022_used for TWG_used for order, "Summary" tab.[5] For instance, one year might have been hotter than normal, resulting in greater than average evapotranspiration, but the rainfall might have been higher than normal too, disqualifying the single year. To ensure that all factors were satisfied, the Director combined several years to create an adequate safety factor to ensure senior priority surface water rights were protected.

For example, in the Fourth Methodology Order, the Department's baseline year averaged the SWC diversion volumes for 2006, 2008, and 2012 ("BLY 6/08/12"). *Fifth Methodology Order* ¶ 26, at 11. When averaged, 2006, 2008, and 2012 resulted in a baseline year diversion volume slightly above average (101%). *Fourth Methodology Order* ¶ 27, at 12. The Fourth Methodology Order averaged SWC diversion volumes for three years because no single year met all necessary criteria. *Fourth Methodology Order* ¶ 27, at 12.

For the Fifth Amended Methodology Order, the Director reviewed data from the recent years of 2014–2021. *Fifth Methodology Order* ¶ 26, at 11. Unlike in the Fourth Methodology Order, there were two years, 2018 and 2020, that satisfied all necessary criteria for a baseline year. *Compare Fourth Methodology Order* ¶ 27, at 12 *with Fifth Methodology Order* ¶ 27, at 12; *see also* Off. Noticed Doc. BLY_SWC_TWG_11-16-22, at 12.[6]

After thoroughly reviewing the data, the Director concludes that 2018 best satisfies the criteria for a baseline year. In 2018 the SWC's diversion volume was above average at 104%, ranking fourth in total diversions (from 2000–2021). *Fifth Methodology Order* ¶ 27, at 12; *see also* Off. Noticed Doc. BLYReview_2022_used for TWG_used for order, "Summary" tab.[7] A safety factor of 4% is reasonable. Additionally, 2018 had below average precipitation with above average temperatures and associated growing degree days. Year 2018 therefore satisfies all

criteria for a baseline year and sufficiently protects senior appropriators. *Fifth Methodology Order* ¶ 27, at 12.

The Ground Water Users propose averaging 2006 and 2018, which produces a diversion volume that is 101%, or just 1% above average, a percentage closer to that used in previous methodology orders. Ex. 837A, at 18; *see also Fourth Methodology Order* ¶ 27, at 12. The purpose of selecting a baseline year with diversions above average is to protect the senior surface water rights, not to select a number closest to the average diversion volume. Historical data illustrates the risk to senior appropriators when the Department selects a BLY with diversion volumes only slightly above average. The data shows that averaging SWC diversion volumes from 2006/2008/2012 for the baseline year resulted in shortfalls in four out of eight years from 2015 to 2022. Ex. 837A, at 82; see also *Fourth Methodology Order* ¶ 27, at 12.

As Judge Wildman previously advised:

> The Director did not err in his intentional adoption of a baseline year based on above average temperatures and evapotranspiration and below average precipitation. The Court agrees that use of such data is necessary to protect senior rights if the Director is going to administer to an amount less than the full decreed quantity of the Coalition's rights. The arguments set forth by the City of Pocatello and IGWA that the Director must use data associated with an average year fail to take into account the legal limitations placed on the Director in responding to a delivery call. . . .
>
> If the Director determined the needs of the Coalition based on historic use data associated with an average year, any decision to administer to less than the full quantity of the Coalition's decreed rights based on that data would not adequately protect its senior rights. Using data associated with an average year by its very definition would result in an under-determination of the needs of the Coalition half of the time. The Director simply cannot rely upon such data if he is going to administer to less than the decreed quantity of the Coalitions' water rights as his analysis would not be supported by clear and convincing evidence.

2014 District Court Order, at 33–34.

The Ground Water Users further contend selecting 2018 as the baseline year was improper "because it falls on the extreme end of the spectrum for precipitation" given that, "from 1992-2021, 2018 was the only irrigation season where there was zero precipitation from July to September." IGWA's Post-Hr'g Br., at 12.

It is true that 2018 was an outlier for lack of precipitation from July–September, and in this regard 2020 would have been a better choice. Off. Noticed Doc. BLY_SWC_TWG_11-16-

22, at 8.[8] The Director did not select 2020 as the baseline year, given the SWC's abnormally high diversion volumes of 110.5% of average. *Id*. at 17.

In sum, after thoroughly reviewing the data, the Director concludes that a safety factor of 4% is reasonable. Year 2018 best satisfies the criteria for a baseline year and sufficiently protects senior appropriators.

2. The R-Squared Value for TFCC's Natural Flow Forecast

The predictive power for accuracy of the TFCC's natural flow multi-linear model can be evaluated by the "R-squared" value on a regression line. Hr'g Tr. vol. III, at 49; Hr'g Tr. vol. I, at 186–87. The R-squared value is a statistical measurement of how closely data points fit on a regression line. Hr'g Tr. vol. I, at 186–87. R-squared values are decimal numbers that range from zero to one. The higher the decimal value, the closer the data are to the regression line, and the greater the percent of variability in the data is explained by the model. Hr'g Tr. vol. I, at 187.

The R-squared value for the TFCC's April predicted natural flow model is 0.72. Ex. 901, at 9. Department employee Matt Anders testified that this R-squared value has declined in recent years, but that the Department is still confident the regression equation is accurately predicting TFCC's natural flow. Hr'g Tr. vol. I, at 224–25.

The ground water users challenge the accuracy of TFCC's natural flow prediction and imply that TFCC's 0.72 R-squared is evidence that the Department's TFCC natural flow forecast is unreliable. Hr'g Tr. vol. I, at 162-65; Hr'g Tr. vol. III, at 49–51, 187–89, 230–33; *see also* Ex. 837A at 23. While not entirely clear, the ground water users appear to believe that the Heise Gage is a poor predictor of TFCC's surface water supply given the number of tributaries that enter the Snake downstream from the Heise Gage. Hr'g Tr. vol. I, at 162-65; Hr'g Tr. vol. III, at 49–51, 187–89, 230–33.

The ground water users also appear to challenge the Department's use of ground-water-derived spring flow from Box Canyon Springs, which the ground water users appear to believe has no correlation with reach gains from the near Blackfoot to Minidoka stretch. Hr'g Tr. vol. I, at 162-65; Hr'g Tr. vol. III, at 49–51, 187–89, 230–33; *see also* Ex. 837A at 23.

The ground water users failed to offer sufficient evidence that TFCC's natural flow forecast is flawed or that TFFC's 0.72 R-squared value is unreasonable. Accordingly, the Director concludes TFFC's 0.72 R-squared value is reasonable and the TFCC's natural flow forecast is sufficiently accurate.

[8] Available for download at https://idwr.idaho.gov/legal-actions/delivery-call-actions/SWC/, "Materials Department Witnesses May Rely Upon at Hearing—May 5, 2023". Downloaded folder pathway: 2022 Technical Working Group (TWG)\Meeting 11-16-22 Methodology Overview & BLY\BYL_SWC_TWG_11-16-22.

3. Cumulative Bias

In its April shortfall calculation, the Department employs two bias or safety factors to protect senior water right holders. First, the 2018 BLY diversion volumes must be above average; and second, the forecasted natural flow supply is reduced by one standard deviation. In its July shortfall calculation, the Department employs one bias factor; the diversion volumes for July–October are above average.

The ground water users contend "[t]hese biases compound to aggressively over-predict DS. The *Fifth Methodology Order* takes the overprediction to new heights by adopting a new BLY that is much more aggressive than the BLY used in prior iterations of the Methodology Order." IGWA's Post-Hr'g Br. at 11.

The Director disagrees that the new BLY "aggressively" over-predicts demand shortfall and is "much more aggressive than the BLY used in prior iterations . . . ." As discussed in the baseline year section above, historical data indicates that the Fourth Methodology Order, which averaged diversions for 2006/2008/2012, was not biased enough to protect senior water right holders. In four out of eight years from 2015 to 2022, the April demand shortfall was *less* than the actual demand shortfall in November. Ex. 837A, at 82; see also *Fourth Methodology Order* ¶ 27, at 12. In other words, under the Fourth Methodology Order the safety factors failed to protect seniors 50% of the time.

The 2018 BLY is not anticipated to result in extreme over predictions of the SWC's demand shortfall as alleged by the ground water users. Historical data indicates that if the 2018 BLY had been used from 2015–2022, in one of eight years the April demand shortfall would have been less than the actual demand shortfall in November and in two of eight years, the July demand shortfall would have been less than the actual demand shortfall in November. *Id.*

The Director concludes that the Department's safety factors do not aggressively overpredict demand shortfall.

4. Reduction of TFCC's Decreed Place of Use

CM Rules 42.01.d–e state that, in determining whether a senior irrigator is using water efficiently yet still suffering injury, the Director may consider:

d. [T]he rate of diversion compared to the acreage of land served . . . .

e. The amount of water being diverted and used compared to the water rights.

Collectively, TFCC's natural flow Snake River water rights authorize their shareholders to irrigate 196,162 acres. Ex. 184, at 9, 13, 18; *see also* Hr'g Tr. vol. II, at 81. This 196,162-acre figure represents the number of acres TFCC irrigated in 1987 when the Snake River Basin Adjudication was commenced. Ex. 184, at 2; *see also* Hr'g Tr. vol. II, at 82. It is undisputed TFCC no longer irrigates 196,162 acres, as acreage has been removed from irrigation for various reasons. Hr'g Tr. vol. II, at 82.

TFCC concedes its members are currently irrigating no more than 194,732 acres. Ex. 4, at 1. The 194,732 irrigated acre figure is derived from a 2013 shapefile created by TFCC. *Id.* The Department used the 2013 shapefile to predict TFCC's irrigated acres for 2023. *Fifth Methodology Order* ¶ 22, at 10; *see also 2023 As-Applied Order* ¶ 3, at 1, ¶ 6, at 2; Ex. 337.

Using aerial imagery and Landsat photography from 2017, the Department's GIS staff created what has been commonly referred to as the "2017 irrigated lands dataset" (hereinafter "2017 shapefile"). Hr'g Tr. vol. II, at 68. The 2017 shapefile classified irrigated fields into three categories, irrigated, semi-irrigated, and non-irrigated. *Id.* at 68–69. The shapefile indicated that, in 2017, TFCC members irrigated 180,956 acres. Ex. 4, at 3. The purpose of the 2017 shapefile was to assist Department staff in determining TFCC's irrigation demand in 2017 for use in model calibration. Hr'g Tr. vol. II, at 68, 140–41.

The ground water users argue that, in predicting TFCC's 2023 irrigated acreage, the Director should rely on the Department's 2017 shapefile—not the 2013 shapefile created by TFCC. IGWA's Post-Hr'g Br., at 13–14. The Director disagrees.

The 2017 shapefile is more recent than the 2013 shapefile, but it does not necessarily represent the number of acres TFCC may irrigate in 2023. The 2017 shapefile was a snapshot in time. It does not necessarily predict *future* irrigated acres. In compiling the 2017 shapefile, Department staff did not distinguish "hardened acres" —i.e., fields that have been permanently removed from irrigation—from fields that were not irrigated in 2017 but could be in future years. Hr'g Tr. vol. II, at 194–95.

The same is not true for the 2013 shapefile as explained by its author, a TFCC consultant named David Shaw. Mr. Shaw testified that when he compiled the 2013 shapefile, he specifically excluded hardened acres and included acres that could have been irrigated in 2013 but were not. Hr'g Tr. vol. IV, at 152–53. Unlike the 2013 shapefile, the 2017 shapefile includes only acres that *were irrigated* in 2017 and excludes the acres that *were not irrigated* in 2017 but *could be* irrigated in future years, e.g., 2023. This is a critical distinction because, as Mr. Shaw explains in the SWC's expert report, TFCC "has no way of knowing whether land covered by shares will or will not be irrigated and must prepare to meet the share delivery obligation." Ex. 4 ¶ 7, at 2.
