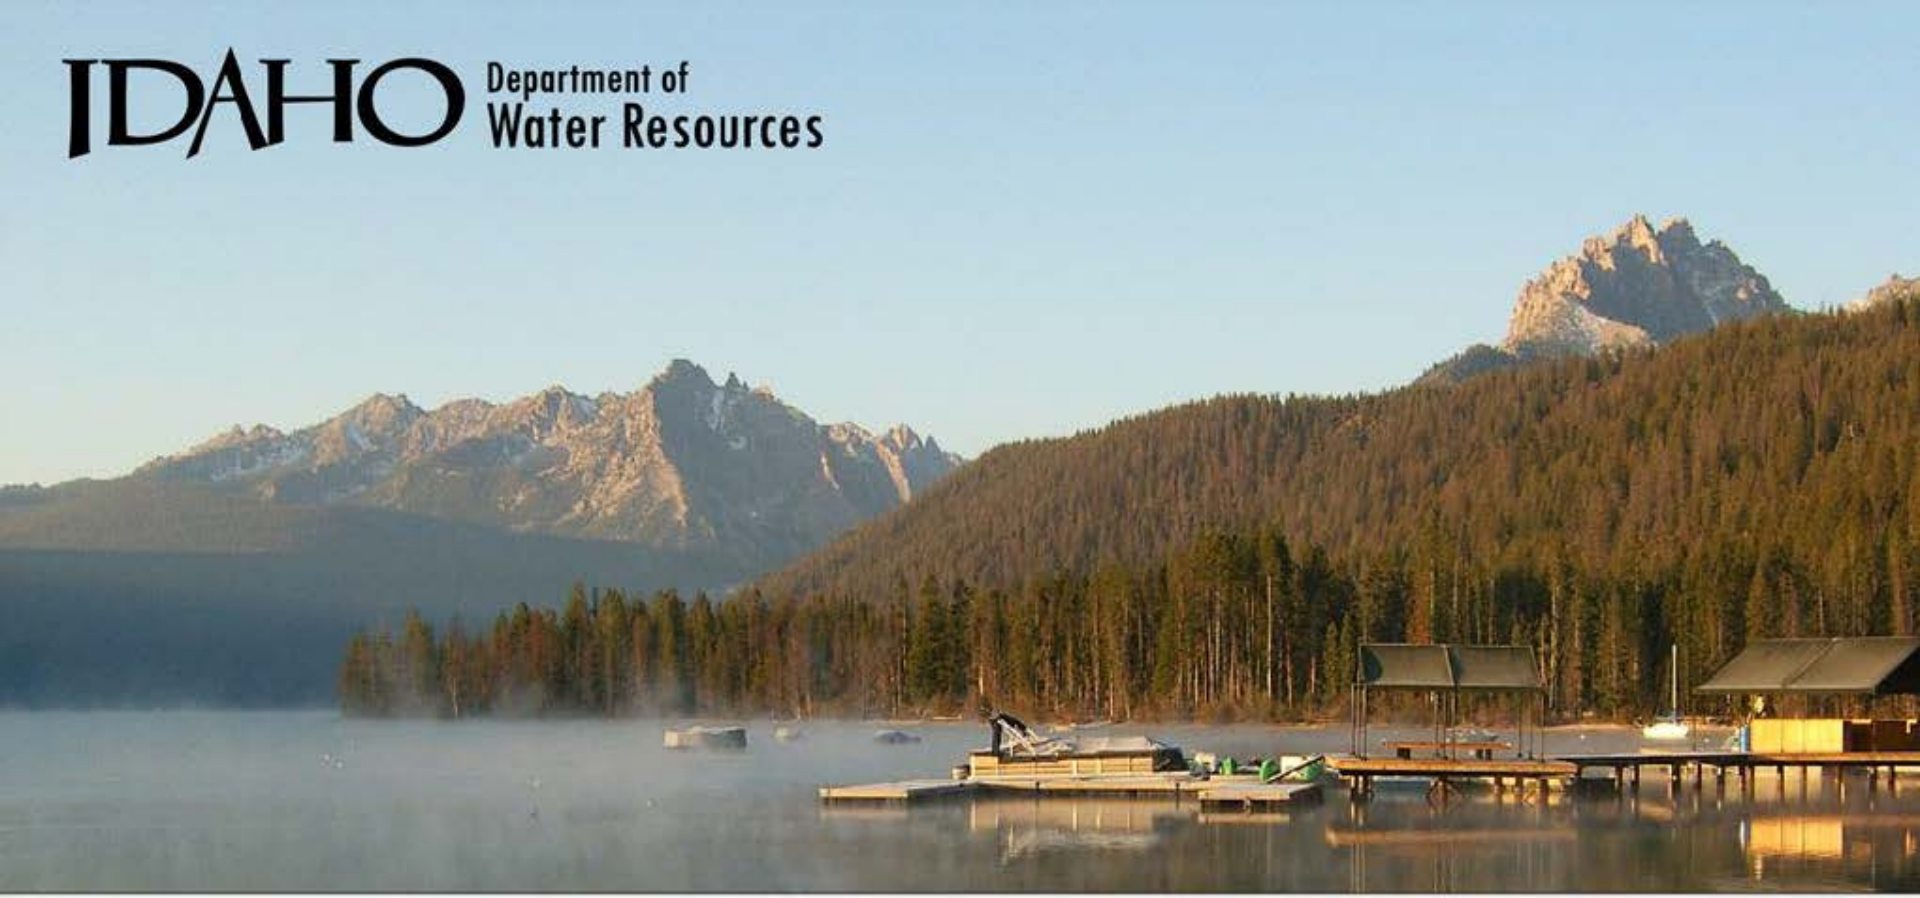
IDAHO Department of Water Resources



Wood River Valley Modeling Technical Advisory Committee
Response to Comments on Draft Modeling Objectives

Presented by Sean Vincent
August 1, 2013

Preface

- IDWR and USGS encourage active participation from MTAC members
- Comments constructive, thought-provoking, & deserving of response/discussion
- Response intended to generate discussion

Summary of Comments

1. Need to prioritize objectives
   - Facilitating Conjunctive Administration is #1 objective

2. Objectives are too broad/vague → be more specific

3. Preliminary 100m x 100m grid is too coarse

Response to Comment #1 (prioritize)

- Need to prioritize diminished since design requirements for the various objectives don't appear to be in conflict

- Facilitating Conjunctive Administration is important objective for IDWR but not necessarily so for the entities providing most of the funding (IWRB & USGS)

Response to Comment #2 (vague)

- Agree that draft objectives not terribly specific
- Draft objectives nonetheless accurate & useful for:
  - selecting code, solver, & river/stream package
  - delineating model domain
  - establishing requirements for defensibility & documentation
- Objectives also identify what we're not needing the model to do (evaluate well-to-well impacts)

Response to Comment #2 (cont'd)

- There are reasons to question the need for increased specificity:
  1. We don't know what Conj. Admin. will look like (& not our job to decide) → best we can do is look at ESPAM requirements
     - Quantify groundwater pumping impacts on river reaches
     - Determine priorities for curtailment/quantify mitigation benefits
     - Facilitate groundwater POD transfers
     - CAMP scenarios
  2. Spatial and temporal discretization likely will constrained by data availability, not by objectives

Response to Comment #3 (too coarse)

- For 100m x 100m grid cells:
  - 23,600 cells intersect WRV study area (larger, 1-layer ESPAM has 11,236 active cells)
  - Center pivot ~ 8 grid cells wide
  - ~256 cells to cover the area of 1 ESPAM cell
- 100m grid spacing likely exceeds defensible level of refinement based on density of calibration data
- Local grid refinement relatively easy w/ MODFLOW USG
